s:
>
>Is anyone aware of software that will emulate a TNC?

It depends on what you mean by "emulate a TNC". Your typical TNC can be
broken into three major pieces:

1. AX.25 link level protocol and user interface software
2. HDLC frame encoding/decoding
3. 1200 bps modem

Software is definitely available to do #1; I've written it. It's part of
the KA9Q "NOS" package. Although it was written primarily to support TCP/IP
over amateur packet radio, it does include a full-blown AX.25 and NET/ROM
implementation (the latter thanks to W9NK and SM0RGV).

However, there is no truly practical way to do #2 except in hardware,
which does not come standard with your garden-variety PC clone. HDLC
boards are available from several vendors (DRSI, PACCOMM, HAPN) that
plug into a PC bus. In the early days of amateur packet radio there were
software packages that emulated HDLC chips, but they were extremely slow,
clumsy, and prone to losing or corrupting data. Don't bother with them.

As for #3, the type of modem most amateurs use (Bell 202) is so obsolete
that it is now quite rare in the non-amateur world. Contemporary
telephone modems do NOT support this mode of operation, so you cannot
use it and be compatible with other amateur packet users. The HDLC
boards I just mentioned all contain on-board 202 modems, since they are
specifically designed for amateur packet radio use.

I recommend the plug-in card approach if you will always use your PC to
run packet, and especially if you want to use or experiment with higher
level protocols like TCP/IP. The "TNC" was designed for an erstwhile
era, when everybody used dumb terminals. It makes much more sense to
build packet stations around computers, not terminals.

I've redirected followups to rec.ham-radio.packet.

Back in my college days, at Steven's Tech (which I soon left, and went to and graduated from Syracuse U, a *real* college), someone at the college radio station WCPR (carrier current) found a joke version of the EBS test on some comedy album, and put it on cart. Later on, one of the jocks played it on the air! Instead of the dual freq tone, there was the sound of a flute. Good thing that we were not a *real* radio station broadcasting over real air.

In this age of "turtle madness" n1nja (unassigned) would be a good
'1'. :)

Some interesting letters I learned from a calculator game book:

6,9: G , 2: Z, 4 (as most people write it) Y or A

In the Russian alphabet, 3 is the character for 'Z' and would
also make for a good 'E robatne' (sp?)

When the FCC runs out of N's for Regions 4 and 6, where will they go
next? If they go to NA4AAA, think of what will happen when NA1's
are finally assigned!

Who got lucky on VHF Friday night? :)

I am interested in purchasing some used 2 Meter equipment
and wondered what I would expect to pay for 2M mobile equipment.
I know of an ICOM unit for $195, however it does not have
a touch tone microphone (TTM) which I want. I'm told it has
a standard 8 pin connection, and would accept other ICOM TTM's.
A catalog I have shows a couple close to $60, so the rig would
come out about $255. Is this a reasonable price for a 4 to 5
year old 45 watt 2M rig?

Note to hams in the Portland/Salem Or. area: Can anyone tell
me the name of the person that runs the Saturday morning swap
from 9 to 11 on 147.020? I believe his name is Doug and lives
in Salem. I evidently copied his call incorrectly and lookup
was for the wrong person. I've got a borrowed hand held, but
until license shows up (another 5 weeks or so) I can't give him
a call on the radio so would like to phone him. E-mail direct
to me if you know his name or call.

This would be logical, but from rumors, perhaps the FCC won't do this.
I've heard they intend to just let Tech's and General's be stuck with
the novice calls out of the KC4AAA and KC6AAA and beyond groups.

They might be holding the NA1AAA group for Communicator.

> invalid)!

I've gotten a couple E-mails on this, so I figured I'd post this. The side the IRC must be stamped on when you buy it is (I haven't bought one in awhile, so I hope my memory is good) is the left. To be sure, look at it. It's the side marked `imprimee de poste d'origine' or some similar phrase in French (the official language of the IPU) which stands for place of *origin*. The other side is reserved for the postmark of where it is *redeemed*. See why it matters now?

Ref QSL INbound bureaus.

I never knew exactly how to use a QSL bureau either. After many years of hamming, the DX bug bit when I was on an island in the Pacific and I could work lot's of DX without pileups, what fun!

Anyhow, I started getting DX cards and asked a local ham (the only other one on the island) about DX cards. He received about a shoebox full every couple of weeks, but he was a little more ambitious than I. He said he just sent the bureau a check and they sent him his cards and let him know when the money ran out. Sounded good to me. Not knowing the going rates for this service I sent a letter to the Willamette Valley DX Club (W7 bureau per the CallBook) along with a check for $20.00. They did not hesitate to cash my check, but I never heard from them again. When I left the island a few months later and moved to Michigan, I sent them a change of address and waited for cards. I had been told by someone that cards can take a long time, so I waited patiently. During that year on the island I had worked around 1500 DX stations and sent cards to the foriegn bureaus for most of them. After a year, I figured I had waited long enough and wrote another letter asking what the deal was. I received a package of about 30 cards several months later and a note saying my funds were more than adequate. That all was three years ago. I have not received anymore cards, notes, messages, nothing.

Has anyone else had experience with the Willamette Valley DX Club? Is this standard practice? Is $20.00 the going fee for one-time pack of 30 cards? Do they ever explain what their policy is or their rates?

Before thirty-seven of you refer me to back issues of QST, please no flames, but I like many other hams, am not a member of the League, and none of the local libraries carry QST, nor is it available on the newsstands.

How about it. Any members of the WVDXC out there to answer up? Anyone willing to post how bureaus are supposed to work? (Not just post references to read that we don't have access to?)

Thanks and 73,
Michael WA7SKG

3457. Re: CB in GB

Newsgroup: rec.ham-radio
Date: 1990-06-11 15:46:55 UTC
From: hugh_davies.WGC1RX@XEROX.COM

Source record: 11063

In V1 #15, <usc!snorkelwacker!mintaka!ogicse!littlei!foobar!jim@ucsd.edu>
(aargh!) asks;

<...The seller said it was a CB radio from England. Is this correct?...>

I doubt it. It sounds like it might have been a UK spec machine once upon a time, and someone has hacked it. Currently, the UK has two allocations at 27MHz. One starts at 27.60125MHz, and runs up in forty 10kHz channels to 27.90125MHz. The channels are numbered sequentially from the bottom. The other allocation, which is the CEPT European allocation, is the same as the FCC allocations (complete with that curious hop, skip & a jump). Both allocations are allowed 4 watts of FM from type-approved equipment into restricted aerials (basically, no beams). The UK allocation will be withdrawn at some point in the future, leaving the CEPT one, although no-one will pay any attention, after all, there are 500,000 rigs out there. There also used to be another 40 channels at 934MHz, but I believe this has been withdrawn to make room for cellular phones. The conversation's no more intelligent, but everybody involved makes more money.

<...Besides
the wider band coverage, the FM aspect intrigues me. I wish it was this way in the U.S. Instead of all the heterodynes, imagine how peaceful a "silent pileup" might be...>

Hah! In urban areas with 500 other people on the same freq as you, you can forget capture effect, especially since half a dozen of them will be running 400 watts into big aerials (why, Ghod only knows). And you still get heterodynes.

I just wish we could keep them out of 10 meters, since the UK CB allocation finishes just below the CW segment of 10. There are enough people who can hack the PLLs to give them access to all these "silent" (they can't hear the CW, and don't care anyway) channels. Sigh.

73, Hugh.

I am at work and don't have a CFR handy but I believe the reason the
FCC will not continue the N series is due to a conflict with another
service; the navy.

Part of A, all of W & K & N are assigned to the USA by the ITU. The
USA has in turn broken down what services can use which letters and
in what combinations. So, a 2x1 N call is not just arbitrary, it has
been designated for use by the amateur radio service.

3460. Gamma Match Problems

Newsgroup: rec.ham-radio
Date: 1990-06-11 16:12:13 UTC
From: U009@cs.cciw.ca
Message-ID: <5A060B0B0B1B0007-MTACY830*U009@cs.cciw.ca>
Source record: 11068

Hello net:
I have a problem trying to build a Gamma match for the driven element of a portable, knock down 2M beam.

I put together a 5 element, .8 wavelength NBS yagi as per the book (using 3/16 inch insulated elements). The frequency the antenna is designed for is 144.1 and since I want to use it on 144.2 I figure the errors aren't enough to require scaling.

The problem is in the matching of the driven element. I can't get the match down as far as I would like. (A similar driven element for 2M I built some time ago has a very good match although the construction is not exactly the same.)

```
------------+------------------------|---------------- < Driven element
| ---|--------------------
| -------------- ^ shorting block. ^match rod
+------- ^ Matching rod. extends beyond
^ ^ Capacitor. driven element.
Coax connector.
```

(The match rod bends evenly up from the cap to the shorting block.)

The shield of the coax and it's connector is connected to the center of the driven element (inside the boom, actually). The capacitor in the center conductor is formed by a piece of 3/16 inch brass tubing about 3 inches long and a 3/32 inch rod insulated with shrink wrap inside it. The rod then extends out to the shorting block where it connects to the driven element. The capacitor is parallel to the DE and approximately 1 inch away at the center but the rod bends in to about 1/2 inch separation at the shorting block. I find that the only acceptable match occurs when the rod is actually longer than the DE. There is about 8 to 10 inches of rod beyond the shorting bar in this case, and trimming it back increases the reflected power substantially. (I also had a similar problem with the match on the DEs of some K1FO 432 yagis I built a few years ago. They used a 1/2 wavelength delay to feed the T match and the match rods had to be 1/2 inch longer than the DE on both sides to get an acceptable match.)
I haven't been able to find any design "rules of thumb" for any type gamma or T match. What sort of spacing is reasonable between the match rod and the element? (The single driven element referred to above has about 1/4 inch spacing and a reasonable location for the shorting bridge. Also, the match rod is cut off just beyond the bridge.) Should I try to decrease the spacing? Should the rod be closer in diameter to that of the DE? Is this effect a characteristic of the DE being too short or long for correct resonance? The elements are all supposed to be

insulated. Would this effect occur if the outer conductor were shorted to the boom at the center if the DE?

From: sawyer@twg.com
Message-ID: <7278@gollum.twg.com>
Source record: 11069

This past Sunday (June 10) I had a qso with a person using the call ZA5DX. Normally, I'd write this off as a slim, but there are several things that give it a faint note of credibility:
- There was an article in last week's "DX Bulletin" that Zoli, HA?PP, is now in Tirana trying to get permission to operate as a ZA;
- Zoli (aka XU?DX, XU?CW, etc.) usually gets the calls ending in "DX" (for SSB) and "CW" (for CW);
- The ZA5DX I contacted gave Zoli's call, HA?PP, as the QSL route.
- The guy was experienced at working pile-up's, and seemed to have the same style as Zoli.

On the other hand, there were some slim indicators:
- This was a CW contact, and he was using the "DX" suffix;
- Later in the day I picked him up using the call ZA5CW--on CW;
- He got some modest pile-up's going, but nothing like I would expect a real ZA would generate;
- While the signal was coming from the right beam heading, it was a little too strong for the high A index we had, and I didn't hear many other Europeans quite so strong;
- He kept taking too many breaks, but he was on for quite a few hours.

Does anybody have any more information on this one? I surely would like to believe it's for real, but I'm already well on the way to "worked all pirates" and would just as soon note add a new one to my collection. Did anybody else pick him up?

Another data point, if people are still interested....

My first license (exam taken Feb 12th) took 5 weeks to the day to be
delivered in the mail.

My upgrade exam was passed thirty days ago today (May 12th). I'm still
waiting for my new callsign.

3463. Re: Phone line low voltage and poor audio problem

Newsgroup: rec.ham-radio
Date: 1990-06-11 16:24:16 UTC
From: billt@hprnd.HP.COM
Message-ID: <1140034@hprnd.HP.COM>
Source record: 11062

At my home there is an interface box between the Pac Bell line and my house wiring. Inside the box there is a standard phone connector which connects the output of the box to the house wiring. On the Pac Bell side of this box the line voltage is 48 volts. On the house side the voltage is 20 Volts.

All of my phones work fine with this Voltage.

I called Pac Bell about the low voltage in the house before I discovered the box was cutting the voltage in half. The technician I talked to was quite surprised that the voltage was anything other than 48 Volts.

Since you are doing something which is interesting, I suggest you try to identify the person who tried to follow up on what he did for you and establish a friendly relationship, like you were trying to get him interested enough in amateur radio to get a license. Such inside help should go a long was towards getting your problem fixed and make getting future help from the phone company a lot easier.

Good luck,
Bill

From: chris@hplvli.HP.COM
Message-ID: <20200002@hplvli.HP.COM>
Source record: 11066

Indeed the real message was sent back in the early
1970's. I was a poor university student working at
KOB radio in Albuquerque at the time, and though it
did not occur on my shift, I recall the incident
clearly. I believe that it was a Saturday morning,
and the message came over the AP and/or UPI wires
to the news teletypes. These emergency messages had
a certain format (10 bells in a row?) that set off an
alarm on the newsdesk. The skeleton staff on duty
at most stations did not event notice the alarms and
messages, or else ignored them. The message contains
an authentication code, which is to be compared with
the daily codes in a sealed envelope sent to every
participating station. If no occasion exists to cause
you to open the envelope (alert) then it must be
returned, unopened, to the coordinating agency.
Each envelope had code words for 1 or more months.

Some stations, fairly consciencious about their duties,
did see and act on the message right away, and alerted
their listeners. The rate of response was dismal, something
like 1% of all stations noticed and acted on the alert.

It has often been speculated that the "accidental"
sending of the real codes was itself a test, which
indicated that in the event of a real emergency,
you would not have been instructed about anything,
and the first warning most americans would have would
be the flash.

Sorry I can't get to Jim Carver direct.
Yes the seller was correct CB in the UK is FM. I'm sure you should get a reply direct from the UK detailing the channel allocations which are also different and do not have the spaces for remote control.
But it was decided to go FM, (which does make a lot good of sense) for several rumoured reasons, To get away from the thousands of illegal US type CB's, To allow all vendors to have an opportunity to supply the CB's, and just to be different !

I am listing two transceiver radios for a friend who wishes to sell them. They are as follows.
1) STS model AV7600VOR handheld 118.000 to 135.975 mhz
vor freq 108.000 to 117.975
manual included

2) Ten Tec TT920 Aviation band handheld good condition
no manual but manufacturer can provide one.

Please e_mail your offers. These are both excellent tools for emergency air to ground communications as well as navigation backups incase of nav equipment failure. Scanner fans will enjoy the programming features of both radios.

Thanks e Guinn

This doesn't really belong on rec.ham-radio, but the idea was not to
reduce clutter. The idea was to reduce the number of radio sources the
enemy could use for radio direction finding, to get a bearing on targets.
Remember this stuff was all pre-satellite navigation, etc.

> Europeans quite so strong;
> [Lots of other stuff deleted...]

Interesting that the beam heading was correct from 6-land. In New
Jersey, he was peaking at 315 degrees! I've never heard Europe come
in from that direction on any band! :-)

I know we should WFWL, but that beam heading was just too ridiculous
for words!

By the way, our local packet reported XU1SS/ZA and ZA2PL today.
The saga continues...

Now watch, it will turn out to be real...

Has anyone actually tried cashing an IRC? Are the USPO staff as clueless about cashing them as they sometimes are when you buy them? Some of those folks seem to have a hard job reading English, so the French on the front must be a real challenge for some of them.

One thing that's useful to know is that if the IRC originated in the USA you can cash it for 1 cent less than the face value. The others get you the equivalent of an overseas stamp for surface mail - so in principle you cover the return postage for a QSL card with one IRC, if you don't mind it coming back via surface mail. In my limited experience as a QSL manager, I always reply airmail if I am sent one IRC - the IRC is worth 45c to me, which is the overseas air postage rate, and although you may lose out by the cost of the card, that happens anyway when you reply to a USA card with an SASE. But then I'm just a Good Guy... (and I didn't buy the cards :-)).

I have this, er, friend, that has a number of IRCs that are incorrectly stamped (no stamp, or it's on the wrong side). This friend would feel happier cashing them in for 40c than sending them to DXers who might regard them as worthless. Are the USPO guys clued in? Of course, IRCs are rarely cashed, they get sold or traded for QSL cards, but when a new issue comes out someone must be left holding the baby. How much notice do we get when a new issue is imminent?

Happy QSLing -

There are lots and lots of used sat receivers out there. Since the
advent of scrambling, anything that doesn't have a built in descrambler
goes for cheeeeeep. You should be able to pick up the whole kit for
two hundred, minus the dish itself (receiver, down converter, lna, feedhorn).

I've even got one on the shelf.

>Does anybody have any more information on this one? I surely would like to
> AA6KX
Here is an interesting piece of information. On Monday, I was discussing
the slim with Guy, KE2CG. Guy told me that at the moment the ZA was
posted on the packet cluster, he (KE2CG) happened to be in qso with Zoli, HA5PP!
He told Zoli about it who got all excited-" Yeah? where is the guy, I
want to go work him!"

According to most sources (including Guy, which is only third hand)
Zoli's trip was purely exploratory, he brought no radios with him,
and was a big success. He obtained official permission to operate
from Albania, and should be on the air within 2 to 3 weeks.

Then you can work the real thing!

You know better than that. If that was an attempt to be sarcastic, you
missed.

It's an iffy question: ham radio itself cannot be used for commercial
advantage, but the FCC has stated that buying and selling your own
personal ham equipment isn't a commercial enterprise and so mentioning
items in your shack that you'll trade for dollars (:-)) isn't against
the regs. That might be relevant to how we treat the info-hams mailing
list and rec.ham-radio newsgroup.

The newsgroup is a Usenet newsgroup, and as you know, anything goes on
usenet. There is a ham swap newsgroup that is probably more appropriate.

The info-hams list isn't hosted on a Milnet site anymore, but at UCSD, a
non-profit organization. We allow people here to put used equipment
notices up on the various paper tack-boards around campus, and there is
a swap column in the campus paper, so I'd suspect there's no rabid
anti-money feeling by the administration as a whole on the subject of
personal items for sale. I don't have an official policy decision on
that and I'm loathe to ask. The various networks over which the
articles travel undoubtedly have some sort of policies of their own.
A few months ago someone (Dave ?) resigned from the mailing list
in a flaming Pyrrhic stroke claiming that it was illegal for his site to
carry for-sale ads. So I've no solid feeling to go by.

I suspect that no reasonable person will mind an occasional mention
that you have something that you'd like to part with by trading it for
happy little bits of green paper, but I really don't want to encourage
that because for some reason it really upsets the less stable element,
particularly those at MILNET sites (although at the rate that mail is
failing to hosts on the MILNET, they may never notice!).

So I'd like to encourage people to advertise ham radio items for sale
elsewhere, and if you do see a message from someone ignorant of that
guideline, please just GENTLY mention in a COURTEOUS way that it would
be better for all concerned if they didn't do it again here.

Is this a reasonable policy that all can deal with?

>to be normal.
>The service rep response to this voltage comparison was that "the company
>doesn't gaurantee the line voltage.

Telco tolerances have a fair amount of leeway.

In general, a telephone line can have well below 48 volts and still be
within what the telco deems acceptable. If you live more than a few
cable-miles from the central office, you should expect it! In some
cases the telco will have a mux out somewhere, so you're not fed
power directly from the CO but from someplace closer, at whatever
voltage you end up with (usually okay). That can account for
differences among different lines in a neighborhood.

The audio level is what counts. If you dial the milliwatt test number
(usually nxx-0010 in CA), you'll get exactlly 1 mw. at 600 ohms (or is
it really 900?). It's "normal" to have 3-9 dB loss in the wire, so
if you get less than -10 dBm or something, using a properly calibrated
test set, you may have a problem. Low voltage per se does not mean low
level; it could just be the nature of your battery feed and wire
combination.

It's also possible you are just on too thin a wire pair (maybe part of
the way), or they're using a really bogus mux (like the "AML") which
normally delivers inadequate levels. Have fun getting telco to own up.

3484. DOVE query

Newsgroup: rec.ham-radio
Date: 1990-06-12 20:44:02 UTC
From: lrj@ishtar.cs.cornell.edu
Message-ID: <42092@cornell.UUCP>
Source record: 10993

I recall a question posted here some time ago as to the current fate of DOVE, but never saw any replies. Does anyone know what's up with it? I also remember hearing that someone was uploading new software after the transmitter problem. What's the story?

Also, many thanks to all who helped out with the problem with my FT-101EE rig, especially Mark Bitterlich and Dube Todd. The problem is apparently a "classic" case of bad finals. When I get some time, I'll replace them, neutralize 'em, and see how it goes.

From: cduncan@jato.Jpl.Nasa.Gov
Message-ID: <4011@jato.Jpl.Nasa.Gov>
Source record: 11000

There was no transmitter problem with DOVE, a software problem caused the two meter transmitter to lock on making it nearly impossible to command.

Once control was regained, it was left executing from the onboard ROM loader (MBL) with the S-band transmitter only turned on. It has been reasonably healthy and safe ever since. The S-band transmitter is on 2401.2205 MHz.

At the moment, DOVE is top priority for microsat software development. A software reload (using the under-modulated S-band transmitter for return acks and nacks) was to have started last weekend. As soon as we're absolutely sure everything is right, the two meter transmitter will be re-activated. Shortly thereafter, some digitalker messages will be tested.

We are aware of the tremendous popularity and potential for DOVE with its two meter FM transmitter, therefore we have to be incredibly careful in developing, and later managing its operation.

I'm looking for a ham radio group called ASTUR (or something similar to
that) which is supposed to have PD disks with various ham radio programs for
the Atari ST.

The address which I have used before doesn't get a reply even with an SASE.
Does anyone know if they still exist, or of a site I could download from?

In particular I need a graphics oriented great circle program and any new
WEFAX stuff that might be out there.

Thanks in advance.

3489. The bands are dead!

Newsgroup: rec.ham-radio
Date: 1990-06-13 01:51:47 UTC
From: flash@lopez.UUCP
Message-ID: <1990Jun13.015147.4993@lopez.UUCP>
Source record: 10985
Cross-posted to: rec.radio.shortwave,rec.ham-radio

The title says it all. I just sat down for a nice peaceful evening of a little SWL'ing and Hamming (I do both)... AND the bands are dead, at least up here in the aroural zone (Marquette, Michigan, the land that time forgot)... When I say DEAD, I mean Dead. I can not get WWV anywhere. 75 meters is totally gone. SHORTWAVE stations sound like they are under water, and nobody is higher than S-2. Surprisingly, W1AW was there at 0130 with their bulletin on 21329.8 (announced 21390, they can not get closer to the freq than good old Glen Baxter can)...

Is it just ME, or is this the WORST solar peak you can remember. I mean dismal dismal dismal. Sunspots are supposed to being exciting stuff to the HF bands, but what the sunspot giveth, the solar flare taketh away.

Previous solar cycles brought me some great SWL reception, and wonderful memorable ham contacts with coathanger antennas all over the world.

Not so this time. This cycle has been a bust IMHO. The bands have been literally DEAD for days on end. No communication in or out. This is my THIRD solar cycle as an active radio nut. This time I have much more sophisiticated equipment, AND more time to play with it than the last two... (Well I used to skip school to play TV DXer when the e's came alive back when I was a kid...)

I have had very few memorable days playing with DX this time around. What I remember the most from this cycle is the total trashing of the bands many many many times. Some of it is the black hole effect (as posted previously) but I am sure that this dismal reception must be affecting others as well. Days when the band is "broken" seem to happen far more regularly than I can ever recall.

Thank goodness that usenet is not affected by solar flares (to a GREAT degree, though I blame a big one for bring lopez down... gotta blame something...)

Not too long ago several articles were posted by individuals who had successfully modifed their PRO-2004 or 2005 so that a computer could input frequencies into memory. I attempted to email questions to whoever posted the articles, but my site's outgoing mail got hosed up and dumped instead of being sent. I would really like to modify my PRO-2004 for as much computer control as possible. Would anyone who has done this please post or email directions on how you did it. 73

You hit the nail on the head here! The Post office is usually not
fully aware of IRCs' unless you go to a big one, and catch the right
clerk at the right time. Usually, they are more than willing to
resort to a huge manual, and after a few minutes, determine that it
is 40 cents per each dx IRC (which is why I usually sell them to
other hams .....)

>
> One thing that's useful to know is that if the IRC originated in the

> if you don't mind it coming back via surface mail. In my limited
> experience as a QSL manager, I always reply airmail if I am sent one
> IRC - the IRC is worth 45c to me, which is the overseas air postage

SOMETIMES! If you read the fine print, you can only get 1cent under
face value if you are the purchaser of the irc! I recently returned
from Singapore with a few hundred of these type of IRCs...and it
took several trips to the post office before I was able to get 94
cents for each one. Usually, they tried to give me 40
cents...only once did the 'fine print' come into play. Face it,
IRCs are a darn hassle!

> I have this, er, friend, that has a number of IRCs that are incorrectly
> stamped (no stamp, or it's on the wrong side). This friend would feel

> are rarely cashed, they get sold or traded for QSL cards, but when a new
> issue comes out someone must be left holding the baby. How much notice
> do we get when a new issue is imminent?

I think the last time the issue was changed, there was a few year
redemption period...this was about 10 years ago, i recall.
Sometimes a post office will redeem 'improper' stamped IRCS. I know
that some QSL managers sell this kind of IRC for the normal 50
cents....which has led to a bunch of moaning about 'salting' the
good IRCs they sell with bad ones. I personally pitch them, or
return them with the QSL card with a stock note saying...these ain't
worth the paper they are printed on. In almost every case, I

usually get a note with either 2 (or sometimes more?!) IRCS in return that are GOOD, or a Green Stamp, or whatever. Most hams (and post offices) are uninformed of the proper method of issuing a IRC. It MUST be stamped on the left side (which says "Empreinte de controle du pays d'origine (date facultative).

cheers

3494. Packet Radio in The Middle East

Newsgroup: rec.ham-radio
Date: 1990-06-13 08:17:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9006131506.AA25225@ucsd.edu>
Source record: 11008

How's your digital communications system doing these days ???
I'd be happy to hear about your system's capabilities/developments.
please direct your responses to the net or via E-mail.

Some info about Packet radio here in the middle east...

- The main frequency on VHF is 144.675.
- There are 3 active BBS's on this frequency in Israel and one in Cyprus.
4Z4SV - JERUSALEM
4X4HF - HAIFA
4X1RU - HERZELIA (VHF-HF Gateway)
5B4TX-6 - CYPRUS

- TCP/IP is used extensively by about 30 percent of the 200 or so active
Packet stations.
- There are 10 active NETROM digipeaters scattered throughout the country.
- The BBS's use RLI or MBL software at 1200 baud. Each BBS has an additional
port for TCP/IP
- Visitors are welcome to use the system to pass traffic back home.(Overnight
delivery most of the time !) A laptop, HT and small TNC will get you
country-wide coverage - from your mobile.
- Work is being done presently to have links done on UHF at 9600 baud.

Anyone using Full Duplex BBS's (with a dualbander-this sounds possible) ???

73,
Richard Harel
4X1DA

A major flare occurred at 0541 UT, 12 June
A major geomagnetic storm began at 0820 UT, 12 June
A satellite proton event began at 1140 UT, 12 June
A polar cap absorption event began at 1545 UT, 12 June.

Last night (around 0300 UT), I couldn't hear WWV on any frequency, but
there was still a lot of other SW activity on the bands at regular
strengths.

Beautiful very pale green aurora seen from Fredericton. Quite
extensive; some patches directly overhead.

Also, the X experimental call reservation does NOT seem to apply to N series calls, since here in California, I started hearing a number of tech/general N6X** calls (by September, all the N6*** calls will be used!)

I tuned through 20 meters this morning at ~5:30 just to see if it was
worth getting up and heading for the shack. I drew a complete blank.
Many mornings over the last week or 2 it has been wall to wall with
Australia and New Zealand, some of them running 20-30 watts. You
can't get much more DX than that from the east coast.

Last week I picked up a British station working mobile (mid afternoon our time)

It has been boom or bust, but the booms have seemed pretty good to me.
Now I just have to get my antenna outdoors so I can get out a little better.

Maybe I wasn't clear enough... I made this mistake also...

Turn off the radio..
Hold down the Light, B and # keys (it isn't easy)
While holding down these keys, turn on the radio (even harder for two
handed people!!!)

THIS IS THE IMPORTANT STEP

**** DO NOT RELEASE THE Light-B-# KEYS UNTIL THE SELF TEST IS OVER AND
THE RADIO IS DISPLAYING A FREQUENCY ****

If you release the keys before the display has settled down, you won't
enable the wide-range receive.

Or maybe you have a very early unit that requires the removal of a diode.
My unit has a serial number in the 1900's, I am told (by a good source)
that the 'first' batch of IC24A's required the diode to be removed.
All other batches (from Japan) don't require the diode to be removed (of
course, they could change this at any time!).

Also, keep in mind.... this was done on the IC24A... The dual band 144/440MHz
handheld.... I have not tried this on a IC2SA/T, IC3SA/T, or IC4SA/T.

The combinations that change the number of digit-frequency-entry did work on
an IC3SAT, but I beleive that unit had a diode removed to enable some

'extended' frequencies. If I had an IC2SAT, I might try removing the 'programming' diodes (they are very obvious), and 'see' what happens... One could always replace them (I hope) if the effect was not desired.

Good luck... My wife (WG1G), still won't let me near 'her' radio... she loves it.... I guess I will have to get one of my own!

Hope this helps,

Rich

My wife recently (June 4th) received her Extra ticket (WG1G)... this was done through a VE upgrade... She received the ticket in 6 weeks (almost to the day).

Another local Amateur (WF1W), received his license in exactly 3 weeks, this was a call-sign change only (610 form sent directly to the FCC).

Local Novices have been receiving their ticket in 5-6 weeks.

Gee, how come when I was upgrading, I had to wait about 8 weeks!! Looks like I missed about 2 weeks of Amateur Radio activity :-)!!!

From: cep@cci632.UUCP
Message-ID: <38031@cci632.UUCP>
Source record: 11013

In the callsign database, is it really necessary to have both the issuance date and the expiration date? With universal 10-year licenses, I have only kept the expiration dates and have stripped out the issuance date. This _seems_ pretty safe to me, and that if I want to know when the guy got his license, subtract 10 years from expiration. I want to know if there are any caveats or glitches that I am missing in this assumption.

Each Incoming QSL has its own rules, so what I am about do post is only guaranteed to represent 3rd call area policy. First, to get a copy of our rules, all we ask for is an SASE. We operate strictly on an SASE basis. You send us SASEs (5x7 clasp envelopes) with at least one unit of postage. If you expect larger volumes of cards, you can put extra postage on the envelopes. As soon as the weight of cards on file at the bureau matches up with the postage on your envelopes, we drop it in the mail to you. We stamp or write last envelope on your last envelope when we mail it to remind you to send more SASEs. As a courtesy, we send a onetime postcard to hams who have cards on file at the bureau, but no envelopes. If they don't send the SASEs within 45 days of notification, the cards are discarded and a note is made in the file to discard all future cards. Believe it or not I have over 6 pounds of cards for one very active DXer that will soon be pitched if he doesn't get his act together. Hope this explanation helps. BTW, I would send your bureau a letter with an enclosed SASE and ask for an accounting of your funds. 73

I had the opportunity to purchase a Yaesu FT73R UHF handheld.

This radio had been modified BY SOMEONE ELSE to operate as the commercial version FTH-7005. We have tried tuning it back to the ham band but can only make it transmit there, not receive. We could not see a jumper anywhere.

What we need to know is what do we have to do to REVERSE THE MOD and get it OUT OF THE COMMERCIAL BAND. The Canadian distributor couldn't help.

Anyone out there have any info?

> all these extensions and enhancements that have been build up around this
> simple exchange, I really don't understand what the details are.
>
> Just who is a "QSL Manager"?
He is someone who handles cards for another ham. Many times it is someone in the USA who handles QSLs for a DX ham. The foreign ham says "QSL VIA W6XYZ", and then sends W6XYZ copies of his log. If you want the DX QSL, you send an SASE to W6XYZ along with your QSL, and he sends a card back for the foreign ham.

Who takes on such a job and why? Are they
> "appointed" by a foreign ham,

YES.

and are there people clamoring to get
> these positions,

NO.

or are they people who volunteer to experience drudgery
> and annoyance for the sake of a foreign ham who is a personal friend, or
> what?

YES.

Is the usual thing that one person is a "QSL Manager" for many
> foreign hams, or is this a one-to-one thing normally?

It can be either. Some QSL managers do it for many stations.

Are there "QSL
> Managers" outside the US, or is this something that is US-unique?

Yes, there are QSL managers outside the USA. I think that most of them are here, just because there are so many U.S. hams who are in the pileup collecting cards. But a QSL manager can be anywhere. Going through a manager in a foreign country is not as easy, because you need to send a donation rather than an SASE (unless you have a

collection of foreign postage).

>
> What is a "bureau"? Who runs it/them, and why? Does each country have
> one? Do they have any "official" status, like being registered with that
> country's FCC-equivalent?

Here is how a bureau (or BURO) works. They are not registered or regulated,
but are generally run by the national ham radio organization in the country
that they are in.

In the USA we have a bureau for each call area. You send a 5x7inch
envelope to the bureau with several ounces of postage on it, your
return address on the front, and your callsign in block letters in
the upper left corner. Actually, send several. The addresses are
printed in QST a couple of times per year, are also in the ARRL
Operating Manual, and are in the DX Callbook. They file it in
alphanumeric order, and when they fill up an envelope (or a long
time has passed with no more cards) they seal it and drop it in the
mail to you.

Overseas hams send bunches of cards directly to the ARRL HQ, and they
are then distributed to the regional bureaus. Every month or so the
volunteers at the bureaus sort the cards and mail them.

For outgoing cards, you can send these direct, send them to the
incoming bureau for the country, or use the ARRL outgoing bureau
(if you are an ARRL member). The outgoing bureau is great. You
pay $2/pound, sort your cards alphanumerically, and send them
off to ARRL HQ with your QST mailing label. At HQ they sort
them by country, and ship huge boxes of cards to the incoming
bureaus of each country. This is the cheapest way to go, and
will work for most run-of-the-mill overseas contacts, EXCEPT
when the recipient is not using the bureau in his country,
or only uses a QSL manager.

Note that the outgoing bureau is in Newington, and you incoming
bureau is somewhere in your call area. When you move to another
call area but don't change calls, you still use the bureau in
your old call area.

.>
> When did this stuff start? Any history notes or comments?

It just sort of evolved.

>
> Post responses, don't mail them; this should be of interest to all the
> people out there who post "how can I become a ham?" or similar new-guy
> type queries.

OK. I hope this helps.

Ask the ARRL for copies of their sheets on the OUTGOING QSL BUREAU and the INCOMING QSL BUREAU. Their address is ARRL, 225 Main St, Newington, CT 06111.

You can also reach them via e-mail from usent at:

This was an issue in California now that the N6aaa calls are nearly exhausted.
It was unclear whether or not the FCC would issue N6Xaa calls. But, my YL
recently got her Tech and it has an X suffix. So, it appears that there are
no 1x3 N calls reserved for experimental use.

From: flash@lopez.UUCP
Message-ID: <1990Jun13.224546.15798@lopez.UUCP>
Source record: 11023
Cross-posted to: rec.ham-radio,rec.radio.shortwave,rec.radio.noncomm

First we had CONELRAD. If you have a radio made in the 1950's, you will still find the little circle with a triangle in the middle of it at 640 and 1240khz.

In the late 1960's, I worked at a station that happened to broadcast on 1240 KHZ. Though EBS had taken over, and conelrad was no longer used, I still used to say "Where Listening is HOT on the CONELRAD DOT" as a funny one liner.

Anyway, Back in the 1960's EVERY SATURDAY MORNING, at exactly the same time (10:30 or so I do not recall the time, except that it was EXACTLY the same time every week) the UPI machine (In those days a klunking thumping mechanical TTY) would go into spasms. There would be 10 bells: BINGBINGBINGBINGBINGBINGBINGBINGBINGBINGBING and a row of

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

and ten more bing bing bing bells....

And then:

EMERGENCY BROADCAST SYSTEM TEST...

THIS IS A TEST OF THE EMERGENCY BROADCAST SYSTEM

And a test message would follow.

We were required by the FCC to save these tests, and staple them to the station logs.

There was a "hook" (nail on the wall) where news was sorted, and the first hook was for EBBS tests.

They came during our local top 20 program, where I played the station's most popular songs as tabulated by requests of the past week. It was a busy shift, and "Tearing the wire" was mixed in with answering the phone, being the station's engineer, and drinking lots of coffee. At that small station in Ishpeming Michigan, I was the only employee there on saturdays.

Pegging the EBBS test was part of the routine.

So when I heard the bells go off, and the RED LIGHT above the console go on (Stepper relay wired to a BIG TRUCK TAIL LIGHT whenever the bell rang more than 8 times within a 30 sec period), I would go out and rip off the test, and stick it on the wall, and go back to playing the hits.

Well, to my surprise a half hour later, when we joined the NBC network, I was informed that a mistake had been made, and AN ACTUAL EBBS ALERT had gone out.

I ran to the hook and saw:

UPI

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

EMERGENCY BROADCAST NETWORK ALERT *** THIS IS NOT A TEST *****

THIS IS NOT A TEST. THIS IS AN ACTUAL ALERT. THE UNITED STATES

IS NOW UNDER ATTACK. ALL STATIONS ARE REQUESTED TO BROADCAST

THE EBBS WARNING MESSAGE. STATIONS NOT AUTHORIZED TO TRANSMIT

DURING A NATIONAL EMERGENCY ARE ORDERED TO LEAVE THE AIR. ONLY

AUTHORIZED EBBS STATIONS WILL TRANSMIT. FURTHER INFORMATION

WILL BE FORTHCOMMING

THIS IS NOT A TEST

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

I was absolutely flabberghasted. We did not have a xerox machine back in those days, or I would have a copy of the exact message in my files here (the above is only a very rough reconstruction of what I read.

Of course NBC mentioned that hardly ANYONE complied with the message as most people either figured it was a mistake, or did not even notice it (like me) because it came at 10:22 PM EST which was the standard test time.

This got me to speculating that if the RUSKIES (back then THEY were bad guys, not our huggy pals like in modern times) wanted to blow up the country, all they would have to do is plan the "big one" for just after 10pm on a saturday morning.

This incident caused a total revamp of the WIRE EBBS system, and I imagine someone lost his job over it.

Was anyone else working in broadcasting back then (It was 67 or 68 I think) on that fateful Saturday Morning? Does anyone have the text of the actual message that so many of us pinned on the wall without reading it because we saw the row of XXXXXXXXX's and went back to our business?

Radio. It was a wonderful Job. God, I'm glad I got out of it....

From: MULTI@TRIUMFER.BITNET
Message-ID: <90Jun13.180940edt.57942@ugw.utcs.utoronto.ca>
Source record: 11019

While tuning into an antenna with high SWR, my Yaesu FT-101B suddenly delevoped the following bug. The plate current refuses to dip on all bands except 10 meters, where it dips over in the 20 meter position. Output power is similarly low (10 watts or so) on all bands except 10 meters, where it peaks at 70 watts. ALC, drive, and plate current appear adequate, so I am somewhat reluctant to blame the final 6JS6C tubes. Ideas/Suggestions?

>..I mean at least the bootleggers over there all speak English, here they
>all speak SPANISH! ;-) Heheheh! Time for t-hunts, time to write down some
>addresses..start harrassing 'em back!

I've heard of CB bootlegging for a while. I've heard things that have
me a little confused though. It it people with CB radios modifying
them to work on the 10m band or the other way around? I really don't
see why a 10m operator would want to try to move onto CB...

Also, if a CB radio is on 10m, it's going to be in fullwave AM right?
If you are tuning around on your receiver in SSB mode, will you
receive it? Certainly you will hear something, but will you be able
to dial it in so that it becomes clear? I believe I heard a fullwave
AM signal once, I forget where (it was in a ham band). Does this
always mean trouble?

Is it really possible to DF these things? Especially if there is a
lot of skip propagation going on.

Announcing new HAM!! WB0GPX

My friend bought the Yaesu FT-411 handheld.

I confess, I haven't been following the posts about how to access the
MODS database. The current set of information on my system doesn't
contain any info on the MODS database.

Please post how to get to MODS, or how to mod the FT-411.

Thanks,

..I mean at least the bootleggers over there all speak English, here they
all speak SPANISH! ;-) Heheheh! Time for t-hunts, time to write down some
addresses..start harrassing 'em back!...>

Nice idea. Unfortunately most of the "bootleggers" actually speak Italian, not
because the UK has a large Italian bootlegger population, but because Italy
has a *HUGE* CB community, and with 10 meter propagation the way it is,
they are usually 50 over 9 here. Most of them are running about 5kW erp to
talk to their friends 2 miles away. Why do you think most of the CB "linears"
available are made in Italy?

My limited experience this cycle indicates that the bands are not really dead...in fact this is a much better peak than the last one, which was a real bust (smoothed max sunspot count of only 90 or so, monthly average; this one came out to about 150, as I recall reading somewhere). Solar flares do cause trouble, as you note, and we may well be past the peak. We can only hope it's going to be a bimodal this time...

BTW, my experience has been that except for disturbances, the bands always have some life to them...I've heard 10m openings during sunspot valleys that would surprise anybody. It seems that what really happens is that everybody says "cycle peak is over, p*ss on hamming", and doesn't even try.

> Thanks and 73's
> Jim, WA6SDM

I'm sorry to be the bearer of bad news, Jim, but the data you are looking for doesn't exist. To be sure, a lead-acid battery does exhibit a *slight* decrease in cell voltage as it discharges, but the specific values depend on battery age, cycle history, maintenance history, etc. Your only hope would be to characterize each individual battery of interest to you. And then, those numbers would only be valid while the battery was at chemical equilibrium with no load.

The best (and sometime only) way to determine the state of charge of a lead-acid wet cell is to measure the specific gravity of the electrolyte.

Best regards,
Dan Blake

I have this old mobile rig from the good ol' days of crystals. It's the Yaesu Sigmasizer 200R. A 2m rig with about 50 crystals in it! Looking back in some old QSTs, it seems to be from about 1975. This rig was thrown in with the deal a couple o' years ago when I bought my Drake TR-4C.

The radio works excellently, with the exception of a couple frequencies. This may just be bad crystals, but I would like to ask if anyone has the manual and/or schematic for one of these. It's a great rig, and I plan on using it until I can afford something better (and after that I'll still use it for SOMETHING!).

Also... you Drake owners out there... how about letting me know if you have any mods for the Drake TR-4C. Also, I would like to know what the optional 34PNB noise blanker was made of (ie-could I make one myself or will I have to find this at a swap fest?). There is simply a jumpered tube-socket where this blanker goes.

Thanks for the help and please post to the list, because I am in the middle of account switching!

Message-ID: <5A060F0811360201-MTACY830*U009@cs.cciw.ca>
Source record: 10938

Larry was asking about the possibility of recovering Gel-Cells. I have not had much luck with totally discharged cells. The Gates application book I have indicates cells should be re-charged if the cell voltage drops to 1.8 or 1.6 volts(I can't remember exactly) after sitting on the shelf. During actual discharge, the voltage can be permitted to fall to lower values as long as the cells get re-charged reasonably quickly.
Some cells will pass current with very high voltages (40 or more) and can be partially recovered, but not completely. The cause is apparently insoluble lead salts forming a high resistance in the cell if it remains in a discharged condition for too long. This is probably irreversable.

All that said, I am looking for a couple of BC cells in reasonable condition (2 volts, 25 AH) and reasonable price to complete a 14 volt battery. If you have a lead for me (or a lead cell- hi hi), please write.

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),

->
-> This sounds a lot like a receiver with a Blocking Dynamic Range of
-> over 180dB. If such a receiver is found, Greg, let us know...and let
-> us know the price.
->
-> 73, Dube Todd N5PDK
Perhaps I phrased this badly. The receiver does not have to FUNCTION with 1000 volt input, merely not be damaged by it, and to recover immediately (in a few microseconds) as soon as the overload is removed. Most commercial receivers I have tried either suffer damage or block for several seconds following a gross overload. The signal I am looking for occurs in the few milliseconds following the overload. I think a tube front-end is probably essential - probably related to the electronic t/r switches used by some CW operators to achieve instant break-in.

3539. Re: Battery Charge Info Wanted

Newsgroup: rec.ham-radio
Date: 1990-06-15 16:15:37 UTC
From: <>
Message-ID: <15780004@.HP.COM>
Source record: 10943

My Gates manual shows the following voltages. The line is linear, so
any other points are easy to calculate. Gates notes that the actual state of
charge will be within 5% of the chart if the battery has not been charged or
discharged for 24 hours.

Charge 0 25% 50% 75% 100%

Cell
voltage 1.975 2.025 2.075 2.125 2.175

Note that this is open circuit voltage. The actual discharge characteristics
are also relatively linear (except at the end!), but both of these voltages
are temperature dependent. The Gates data sheet shows that the capacity varies
from 50% of nominal at -40 deg C to 103% of nominal at 60 deg. C (nominal is
at 25 deg. C). Most of my experience has been with the Gates batteries, so
other batteries may have different characteristics. You might try writing to
to the manufacturer of your battery for a data sheet.

Date: 1990-06-15 17:52:51 UTC
From: fnddr@acad3.fai.alaska.edu
Message-ID: <1990Jun15.175251.4080@hayes.fai.alaska.edu>
Source record: 10945

We need a filter for a low-noise preamp in the 440 MHz range. Mostly it needs to have a flat passband about 5 MHz wide, and steep rolloff, especially on the low end. Can anybody suggest a solution that is more clever than your standard LC configurations? Sharper cutoff, less insertion loss?

I'd like to find some good books dealing with VHF/UHF design techniques... my library covers HF and microwaves but has quite a hole in between. Suggestions are welcome.

In metropolitan areas (like L. A.) weak signal VHF and UHF users (satellite
operators) often use cans. There are cans (duplexers, single filters, etc.)
for 440 MHz. Have you considered these? They are very sharp.

doug@NISD.CAM.UNISYS.COM (Doug Hardie) writes:

>Once again the number of for sale message has started to rise. Now that
>Arpanet is gone, does that mean that this is a commercial media for any
>commercial use I might desire?

>-- Doug WA6VVV

This brings up an interesting caprice of the net. In the past when a for sale item showed up in the ham-radio group there were angry comments from the arpanet side and threats to close the gateway. Meanwhile on comp.os.cpm there are for sale articles on a daily basis but if a long source code file appeared there were angry comments from the Arpanet side and threats to close the gateway.

I have noticed the occasional long ham-radio posting in the past (yes even the occasional source listing) but they are greeted with nary a whimper.

What is the Arpanet policy? Is there a policy? Is this all dependant on the perspective of the gateway manager? So it appears out here in the land of little sticks.

Rather than petitioning the FCC for new regulations that cannot be enforced, the users of CB need to arrive at a "gentlemen's agreement" about an advisory channel. I would think 19 (or 9 if it is life-threatening) are already for this purpose.

This presupposes that a traffic advisory channel is effective. I suggest attempting to hold a "traffic net" on a particular channel, plus advertisements on other channels. It may be that nobody has their CBs turned on !

Frankly, I'd be surprised if the anarchists on CB would allow such a useful service.

I've been noticing this too for the past week or two. I'm in San Diego,
about 30 deg. north latitude. If I'm lucky I can hear WWV on 15 MHz...

I'm surprised that no one else has commented.

This was a mistake on your part. They probably thought it was a donation
to the club. They need 5x7.5 inch SASEs with your call in block letters
in the upper left hand corner. They also apreciate donations.

When I left the island a few

Some bureaus will take money, and furnish envelopes with your address on
them, but you have to check first.

Remember that you are dealing with a bunch of volunteers. The Willamette
club does not sell credits for envelopes.

> That all was three years ago. I have not received anymore cards, notes,

> they ever explain what their policy is or their rates?

I have used the 7 area bureau for years, and never had any problems. But
they handle the cards with SASEs (they HAVE to be 5 inch by 7 1/2 inch)
just like all the other bureaus. The ones that take money and do every
thing for you are the exception, rather than the rule.

According to The ARRL Operating Manual, only the 2nd, 5th, 6th, 9th,
0, Puerto Rico, KH6 and KL7 bureaus will "sell" envelopes and postage.
>
> Before thirty-seven of you refer me to back issues of QST, please no flames,

I thought about posting the list, but it is too long. Write to the
ARRL, 225 Main St, Newington, CT, 06111 and ask for their sheets on
both the incoming and outgoing bureaus.

Anyone
> willing to post how bureaus are supposed to work? (Not just post references
> to read that we don't have access to?)

I already posted a long article the other day on how it all works.

Good luck!

3548. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-06-16 03:44:51 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006160351.AA05853@ucsd.edu>
Source record: 10952

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As I expected, I got some strong replies to my bitch about the uuencoded program stuck in the middle of info-hams digests... everyone seems to think I can just hit N and skip to the next entry... MY problem is that I wasnt to read what comes AFTER the program in the SAME digest! We have no means to undigestify, in other words.

Why can't we create a separate list for binaries? I know that is fairly standard practice. As one person said, posting them directly is a good way to see that more people can get them. I agree. But not in the middle of a digest.

What do you say, INFO-HAMS admin?? How about a separate list for programs? I'm all for the idea. I agree that it's a great way to distribute the programs! I would gladly subscribe. We have ftp, but others do not and I want everyone to have a shot at the software.

3555. PRO-AM ANTENNA HELP NEEDED

Newsgroup: rec.ham-radio
Date: 1990-06-16 22:52:00 UTC
From: lwrclmr@SACEMNET.AF.MIL
Message-ID: <9006162302.AA18821@ucsd.edu>
Source record: 10961

I am need of information regarding PRO-AM mobile antennas.

I have two HF PRO-AM whip antennas, one for 40 and one for 75 meters.
When I got these whips, the instructions said to insert a capacitor in
the mount from the whip to ground for proper operation. I have since lost
the instructions and the capacitor somehow fell off the mounting and is
gone. I need the information as to what size capacitor this needs to be.

As I recall, I used the cap specified for the 80 meter antenna, even though
I frequently switched antennas as required. Without the cap I can't seem
to get the SWR down on the antennas.

Please E-mail me the information as to the required values if you have them.
I am leaving on a cross-country trip on the 25th and can't imagine going
without mobile HF.

Thanks for any help anyone can provide.

73,
Michael

From: brian@ucsd.Edu
Message-ID: <14415@ucsd.Edu>
Source record: 10962

I suspect that the person posting the program didn't know about the gateway to the mailing list or he wouldn't have posted it; those flaming you are demonstrating their ignorance.

I was out of town. If I'd been around to catch it, the program wouldn't have appeared in the mailing list digest.

But really, folks, the chances of any significant number of people wanting any specific program on this newsgroup/mailing list is probably quite small; it would much more courteous to let people know that it's available and mail it to those specifically requesting it.
- Brian (ayatolah of info-hams)

SB SAT @ AMSAT $ANS-167.01
FD OSCAR OPERATIONS, PART I

HR AMSAT NEWS SERVICE BULLETIN 167.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Field Day An Excellent Opportunity To Demonstrate Emergency OSCAR Operations

This year the annual ARRL sponsored Field Day (FD) event will take place on the weekend of June 23-24, starting Saturday at 18:00 UTC and ending Sunday at 21:00 UTC. FD is a simulated emergency preparedness exercise which challenges all of its participants to set up and operate an amateur radio station under "less-than-optimum conditions." This year OSCAR stations will find their way into many FD sites for good reasons. First, there is the pure excitement of making satellite QSOs at remote QTHs. Also, there are the satellite bonus points which can be earned for making just one satellite QSO. More importantly, with the current availability of packet radio store-and-forward message capability on FO-20 and the advent of BBS operations on AO-16, LO-19, UO-14, emergency traffic handling will soon be possible from anywhere in the world. Using the current flock of packet radio message satellites, there will be no place in the world which will not see several passes of these satellites per day. If a natural disaster should befall a certain geographical region, it will be possible for the PACSATs to provide additional capability to move "health-and-welfare" traffic in and out of the disaster area. With the current flock of PACSATs, small stations consisting of small, non-tracking antennas, small radios, and a laptop computer can make a simple PACSAT station in remote locations. Already, many PACSAT users are finding that a simple dual-band J-Pole antenna (see AMSAT Journal, March '90) will work quite well.
/EX
SB SAT @ AMSAT $ANS-167.02
FD OSCAR OPERATIONS, PART II

HR AMSAT NEWS SERVICE BULLETIN 167.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Field Day An Excellent Opportunity To Demonstrate Emergency OSCAR Operations

FD will provide an excellent opportunity to not only test a simple station for PACSAT operations, it will also challenge those who want to use the other OSCARs such as AO-10, AO-13, and RS-10/11. With AO-10/AO-13, reliable emergency communications will be possible for a large portion of the northern hemisphere for many hours each day. For those who do not think it is possible to operate an AO-10/AO-13 station during FD, see the account of

K8OCL in ASR #189. John describes the station that he and N8DUY set up for AO-13 during FD '89. Their simple station netted them 60 FD contacts and convinced them even more that it is possible to have fun with OSCARs on FD.

Still another reason to set up a FD OSCAR station is to expose and introduce other hams and non-hams to OSCAR operations. Many amateurs participating at an OSCAR equipped FD site will have an excellent opportunity to work PACSATs and OSCARs for the first time. Many non-hams who are invited to the FD site will not only have a chance to see HF operations, but will also experience what radio amateurs do with satellites. Today's non-hams are almost completely unaware that hams use their own satellites every day. Demonstrating an OSCAR FD station will certainly provide a surprise to both hams and non-hams alike.

AMSAT encourages all hams who will be participating in FD '90 to consider setting up an OSCAR FD station. Look for many new stations this year sending "CQ FD" on AO-10, AO-13, AO-16, FO-20, LO-19, RS-10/11, and UO-14. "GOOD LUCK and QRZ FD."

AMSAT SPACE SYM & ANNUAL MTG

HR AMSAT NEWS SERVICE BULLETIN 167.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Symposium to be held at Johnson Space Center

AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center Visitor's Center near Houston, Texas. The date for the weekend meeting will be October 19, 20 and 21 and it will be hosted by the Johnson Space Center Amateur Radio Club (W5RRR).

Registration will open on Friday afternoon, and tours of the Center will be made available not only on Friday but throughout the entire weekend. The tour includes areas such as Mission Control, the Shuttle Mock-up facility as well as the "Zero-G" Tank, a massive swimming pool used to train mission specialists for Shuttle EVAs (rubber rafts and water wings are not allowed).

The Symposium will take place on Saturday in the Visitor Center's Main Auditorium. It will feature talks on many aspects of amateur space communication and related subjects. There are sure to be a number of talks on Microsat operations. There will also be a talk on the results of the SAREX STS-35 Shuttle Mission as well as details of planned SAREX operations on STS-37.

The day will conclude with the now legendary "AMSAT attitude-adjustment hour", a Texas-style Bar-B-Que and the AMSAT annual meeting. Sunday's program will consist of a series of talks emphasizing how the average ham' can use the various amateur satellites - especially the newer Microsats.

Accommodations at a low-priced "convention rate" has been secured at the King's Inn adjacent to JSC. For more information on this year's symposium,

send an SASE to: AMSAT, 850 Sligo Ave., Silver Spring MD 20910 or call the AMSAT office at (301) 589-6062.

SB SAT @ AMSAT $ANS-167.04
CALL FOR PAPERS

HR AMSAT NEWS SERVICE BULLETIN 167.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

First Call For Papers For the AMSAT-NA Space Symposium For Oct. 10-12th

The AMSAT-NA Space Symposium and Annual Meeting will be held October 10, 11 and 12 at the Johnson Space Center (JSC) in Houston, Texas. Coming, as it does, during a year in which two Shuttle missions are scheduled to carry licensed amateurs, this should be an exciting site for the meeting. With the added attraction of the Center's extensive museum and fascinating tours available, attendance could easily break all records.

However, in order to have a successful meeting, quality papers must be presented. This announcement is to solicit appropriate papers. The AMSAT-NA Space Symposium, to be held in the JSC Visitors' Center Auditorium, is intended to feature talks on the latest in technology in both the manned and unmanned aspects of the Amateur Space Program. Talks on MICROSAT utilization are particularly invited. The session Sunday morning at the Ramada Kings Inn will feature presentations aimed at the beginning satellite users and those wishing to try their hand with the RS birds, AO-13 and the MICROSATs.

Those wanting to present papers are requested to send summaries to the AMSAT-NA office 850 Sligo Ave., Suite #600 Silver Spring, MD, 20910 by July 15, 1990. Those selected for presentation will be notified by August 1, 1990.

Final texts will be due in electronic form, either E-mail or floppy disc, by September 1, 1990. Reproducible figures and photographs will be due at the same time.

Let's make this the best AMSAT-MA meeting ever. Get your summaries in right away.

[A LATE BREAKING NEWS ITEM: According to Rich Ensign, at the Dallas HamCom 3 convention last week four more NASA Shuttle astronauts became Technicians and Ken Cameron upgraded to General class license. The AMSAT News Service (ANS) will get more details on names and calls soon but suffice it to say that both the Mission commander and the YL astronaut on board have now joined the ranks of amateur radio operators. STS-37 should be a real experience!

Congratulations to the crew of STS-37 for making it a foursome.]

SB SAT @ AMSAT $ANS-167.05
AO-13 ORBIT UNDER STUDY

HR AMSAT NEWS SERVICE BULLETIN 167.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Many attentive satellite operators have noticed that the AO-13 orbit perigee has been decreasing steadily since the final orbit change maneuver was completed in mid 1988. This effect is not one of orbital decay but is a symptom of deep space perturbations, most notably from the sun and moon, which cause the eccentricity of an elliptical orbit to increase and decrease over a long term cycle. If the perigee at some point in the cycle is low enough, AO-13 will begin to enter the earth's atmosphere, decay will begin to dominate, and eventually AO-13 may re-enter catastrophically and be lost.

Several amateurs, OE1VKW, N4HY, N6NKF, G3RUH, KA9Q, and WA5NOM among them, have undertaken to learn as much as possible about these effects and to attempt to numerically model the AO-13 orbit as far into the future as possible in order to determine, if possible, what will happen. While most of these models project a re-entry for AO-13 sometime within this decade, it must be emphasized at this point that all results thus far are thought to be incomplete and therefore inconclusive. Formal errors resulting from projections months or years into the future still leave open the question of whether or when AO-13 will in fact re-enter prematurely.

AMSAT has contacted various institutions, including Millstone Hill (the radar complex that provided early orbital data during AO-10 and AO-13 burns), NASA's Goddard Spaceflight Center, and other NASA Centers in order to have the most complete possible analysis of the problem performed by experienced professionals. Any decisions or plans on the part of AMSAT must wait until after these results are obtained and fully understood. Bob McGwier (N4HY) expects to report as fully as possible in the upcoming AMSAT-NA Journal and in a presentation at the AMSAT-UK meeting in July.

[This statement was provided for ANS by N5BF.]

SB SAT @ AMSAT $ANS-167.06
ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 167.06 FROM AMSAT HQ
SILVER SPRING, MD JUNE 16, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Schedule Announced
You have one more chance to test out your receive station on AO-13 during the latest round of The ZRO Memorial Technical Achievement Award Program. The "ZRO Test", which is a test of operating skill and equipment performance, has been running over the past few weeks and will continue through the end of June.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower their uplink power by 3 dB (half

power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine").

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures, means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB SAT @ AMSAT $ANS-160.08
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 160.08 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.4 and BLAT = -4.1 for 25 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination
to support Mode-B transponder operations, therefore, the transponder is
available for general use whenever AO-10 is in view at your location.
Please DO NOT use the transponder if the signals are FMing. The current
estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

RTTY DX Notes, 1of3, 6/15/90

RTTY DX Notes for Weekending 15th June 1990.
Part 1 of 3.
BID: $RTDX0615

Well, band conditions for the contest were not as good as one would
have wished, but we cannot always get what we have wished for. But
it could be said that they were fair, and from reports received it
would appear that there will be some good scores showing up. At least
we hope so. Now is the time for you to get to work and send your logs
to 55 Prince Charles Road, Frenches Forest, Sydney 2086. If you do
not know how to score, send them in anyway. We have a couple of good
calculators that know how to do that.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JG1NBD, N2HOS, OD5NG,
TG9VT and VK2EG. Thank you all for your efforts, and hope that you
all enjoyed the contest.

Thursday 14:
8P9AT 14087 at 0410Z QSL

QSL Information:

VK9LI will QSL via VK2SG as soon as the cards are printed.

IZ0MR/90 will QSL via I0IA.

UG7GWY asks for cards to be sent via Armenia Verevan Indeks 5, Padio Club, 375007 Armenia, Verevan, USSR.

KP6N/KP4 is via KP4USA.

8P9AT, Wolf Wagner, 12230 St James Road, Potomac, MD 20854, or via DL8KY.

Information Of Interest:

OM2BXW is a special call for OK land.

PP8BW is a special call for PY land.
And just to confuse you all, KJ is the stateside call, not Johnston Island, which is KH3.

ZD9BV has informed that the equipment that was sent to him has disappeared enroute. A search party has been dispatched, but so far they have not reported back that they have found the gear.

H44RW has informed that his RTTY gear will not work, so maybe we can forget the Solomon Islands for the moment.

ED9CI, Chafartnas Island should be active now by EA9JV. This will count for IOTA and prefix hunters awards, but unfortunately, not as a new country.

GL DE DX 1 (VK2SG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

3562. Making ham radio known

Newsgroup: rec.ham-radio
Date: 1990-06-17 22:25:00 UTC
From: RDW2030@TAMVENUS.BITNET
Message-ID: <9006172224.AA03527@ucsd.edu>
Source record: 10966

It's really funny just how many people have never heard of ham radio. They don't understand "ham" or "amateur" radio. I usually have to mention shortwave (such a misnomer!) and "talking to people all over the world" to ring a bell in most people's minds.

The question is... what good ideas can you guys come up with to really get people to know about ham radio and what it does for them as well as what a great hobby it could be for many.

This goes above and beyond the Radiogram service and the occasional passer-by that says "What's that radio for?" We hear this a lot at RDF hunts.

What unusual methods have you used yourself or seen other hams use to really get people interested in what was going on? We are in serious need of more grass-roots exposure, I think. If we can get some good ideas going, then we can possibly carry them out. I am a big ham radio evangelist, looking for more ways to let people know about it!

Mark Lowe - KB5III

73 and let's hear those ideas!

3563. Heathkit information needed

I need the instructions/schematics, etc. for the Heathkit HD-15 "Hybrid Phone Patch".

Also, I have a 2-meter power amp by Heathkit, but there's no ID number or model number on the unit. It uses two transistors, type 2N6084. If any one has information, schematics, etc. Please let me know.

73,
Dube Todd N5PDK

>Each Incoming QSL has its own rules, so what I am about do post is only
>guaranteed to represent 3rd call area policy. First, to get a copy of our
^^^^^^^^

Rules for 1st call area are similar, but not same. Money is accepted in lieu of envelopes, and we will buy envelopes on an as needed basis, if money is there to buy them (generally 10 cents an envelope or 25 cents for three, but this figure may differ from sorter to sorter). I ask that you do NOT put more than 25 cents on each envelope, but supply separate postage if you figure it may be more than 1 ounce. I do NOT hold onto cards for more cards to come in, although occasionally I will hold cards from one month to the next....for example, when I've already sent out one envelope and then find a few more cards missorted, rather than sending out another envelope, I'll just hold them for the next month. Please send envelopes NO SMALLER than 5 x 7"; they are difficult to find and tend to get lost... plus many QSL cards won't fit in smaller envelopes. As a courtesy, I will send out a postcard for hams who are in the callbook (HINT, is your name and address up to date in the callbook? If not, WHY NOT?), but have no envelopes on file, generally asking for $2.00 or $3.00 in postage/envelopes/cash, to open his account (and keep it going for awhile). This is NOT expected, and it DOES come out of my pocket, although we do request that the ham send 15 cents to cover the cost of the postcard, not all do (I guess they figure it's their right to receive a postcard). No response to requests for envelopes within 45 days results in cards being disposed and a big red "NO INTEREST DISPOSE" being placed on the ham's file card. When the last envelope, or low postage or money occurs, I send out an index card with the last batch, informing the ham of his status.

There are many cards that come in that are IMPOSSIBLE to determine who they go to. Foreign stations very often do not write clearly...I try to match up the cards as best I can using all available data. For example, if the QSL card has the receiver's first name on it, then I can start playing guessing names using the callbook: let's see, is it K1JTL, K1YTL, K1UTL, K1GTL, or K1TTL, Ah, K1JTL has the same first name, must be his, send it back to Call 1 bureau to be forwarded to the next sorter (this is only an example, but it gives you an idea of my thinking). If you get cards that don't belong to you, 'twould be nice if you returned them to the bureau next time you send in money or envelopes.....but not required...remember, that other ham may really NEED that QSL card, and sorters aren't perfect (at least I'm not :-).

To all Hams: DO YOU HAVE AN ENVELOPE ON FILE? IF NOT, WHY NOT?

CHEERS!
Diana

>in the upper left hand corner. They also apreciate donations.

This is NOT necessarily true. A few weeks ago, I received a $10 check for
one of my "customers". Since this ham was a friend of mine and I had told
him earlier that his account was just fine, I decided to call and tell him
don't send the QSL bureau anymore money. He replied, "gee, I had sent in
a DONATION, not money for my QSL cards." Anyway, money to the bureau is
not necessarily assumed to be donations. You must specify that it is, else
it would be assumed that it is for future QSL cards.

By the way, I do have a few large customers....20-30 dollars....but most
just send 2-3 envelopes and/or 2-3 dollars.

>> Has anyone else had experience with the Willamette Valley DX Club? Is this
>> standard practice? Is $20.00 the going fee for one-time pack of 30 cards? Do
>> they ever explain what their policy is or their rates?

$20 would go a long way with me.....And yes, if you ask for information, we
have a page of data that we send, if you send a SASE requesting it.

Message-ID: <1101@gandalf.littlei.UUCP>
Source record: 10885
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Well, the Blue Angels have finished their performance at the annual Rose Festival Airshow in Hillsboro, Oregon. Using the information provided in previous postings, I was able to capture a lot of interesting stuff on the scanner.

The preset frequencies in the planes included 251.6 MHz (preset 8) and 307.7 MHz (preset 16), both AM. The soloists were on 251.6 MHz while the four-ship formation was on 307.7 MHz. According to what I heard, 307.7 MHz applies to the west coast.

The team this year includes:

#1 Cmdr. Pat Moneymaker (flight leader = "Boss")
#2 Maj. Chase Moseley ("Ace")
#3 Lt. Cmdr. Dave Inman ("Moe")
#4 Lt. Cmdr. Doug McClain ("Mad Dog")
#5 Lt. Lee Grawn ("Bush") (?)
#6 Lt. Matt Seamon ("Spurt") (?)

Note that I'm not completely sure of the tactical callsigns, as they're used *VERY* briefly during transmissions. It got real interesting during the last practice sessions before the show when #6 lost an engine. Fortunately these are F-18's, not F-16's!

Oh yes, Team America was here too, using 123.475 MHz AM.

A couple of weeks ago someone was asking about accurate time keeping,etc
for an astronomical purpose. I just saw a half-card board for a pc that
contains a wwv receiver and interface for a PC/XT or PC/AT type computer.
It claims an accuracy of +- 20ms. It updates the system clock. It
operates on the 10MHz signal. Cost is $225.00. The company is:
Coordinated Time Link
Santa Clara, CA
408-980-1305
408-980-1468 (fax)
I know absolutely nothing about this company. The above is what I read
in a short magazine article.

Great idea Mark, I know the flow of programs here on rec.ham-radio is not that high but it would sure be a nice adder to have a place to exchange programs. I'll contribute "PATHFINDER" since I wrote the program and am still getting a reasonable flow of mail on it. I don't have the time but there is a prescribed format for kicking off a new discussion group which this is what we are probably talking about. Can some one pick up the ball and run with it?

Subj: Making ham radio known

Mark & all...

Your remarks reminded me of some cards a club back home had. It was about the size of a QSL, and had printing about like a weeding or graduation invitation might.

It essentially commented about amateur radio in general, something about the local club, and the ARRL (it was, after all, an affiliated club!).

We all had a couple hundred of these, and kept them in the glove compartment (now called a map compartment, and barely big enough to hold maps!) and when we encountered a person who asked, we all had descriptions and pitches we practiced, then gave them one of those cards.

Gee, that was back in the early 70's.

Now, unless you carry a video or can do it in 'rap' you might not hold anyone's attention too long. :-)

But maybe a handout brochure is *-not-* that bad an idea, with addresses of the local clubs, description paragraphs (with pictures?) of packet, oscar, atv, etc., and of course, the emergency preparedness and dx stuff.

As a minimum, I went to one of those quick print places and for $10 or so got some cards made up with my name and address and phone number. In the center where the copmany name might be is my call.

Some QSL printers were selling those years ago as "eyeball QSLs". But in addition to giving them to fellow hams at conventions, they can be useful to give to non-hams. It at least says to that person, if you want to find out more, give me a call... On one occasion, I had an individual call me using the number on the card. They weren't too interested at first, but thought about it and called later.

%MSG5107-W-SBMON, SOAPBOX MODE ON

I think a first step is to THINK about what would you say to someone if they asked you about ham radio? The way we represent ham radio will be what we think about ham radio, or maybe what we think ham radio should be.

But a good idea would be to know what you want to say and even practice it a few times. Grab a friend who doesn't care and practice on them. (You might have to buy them a pizza to get the opportunity!)

The point is, if someone asks you and you just shrug and mumble something about dx and morse code, that leaves a pretty fuzzy impression.

Think about what you do in ham radio. Do you yak with your friends on the way to work on the 2-meter repeater? Well, what do you talk about? Do you exchange cookie recipes and talk about what was on TV last night, or do you discuss the merits of antennas and propagation conditions the past week? I suspect you hear a little of both on some repeaters.

Do you go on transmitter hunts? Why? Do you work contests? Why? Realize my asking why is not a challenge to anyone personally. It is a challenge to the group at large to be ready to enthuse (is that a real verb?) others in what they do.

Ham radio's greatest resource isn't the hardware or the technology itself, it is the people that develop and use that hardware, that understand the need and the enjoyment of it. And even more so if they are ready to share that understanding and enjoyment with others.

%MSG5108-S-SBMOFF, SOAPBOX MODE OFF

Mark, good luck. I hope you can get a real movement going.

someone wanted this info posted, so...
from my files:
>From: stan@hprpcd.HP.COM (Stan Witherspoon)
Newsgroups: rec.ham-radio
Subject: Re: Yaesu FT-411 mods?

To allow the FT-411 to recieve from 130 MHz to 174MHz and to transmit
from 140 MHz to 151 MHz, turn off the radio and hold down both of the arrow
keys and turn on the radio. Be sure to write down all of the contents of
your memories first as this will erase them ! This is the MARS modification.
Repeating this procedure will turn the FT-411 back into a HAM only transciever.
Refer to the mods server for a more involved mod that will allow you to
set the transmit and recieve frequency limits at will within the capability
of the rf deck.

WARNING: Do not transmit over the air outside of the ham bands unless you have
the appropriate MARS license! For other frequencies, don't transmit at all
because the FT-411 is not a FCC-Type-Accepted radio for the public service
bands! Also make sure that your radio can't accidently transmit on a public
service repeater (in case you are all thumbs, or your radio gets stolen!)

Stan Witherspoon
RF: N6SCE

Note: I haven't tried any of this, proceed at your own risk. WA2ISE

more stuff:
Newsgroups: rec.ham-radio
Subject: FT-470 neat whizzy stuff
Keywords: mods, crossband repeater

Well, since there's a lot of mod' req's floating around, I thought I'd
mention something I discovered while attempting to perform a clone data
dump on the Yaesu FT-470.

The Yaesu Customer Service Rep' that I called today claimed that the
FT-470 *does* have a cloning capability despite the lack of instructions
in the manual. Supposedly, the way to get into Clone Mode is to turn on
the radio with the F/M key depressed.

HOWEVER! If you turn on the radio with the RPT key depressed, the radio
becomes a crossband repeater. Try it! Dial up two frequencies you want
to crosslink (be sure to pay attention to transmit offsets, if any), turn
the radio off, depress the RPT key, and turn it back on. The tone
encode/decode flags and the -+ flags will be flashing. When either
band's squelch opens, the other band is moved into the primary frequency
display and the transmitter keys. Note that the power output is

decreased to Low power. One note: the crossband audio isn't great, probably because it's whatever comes out the speaker and gets fed back into the mike. I suppose if you got serious, you could create a short interface cable to plug into the top of the radio.

73's & happy dual/crossbanding!

"cans" are probably usually 1/4 wave coaxial filters - typically used in
repeater duplexors. Since it's for a receiver you don't need the high
power capability and should consider helical resonators - much smaller
for one thing. I haven't any idea of a good reference for building
or designing them but you can get ready-mades from Digi-Key (Toko?)
tho' they're not real cheap. You might check out the recent ARRL
VHF/UHF book too.

Yeah, you have to go back to '58 to find a year like '89. There have been
a lot more of the really big flares (the ones that register so high that
they saturate the x-ray detectors on the satellites and the strength has to
be estimated...) this time around than in the past couple of cycles.

But there has been REAL good DX on 10 meters. Novices are making DXCC all
over the place. Stations in Germany have been taking standbys for mobiles
in rare U.S. counties and people have been coming back with 10 watts and a
trunk-mounted whip. And 50 MHz has become a real DX band, at least in the
fall and spring. I worked some rare stuff on 10 from a location I have
decided is a total RF sink (a dummy load without coax) until the pileups
got too intense.

Except for the spring of '89, which I rate a total washout here, it's been
fun hereabouts.

3586. Ham calls seen in horrible movie

Newsgroup: rec.ham-radio
Date: 1990-06-18 23:03:52 UTC
From: davet@tsdiag.ccur.com
Message-ID: <1014@tsdiag.ccur.com>

On the late, late, way-late movie the other night on NY channel 7 there was shown a movie starring Larry Hagman as a chivalrous helicopter pilot in Mexico. Early on in the film he was complaining to his partner that he could only talk to him via CB or Ham Radio. Interested by the mention of Ham Radio, I watched on (it was a _bad_ movie, but hey, I like _bad_ movies!). Sure enough, he started calling his buddy with real live Mexican calls (XE12L this is XE2YGH...the YGH stood for Yankee Go Home, which was his partnership's name as well, YGH aviation.) As the camera panned thru his shack, I noticed several QSL cards tacked to the shelf. I could make out for sure WD9ARK, and K5VNJ, and the others looked like WB8VCM and WD6NJY. Anyone know these Hams in person? The calls come back to:

Call-Sign: WB8VCM Class: ADVANCED
Real Name: BRUCE M SPACER Birthday: OCT 2, 1958
Mailing Address: 5829 TREE MOSS LN, NORTH RIDGEVILLE, OH 44039
Station Address: SAME AS MAILING ADDRESS
Valid From: MAR 10, 1987 To: MAR 10, 1997
Records Last Processed: MAR 10, 1987

Call-Sign: K5VNJ Class: EXTRA
Previously: SAME CALL Class: ADVANCED
Real Name: ALAN L BONNER Birthday: JAN 5, 1947
Mailing Address: 5754 LONGVIEW ST, PAPILLION, NE 68133
Station Address: SAME AS MAILING ADDRESS
Valid From: MAR 15, 1988 To: MAR 15, 1998
Records Last Processed: MAR 15, 1988

Call-Sign: WD9ARK Class: ADVANCED
Real Name: DALE A CARLSON Birthday: APR 13, 1946
Mailing Address: 1411 EUNICE AVE, JOLIET, IL 60433
Station Address: SAME AS MAILING ADDRESS
Valid From: APR 7, 1987 To: APR 7, 1997
Records Last Processed: APR 7, 1987

If you know these Hams, tell 'em they're celebrities since their cards are stars in a movie!

3587. Strange interference

Newsgroup: rec.ham-radio
Date: 1990-06-18 23:19:17 UTC
From: davet@tsdiag.ccur.com
Message-ID: <1015@tsdiag.ccur.com>
Source record: 10881

As an avid fan of 10m, I seem to be besieged by a most annoying bit of RF interference. It occurs in my apartment, but only in certain chunks of the band. It sounds kind of growly, and appears at approximately 210KHz intervals and lasts for about 140KHz. If it helps, here are the places I measured the noise one day:

28.040 - 28.195
28.250 - 28.390
28.460 - 28.600
28.675 - 28.810
28.885 - 29.020
29.095 - 29.230

This racket is very loud, most of the time S7 or so on my meter. The higher frequency edge is very well defined, accompanied by an increase in noise strength just before it drops to nil over the range of only a couple of KHz. Here's the kicker: If I apply RF to the antenna within the noise bands, even a few watts, the noise goes away for ~5-10 seconds, then slowly returns. I know it's not the AGC of the receiver - it's a TEN-TEC 580D and is capable of semi-QSK. (Read _reel_ fast recovery). Could it be a static buildup on the antenna that is shunted to ground by my finals when I transmit? Could it be a piece of hardware on a nearby phone pole oscillating? Could it be ... Satan? If any OM out there has had experience dealing with strange interference, I'd certainly be in your debt if you'd shed a little light on this strange beasty, so that I can enjoy what's left on this sunspot cycle in peace! Thank you in advance from the twisted mind of:

In article <9006172224.AA03527@ucsd.edu> RDW2030@TAMVENUS.BITNET writes:
>The question is... what good ideas can you guys come up with to really get
>people to know about ham radio and what it does for them as well as what a
>great hobby it could be for many.

Here are a couple of ideas I've implemented.

A few years ago our ARRL Section Manager here in the Santa Clara Valley
section started a speakers bureau. We found hams who were outgoing and
could speak enthusiastically and *with a minimum of technical jargon*
to service clubs (such as the Lions and Rotary) and other organizations.
(Don't forget your county and city supervisors.)

To support this effort, I came up with a slide show and script illustrating
the variety of ham activites in the area. I purposely only used photos
of hams in this section, so that it would be more personal instead of just
"hams somewhere are doing this." I did, however, show them hamming in
other locations, such as for DXpeditions and emergency communications.
I'd be happy to send the ASCII file of the script to anyone who wanted
to use it as a template.

When the SM became Division Director, he asked me to write up guidelines
for the speakers bureau, and he distributed them to other SMs and PIOs
(public information officers, now public information coordinators) in
the division. I don't think any of them ever implemented a speakers bureau,
and his successor as SM didn't keep ours going. As far as I know, the
slide shows are currently sitting on shelves somewhere. With only
minor modifications (we can replace the Coalinga earthquake pictures
with our own :-)), it would still be a fine show. Perhaps our incoming
SM (I know you're out there, Steve!) can resuscitate these ideas.

More recently, in my capacity as an Assistant Director for the Pacific
Division, I wrote up guidelines for hams who wished to write articles
about amateur radio for *non-ham* publications. There are lots of hnbby
and professional magazines out there that would be great for ham stories,
gang!! Rod publicized the guidelines in his newsletter, and I got about
a dozen requests for them. Excerpts also appeared in "Field Forum", a
newsletter from HQ for ARRL field appointees. I don't know whether anyone
has actually produced any articles based on my suggestions.

That should give everyone a few ideas to chew on!

>Your remarks reminded me of some cards a club back home had. It was about
>the size of a QSL, and had printing about like a weeding or graduation
>invitation might.
>
>It essentially commented about amateur radio in general, something about
>the local club, and the ARRL (it was, after all, an affiliated club!).
>
>But maybe a handout brochure is *-not-* that bad an idea, with addresses of
>the local clubs, description paragraphs (with pictures?) of packet, oscar,
>atv, etc., and of course, the emergency preparedness and dx stuff.

Ah, right, this reminds me of a couple other PR projects I've done.

One was a brochure for civic officials about ARES. Yes, stuff like that
is available from the League, but I figured it would be more effective
to show local examples of how we've helped in emergencies. I had it all
written and ready for the Section Emergency Coordinator to review. He
never did anything with it. Scratch that project.

Another was a flyer (actually, a series of flyers) for handing out
at Field Day and other public events. It's just on both sides of a regular
sheet of paper, and explains what we're doing and why. They came in
very handy the times we had groups up at a 9,000-foot elevation parking
lot running VHF contests and the California QSO party. The parking lot
is right on the way to a national monument, so quite a few people came by.

Again, I'd be happy to send ASCII files to anyone who wants them.

>This list didn't say anything about four-letter calls starting with N.
>Are these calls assigned to any service?

Four-letter calls as in:
1) N5KV? Those are ham calls, and, coincidentally, aircraft calls as well.
(US-registered aircraft are assigned calls that match their registration
number, and N#xx are legal airplane registrations.)
2) NAEF? I believe this block is assigned to ships of the US Navy.
3) N5KVXX? I don't believe four-letter suffixes are assigned anywhere.
4) NF5QX? Those are amateur calls, to be assigned when the KX5XX calls
are all gone.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 1 of 5

More bad news for the Shuttle

Space Shuttle flight STS-35 was postponed again just hours from launch on Tuesday, May 29. A reported hydrogen leak caused the launch to be scrubbed and no new launch date had been set at presstime. This flight is scheduled to carry astronaut Ron Parise, WA4SIR, and the robot packet "SAREX" (Shuttle Amateur Radio Experiment).

Techs Get Relief From Michigan "Scanner Law"

Technician class licensees now are included in an exemption to Michigan's "scanner law," thanks to the efforts of a number of state amateurs. Gov. James J. Blanchard on Wednesday, May 23, signed House Bill 4750, making the change official.

Although a law had been on Michigan's books for many years excluding "Conditional, General, Advanced, and Extra class" licensees, it apparently had never been prosecuted. The general feeling among hams was that they were excluded from laws pertaining to the monitoring of police radio frequencies, but in fact Technician class hams fell under the existing law.

Among the many hams who worked behind the scenes for passage of the bill were Don Spillman, WZ8O, an international representative for the United Auto Workers, and Dave Norris, N8HKV, a former police officer.

The signing ceremony was carried live via Amateur Radio, on 440 MHz to an in-car repeater parked outside the statehouse, then to a Lansing repeater and on to some 14 repeaters around the state.

Gov. Blanchard, upon seeing the bill before him, remarked, "When I was a young boy a friend's father had a ham station in his basement. I remember going there to 'tune in the world.'" Blanchard was carried live on the repeater hook-up.

Lobbying for an amendment to the law began in 1986, and in 1987 a bill identical to No. 4750 died in session.

On a related note, ARRL on May 16 filed additional comments with the FCC, citing its earlier petition and asking once again for federal exemption for Amateur Radio operations of all such restrictive local and state "scanner laws."

FIVE PARTICIPATE IN IARU SEMINAR

Another session of the US Telecommunications Training Institute concluded May 11, under the direction of IARU president Dick Baldwin, W1RU.

Participants in the course in Amateur Radio administration, held in Newington, included communications officials from Jamaica (6Y5EE), St. Vincent, Thailand (HS1KPR), Hong Kong, and Aruba.

Baldwin was assisted by IARU Region 2 president Al Shaio, HK3DEU, and by members of the Headquarters staff. In addition to the bookwork, the students participated in a 10 GHz demonstration using Gunnplexers, set a new class record for constructing code practice oscillators in the lab, and got a taste of PacketCluster.

PacketCluster, under the guidance of ARRL Technical Manager Chuck Hutchinson, K8CH, settled the traditional question of which student had traveled the farthest to attend the seminar. Connecting with a local node of the Yankee Clipper Contest Club's network, the "Show Heading" (and distance) command revealed that Mr. Aran Promata, from Thailand, nosed out Chak-lum Ng of Hong Kong for the "DX award"!

FCC EASES 902 MHZ RESTRICTIONS

Amateurs in Colorado and Wyoming have gained some privileges in the 902-928 MHz range thanks to an initiative by the Colorado Council of Amateur Radio Clubs and ARRL.

FCC, while noting that "various governmental agencies" still have fixed services in the 902 MHz band, polled those agencies and found that amateur operations in certain portions of the band would not be detrimental. Thus, effective July 2, 1990, FCC has waived Section 2.106 Footnote US267 and Section 97.303(g)(1) of its Rules to permit amateurs in the restricted area to transmit in the following segments: 902.0-902.4, 902.6-904.3, 904.7-925.3, 925.7-927.3, and 927.7-928.0 MHz.

The order stipulates that amateurs "must not cause harmful interference to, and will receive no protection from, any interference due to the operation of industrial, scientific and medical devices (ISM), automatic vehicle monitoring systems or Government stations authorized to operate in this band."

Government users of 902-928 MHz will, according to the FCC Order, eventually move to new fixed service bands, at which time the Commission will "consider removing the area restriction on amateur stations entirely."

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 2 of 5

"YOUNG HAM OF THE YEAR" NAMED

Mary F. Alestra, KB2IGG, 12, of Staten Island, NY, has been selected as the 1990 *Westlink Report* Young Ham of the Year, according to *Westlink*.

Mary, a seventh grade student at Rocco Laurie School, holds a Technician class license. She was selected from a field of candidates based on her work at IS-72 relating to the 10 meter "CQ All Schools Net" and dedication to recruiting new young hams through speeches, personal appearances, cable television appearances, and similar activities.

The award will be presented at the grand banquet of the ARRL National Convention in Kansas City, Mo., on June 9.

FORMER HAM ARRESTED

Richard A. Burton, formerly WB6JAC, was arrested May 17 for allegedly operating a radio transmitter without a license, following an investigation by Los Angeles area FCC engineers acting on complaints from amateurs. Burton was charged with three felony counts of violating sections 301 and 501 of the U.S. Code.

In the early 1980s Burton's license was revoked for various Part 97 violations. After his appeals were turned down he was ordered off the air but continued to operate using his rescinded WB6JAC call sign. On Jan. 15, 1984, U.S. District Court Judge Manuel Real sentenced Burton on four misdemeanor counts of operating a transmitter without a license. Following appeals Burton served seven months in jail and five years on probation.

On Monday, May 21, Burton pleaded not guilty on all counts, and was bound over for trial in early July. He could face up to six years in federal prison and substantial fines. (Thanks WA6ITF, N6AHU).

OTHER FCC ENFORCEMENT ACTIONS

* On April 26, the FCC seized four illegal CB linear amplifiers valued at over $1000 from R. H. Electronics of Magalia, Calif. The store is owned by Ray Hanson, W7KMM. The marketing, manufacture and use of illegal radio equipment violates Section 302(b) of the Communications Act of 1934, As amended, and carries potential criminal penalties. (FCC Public Notice, May 14, 1990.)

* Sue Swanson of Lago Vista, Texas has been fined $1000 for illegally operating on 27.970 MHz, a frequency allocated to the US Government for fixed and mobile operation. (FCC Public Notice, May 11, 1990.)

* On April 24, US Marshals, with assistance from the FCC's New York office, seized 27 pieces of radio equipment belonging to Dwayne Mayo of Jamaica, New York, after he did not respond to FCC directives to stop operating his CB equipment until television interference could be eliminated. The FCC's New York office told ARRL that "the seizure took place under Federal civil forfeiture provisions which were initiated by the US Attorney for the Eastern District of New York."

The FCC received letters from 30 area residents who complained that Mayo's illegal CB transmissions caused interference to their televisions and telephones. After several FCC letters to Mayo went unheeded, the FCC fined him $1600 for unauthorized CB operation. (FCC News Release, May 11, 1990.)

CAJUNS SUPPORT WARC FUND

The Acadiana Amateur Radio Association, of Lafayette, Louisiana, has donated $250 to the ARRL "WARC Fund" for the defense of amateur frequencies. The funds were derived from a club hamfest.

"The membership of this association," said club president Carolyn Oubre, KA5IJU, "acknowledges the importance of WARC and understands that if amateur radio is to continue to develop and grow, both technically and numerically, our frequencies must be defended. We also acknowledge the outstanding accomplishments of the 1979 WARC ARRL team. To duplicate that effort will require the support of every Amateur Radio operator in the US, together with other societies of the IARU."

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 3 of 5

BARBARA P. PRICE

Barbara P. Price, 55, died May 17 at Bulloch Memorial Hospital in Statesboro, Ga., after a long illness. She was the wife of Larry E. Price, President of the American Radio Relay League.

She was born in Waterbury, Conn., and lived in Statesboro the past 27 years. She was a member of Trinity Episcopal Church in Statesboro.

"Barbara was a frequent companion of President Price on his trips for ARRL and IARU," ARRL Executive Vice President Dave Sumner said, "and she supported him in the countless other ways that made it possible for Larry to devote so much of himself to Amateur Radio, while at the same time raising a fine family.

"We feel a great sense of personal loss," Sumner said.

Besides her husband, she leaves two daughters, Jane P. Brunner of Indianapolis and Carol P. Faircloth of Statesboro; a son, Steven R. Price of Savannah, Ga.; and two grandchildren.

The funeral and burial were May 19 in Statesboro.

Memorial contributions may be made to the Bulloch County Chapter of the American Cancer Society, PO Box 2027, Statesboro, GA 30458.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 4 of 5

ARRL INSURANCE PAYS OFF

At a sales meeting in early May, the Albert H. Wohlers & Co. insurers, carriers of the ARRL Ham Radio Equipment Insurance Program, released figures for claims paid relating to Hurricane Hugo and to the northern California earthquake, both of which took place in the autumn of 1989.

Holders of the League's plan were paid $48,104 for Hugo claims and $14,815 for earthquake damage. 13 Hugo claims were made, primarily from Puerto Rico and the US Virgin Islands; three earthquake claims were paid.

SECTION MANAGER ELECTION RESULTS

In elections just concluded, the following ARRL section managers were elected:

Alaska: Harley Steward, KL7IZZ;
Indiana: Peggy Coulter, W9JUJ;
Maine: Jeff Weinstein, K1JW;
Oregon: Randy Stimson, KZ7T;
Vermont: Mitch Stern, WB2JSJ;

Four races were uncontested and the following were declared elected:

Delaware: Bob Pegritz, KC3TI
llinois: Sharon Harlan, WB9SFT
Santa Clara Valley: Steve Wilson, KA6S
Wisconsin: Richard Regent, K9GDF

For details see "Happenings" in July *QST*.

SECTION MANAGER ELECTION NOTICE

July *QST* solicits nominations for section manager in the following ARRL sections: Eastern Massachusetts, Missouri, Nebraska, New York City-Long Island, South Carolina, Southern New Jersey and Western Pennsylvania sections. Incumbents are listed in every issue of *QST*, on page 8.

ARRL LETTER - Volume 9, Number 11 - June 1, 1990 - Part 5 of 5

ISRAEL SHORTENS "BANNED LIST"

On March 25, 1990, the Israel Ministry of Communications rescinded its prohibition on contacting neighboring countries with whom peace treaties

have not been conducted. Consequently, Israeli amateurs now may legally contact amateurs in Algeria, United Arab Emirates, Bahrain, Tunisia, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Sudan, Syria, Oman, Iraq, Saudi Arabia, Qatar, and both North and South Yemen.

Correction: Vol. 9, Number 9, referred to "CW subbands," which was inaccurate. The correct term is "non-voice subbands."

ARRL DX CONTEST PRELIMINARIES

The contest branch at Headquarters has released domestic high claimed scores for the ARRL International DX Contest, held last February and March, and while the Northeast continued its domination of single-operator scores on both modes, other areas of the country made serious inroads in other categories.

Exceptions to the single operator domination by stations in the first and second call areas include W9RE (second place CW, third on voice); N5RZ (number 10 CW); and NA8V and K0RF (both in the top ten on SSB).

On CW, WO0G, K4VX/0, and WN4KKN/5 all lead single band listings, while W0ZV and W7WA top single band 20 and 15, respectively, on SSB.

Official results are scheduled for October *QST*.

COMMISSION OFFICE MOVES

Effective May 17 the FCC Denver Office has moved to 165 S. Union Blvd., Suite 860, Lakewood, CO 80228 (303-969-6497/8).

QSL ETIQUETTE FOR SOVIET HAMS

In late 1988 a new world opened for Soviet Amateur Radio operators, when they received permission to send and receive QSL cards direct. In the February issue of their *Radio* magazine, G. Chilyants, UY5XE implores Soviet hams not to request International Reply Coupons from overseas (IRCs are neither sold nor negotiable in the USSR).

"...letters are beginning to come in," Chilyants writes, "to the [RadioSports Federation], the Central Radio Club, and to individual radio amateurs from foreign shortwavers, surprised by such behavior on the air by Soviet stations."

Chilyants offers the following advice on "how to make use of the right to give one's personal address over the air":

* "Give your address only when asked to do so by the other station, or after he has given you his;

* "Avoid giving your address when working DX stations and expeditions; your information won't be noted in the log anyhow;

* "It's not ethical to indicate the need for IRCs, much less the number of IRCs needed. These things will be determined by the other station. If there are no enclosures in the envelope sent to you, send your QSL via the

bureau;

* "If one IRC is enclosed, send your QSL by direct surface mail; if two IRCs are enclosed, send your QSL by direct air mail." (Translation from *Radio* by Dexter Anderson, W4KM).

Subj: Uniden for Education

The following is straight out of the July issue of 73, in the QRX area... Uniden America is offering a quantity of their HR-2510 transceivers to schools who have a licensed radio amateur on staff authorized to operate on 10 meters. The school must agree to install the equipment. When it is no longer in use, for whatever reason, the equipment must be returned for redistribution to another user. The radio cannot be sold or re-donated. The HR-2510 operates between 28.0 and 29.7, for information on how to apply for an HR 2510, contact Paul Davis at (817)858-3300. TNX Uniden

From article <12598864092.8.POPYACK@TOPS20.RADC.AF.MIL>, by POPYACK@TOPS20.RADC.AF.MIL:
> I have tried the field day program (FIELDAY.ZIP) by Paul Cassel, VE3SY.
> It works well until I run the program to print the results. It hangs up
> all the machines I have tried it on. I would love to use this program for
> field day, but it is useless if it cannot print the results!

And here I thought it was something I was doing wrong! I tried
to run fielday on a Philips P3105 (XT compatible) and noticed a
couple of undocumented features (hate to say "bugs"). It seems
that the running total of contacts always lists 1 contact on
each of the other bands, so the contact total is always wrong.

The other problem is when the contest is over and it's time to
print things out. I tried running sortfd from inside the fielday
program and tried running sort-fd from outside fielday. Either
way made no difference--the computer hangs and has to be rebooted.
Interestingly enough, I tried it again using different data and
got "divide overflow" when I tried to sort.

I'd love to see these features ironed out. The program runs considerably
faster than some other Field Day loggers I've seen (one of them also
called "fielday"). But, as was pointed out, if you can't print the
results it doesn't have a lot of usefulness.

And I was all set to ask for CW keying of the DTR lead on the COM1
port (a la K1EA and K8CC). :-)

Someone mentioned writing calls clearly on QSL cards to ensure that they reach the right person. I have been a manager in a small way for Usenet personality Trey WN4KKN, who was WN4KKN/KP2 for a day or two before and after operating KP2A multi-single in last year's WPX (which he won worldwide, yay...). Anyway, the cards that I have received for Trey, direct or via the bureau, now include *eighteen* different wrong versions of his call. And these represent just the cards that are correctly routed to me. A couple of cards went to AA5B who sent them on, some were made out "via AA4BT" but reached me through the bureau, and so on. Whereas many hams make up wall displays of their most exotic QSL cards, Trey is planning an exhibit of the cards with the wrong calls on them. I emphasize that it's not just 18 cards that had the wrong call, it's 18 different wrong calls among a much larger number of incorrect cards. OK, so it's quite a long call (and was only used on CW), but sheesh...

> As a courtesy, I will send out a postcard for hams who are in the callbook
> (HINT, is your name and address up to date in the callbook? If not, WHY NOT?)

Barring typos in the callbook (notify the callbook people) your call and address should be up to date both there and with the FCC. The callbook gets most of its info from the FCC which brings me to the point I want to note. I should like to remind ALL that the FCC requires us to keep them up to date with our current address. This is necessary, not only from an enforcement standpoint but to enable easier written communications. It use to be adaquate to mail a hand written letter informing them of a new address but not any more; now one is required to file on an FCC-610 form (a valid one). This is also to your advantage, as Diana kindly notes.

(Not ranting, just a friendly reminder from one who cares.)

The type of filtering you are looking for can probably be accomplished
using Helical Resonator Filters. See the ARRL Hand Book or the RSGB VHF handbook
for design criteria.

> I'd like to find some good books dealing with VHF/UHF design techniques...

The RSGB VHF Handbook may be what you are looking for. Also give the
Ham Radio Book Store (Greenville New Hampshire) a call and ask for their
catalogue. It is quite good.

This probably isn't worth a giant discussion, but there is a 2m weekly
net out on Long Island with the topic "Aviation" ... once, when I was
listening, someone pointed out that private pilots who were hams lucky
enough to have NA[0-9][other_stuff] callsigns could request the call as
their airplane license/registration ID, also (from the FAA).

Again, the letter X might come into play, because I seem to remember
X being reserved for experimental aircraft.

I am *NOT* a pilot and I am operating from memory here...just an interesting
note. Made me wish I had one of those calls ... and a pilots license ...
and an airplane ... and ... :-)

3607. Repeater Technical survey

Newsgroup: rec.ham-radio
Date: 1990-06-19 16:06:46 UTC
From: rbono@necis.UUCP
Message-ID: <1343@necis.UUCP>
Source record: 10913
Cross-posted to: rec.ham-radio,sci.electronics

I am looking to the net for some information concerning VHF/UHF repeaters.
I hope to gain some FACTUAL data, I am NOT looking for quotes from the data
sheets, so please consider this when replying.

A couple of us are responsible for four VHF/UHF Amateur NBFM repeaters in
our area. Two machines are on 2 meters, one on 1.25 and the other on 70cm.
With such a small sample (and each machine has different equipment), we want
to be sure that our systems are operating within a 'normal' performance range.

The main question concerns the use of band-pass/band-reject duplexers. If you
are using another type of duplexer, please describe:

Optional, manufacturer of the duplexer (with model number):

When operating into bp/br duplexers (when the output of such is connected
to a single feed-line/antenna system). Please answer (as you have experience)
the following questions separately for the 146/220/440 MHz bands
(600KHz, 1.6MHz, and 5MHz tx/rx offsets):

1) How much "measured" loss do you experience through your duplexer?

2) What is the VSWR (or reflected power) into your duplexer?

3) How much tx/rx isolation have you actually measured (i.e.: 100db?) ?

4) What is your duplexer configuration (i.e.: 3 rx and 3 tx cans) ?

5) Are you using a circulator or an isolator?

6) Are you using a "Z-match" device between your transmitter & duplexer?

7) How much output power are you running (power into the duplexers)?

8) Are the final output devices (last stage into the duplexer) tube(s) or
solid state?

9) Are you using a "Z-match" device between your transmitter & duplexer?

10) Have you experienced a need for using coax of higher quality than RG-214
between the TX/RX and the duplexers (and interconnecting the cans) with
respect to shielding/desense problems ?

Also, noting that we are an Amateur group (in other words, we don't have very much money to
spend), we would like to build "Z-match" devices for our
equipment (A.K.A. narrow-range transmatch). Does anyone have any design data,
schematics, or other information on these devices FOR USE IN A REPEATER SYSTEM?

We would love to use a circulator/isolator, but the cost of these devices are severely limiting (to us). Does anyone have any suggestions on these devices (construction, alternatives, etc.)?

If you are not directly responsible for a repeater, but know someone who is, please foward these questions to the person who can best answer the questions.

If you desired not to 'clutter' the net you mail email any response to me at "rbono@necis.nec.com" or, if you think the net would be interested in this technical "dribble", post it!! Packet: NM1D@WB1DSW.NH.USA

Thank you in advance,

Rich (NM1D)

From: cep@cci632.UUCP
Message-ID: <38176@cci632.UUCP>
Source record: 10914

I have noticed that most of the club calls listed in the callbook
state the name and address of the trustee (except for clubs which
have purchased special listings).

This year, I will conquer this by applying for a special listing
for K2GXT, but I wonder if it occurs to the publishers that our
club license reflects the CLUB'S address, not the trustee's,
and that this is a particularly annoying facet of club QSL'ing.

Ok Ok.....Geesh, I get the point....OUCH ;-)

Actually I have an idea VERY similar to this which had its' roots
in trying to improve the support to affiliated clubs in our section.

Each of the field organization heads, i.e. the OO Co-Ordinator, Section
Emergency Co-Ordinator, etc is required to come up with a 30-45 minute
presentation about their respective areas. The idea is that any club
can request one of these people to come down and speak at the club
meeting. This has the two fold effect of providing the clubs with
programs(which always seem hard to find) and getting the word out
about services provided by the ARRL field organization.

There is nothing that says these presentations can't be aimed at a
slightly more general audience like the Kawanas, etc. Or that we
can't collect/encourage other presentations and make them available.

Gee Patty....did I see a volunteer to co-ordinate all this ;-)

We do have other programs running in the section (which I'm
sure Patty is aware of) that are helping some to get the word
out about Ham Radio. Most of these are spear headed by our
PIC(Public Information Co-Ordinator) Randy, KK6BO.

The most recent addition to our efforts is the Childrens Discovery
Museum in San Jose. There is a permanent ham station at the Museum
which was donated by Kenwood. A club was formed around the Museum's
exhibit to staff the exhibit during Museum operating hours.
Randy has been actively involved in getting this club and exhibit
off the ground(there are several others who have put in a great
deal of effort also!)

The section has also purchased a large banner which is available
for any club holding a public event to advertise the hobby. This

is another item co-ordinated by Randy.

These exhibits turn up a lot of names of people who are interested
in finding out more about ham radio. Our latest effort is aimed
at channeling the names of interested people to local clubs who
are holding classes(another of Randy's ideas).

I know of at least 3 articles in local Newspapers about ham radio
in recent months(one of which was in the San Jose Mecury News) and
two spots on TV. So we have been getting some exposure in the
local news media but they came to us as oppossed to the other
way around. We still haven't figured out a way to guarantee
an editor is going to print our news releases ;-)

Point to all this is that we are working on the problem on
different fronts. (And all of this was under the current
SM, Glen WB6W. I wish I could take credit for it all but can't ;-)
What it really takes is finding some people who are interested
in the problem AND have the energy to try new things. We
got lucky and found Randy.

>More recently, in my capacity as an Assistant Director for the Pacific

I have had the misfortune to listen to 14.300 and 14.313
for the past few days, and wonder what *we* or the FCC can do to
stop this mess.

I am not sure of the absolute legality of the MM traffic
net, but I am certain that intentional jamming, obscenities,
transmitting of CW passaages from nursery rhymes etc is certainly
not permitted by the rules.

Two stations were most blantantly jamming. Both had Extra
class calls.

It's tough seeing a nice hobby "circle the drain". Is the
FCC considering any action against any of the participants in this
childish dispute? Is the FCC totally useless as far as taking
punative actions?

Since he says he needs a flat bandpass of 5Mhz (fast scan tv?), cans would
be too sharp. Coaxial cavity filters (cans) with any reasonable Q at all
will have a 3db point at about plus and minus 30khz. A better choice would
be a stagger tuned interdigital filter. A seven section filter could be
designed to have a plus or minus 2.5Mhz 3db passband. Trying to make it
phase linear could be tough though.

In case anyone's interested....

The USAF MARS Affiliates, Hawaii, will be QRV for Field Day from sunny Bellows Field Beach, Waimanalo, Oahu, Hawaii, working most modes/bands using the call KH6CTQ. Pete was pictured in the Handbook a couple of years back with his windmill he built especially for Field Day. It (and Pete :-)) will be doing yeoman duty again this year.

And now, a request....

I was intrigued with the possibility of actually making a satellite QSO this FD, thanks to the AMSAT bulletins that were posted yesterday. Now the question: Could some kind soul out in netland explain to a totally uninitiated user how to configure my equipment to make some satellite packet QSO's, as well as tell me where to find the birds?

Thanks in advance....and yes, I know it's kind of late, but isn't adaptability part of what FD is all about? :-)

Let me know PLEASE if you get an answer! I have the same problem and
have written him email on it. Also ftp'ed the file again just to make
100% sure that it didn't get damaged in transit... unlikely but I wanted
to make absolutely sure. Same thing.

I am considering calling on the phone... I have no other replacement for
the program and we now are counting on it.

Last ditch effort would be to take the data files after field day and
write a routine to comma delimit them, or in some other way make them
readable for DBASE or one of its many cousins.

What a bummer :-(

3617. Dubious quality of CQ review of AEA IsoLoop

Newsgroup: rec.ham-radio
Date: 1990-06-19 22:08:25 UTC
From: gary@midway.uchicago.edu
Message-ID: <1990Jun19.220825.2911@midway.uchicago.edu>
Source record: 10923

Just read the review of the AEA IsoLoop in the July CQ. Being interested in purchasing one the these antennas it was the first thing I read. . . but was pretty much disappointed with the "quality" of the review. The review seemed to me to be more of an advertisement for the IsoLoop than any kind of comparative critical analysis. Further, the "performance" characteristics of the IsoLoop were given as subjective judgements when in fact a quantitative comparison could have been used.

Here are some specifics...

A minor nit with AEA. . .

From the review it seems that to use the AEA IsoLoop you need "four-conductor control cable" that is not included in the package. It would seem that AEA could include such a trivial item without the buyer having to make another trip / phone-call / order to get this. What length to ship might be a problem. But, since the antenna is advertised to be "portable" (campsites, RVs, condos, etc) - some appropriate length consistent with these uses should be shipped.

X is better than Y - but whats Y ? . . .

The author compared the IsoLoop with his "old 20 meter" antenna and found a 2 to 4 S-unit difference between them on 14.105 - but he didn't say what kind of antenna he was comparing the IsoLoop to other than "old 20 meter". I think that when you say "X" is better than "Y" then you should tell us what "Y" is.

Propagation conditions or antenna - "It doesn't matter". . .

On transmit, the author seems to do a very unscientific comparison. Using the IsoLoop the author attempts a contact with a friend that he normally contacts through a node in southeast Arizona... he writes.. "There was a difference in the incoming signals that day, and the difference I was seeing Zip direct [not through the node]".

The author seems to confound the performance of the IsoLoop with propagation conditions. He didn't again try the contact with an antenna other than the IsoLoop. In fact, he writes this
"Was it the conditions, or was it the antenna. IT DIDN'T MATTER.
We were having fun batting it back and forth, discussing Hamcation
at Orlando." (Emphasis mine)

What kind of review is this - "It didn't matter" ?

Where's the hard numbers...

The author seems to make an uncontested virtue out of the very narrow/sharp bandpass. It seems to me that for receive and transmit one has to constantly adjust the antenna with the stepper motor. Depending how sharp this is, and how much deviation there is in S units across the tuning range and what kind of SWRs you can expect across the tuning range for different bands ... all this "tuning" could be a real bummer. The author never mentions any of this nor are there any hard numbers reported - like S unit ranges/comparison or any SWR performance data across bands.

So, I'm real disappointed with this review. Despite the review, I'm still interested in the IsoLoop and was wondering if anyone out there can do any better than this CQ "kid review" of the IsoLoop.

I'd like to know...

A S-unit comparison with a "known" other antenna. I just have a very simple 45ft dipole with traps. IsoLoop better than this ? What's the IsoLoop better than ?
Typical SWRs as a function of frequency. And maybe expected high/low SWR values across stepper motor tuning ranges within bands.
IsoLoop covers 14MHz-30MHz. Any possibility using this on outside this range (say 7Mhz) with an Antenna Tuner ?

The AEA IsoLoop is $319. I have a $100 dipole with 3 sets of traps. Is the IsoLoop better than what I already have ?

(I would of expected to derive the answer to this question from the CQ review - but I didn't. . .)

Thanks,
Gary

I agree with Ron Todd (no relation) that you should keep your address current.
I recently received one of my cards back from an address that had an irate note
to the postmaster that the individual had not lived at the address for YEARS, and
she kept receiving the cards and other mail. I got the address from the 1989
callbook. So the individual is either still alive, or I QSO's with a bandit
who is just using the guy's call.

>post more info ASAP.

Geez, you Americans get so HYPER ... :-)

What you're hearing about is IPARN - a group of people working on
building a voice (and digital, someday) repeater network that will
cover most of the populated areas of the country.

The first step was completed last week when repeaters in British
Columbia (VE7) were linked with a repeater network in southern
Alberta (VE6) via the Anik D3 (?) satellite and a series of UHF
point-to-point relays. Unfortunately, they were a bit optimistic
about the UHF link budgets. On one of the links an increase in
air temperature over the path introduces enough attenuation to make
the link unusable. When the temperature drops, the UHF link improves,
but the Ku band satellite link degrades. (I might have this backwards
but you get the idea). Right now the link only works within a fairly
narrow temperature range.

I was in Victoria/Vancouver last week and had a chance to try it
out. As per usual Murphy was traveling with me so nothing worked.
The Vancouver end of the link is on 147.06+. Give a call there
for more information. The Alberta contact is VE6AMC. You might catch
him on the Alberta Public Service Net at 1830MDT on 3770 (or there abouts)
weeknights. Or try the Trans Canada net Saturdays at 1800Z on 14140 (W's
dust off your keyers :-)

From: djf@nfinit.enet.dec.com
Message-ID: <1367@shodha.dec.com>
Source record: 10926

If the FCC is really doing anything, I doubt they would be talking about it publically. As participants in this hobby, there is nothing that we really have legal power to do, other than complain to the FCC, or to the operator who is misbehaving (assuming someone else is not using their call).

I do however agree that the garbage heard on the Nets and DXpeditions on all of our heavily used bands is getting way out of hand, and will probably cost us some of our precious frequency allocations in the future. I even avoid tuning across 20 or 80 with a prospective new ham in the shack listening because of the illegal activities that are quite often taking place.

We are supposed to be "self policing" in many of these matters. I however feel helpless when I hear this kind of stuff going on. As any on the air response to these activities is only an acknowlegement to their (the jammers, etc.) effectiveness in having disrupted the Net or DXpedition.

Anyone have any ideas, or know what is proper procedure in these kinds of matters?

[Stuff about the audio not being great]

You can fix this audio problem easily by building a Audio pass-through
cable. Very simply build a cable that connects the tip of the earphone
jack to the tip of the microphone jack. Like this:

-------- 100K ohms ---------
<----------------------/\/\/\/\/\/\/-------------------->
-------- ---------
mini-plug sub-mini plug

Connect only the tips. Do not connect the grounds. This results in
very good audio, the level of which is controlable by the volume
control.

This isn't about the review, but I noticed at least two errors in K2EEK's editorial, "Zero Bias". First, he used J. Craig Clark's old call, N1ACH, instead of his current call, NX1G. Second, they printed the word "peaked" when the really meant "piqued". I'm starting to miss _ham radio_ already!

3623. RE: Making ham radio known

Newsgroup: rec.ham-radio
Date: 1990-06-20 02:29:56 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <9006200239.AA12505@ti.com>
Source record: 10847

I go to a lot of movies. Several of the local theatres (particularly those franchised under Loew's and AMC) show slides between the features. As I sat there waiting for some film to begin, it occurred to me that we could do nicely to have one or two frames in that tray to show various aspects of hamateur radio. With a local club or contact address/phone number.

I called the National Cinema Network rep who informed me of the price. It was really high--more than *-I-* could afford, but maybe a club could manage it...? ((I mean a really BIG club!))

If these folks could be cajoled into running it as a Public Service Announcement (PSA) it might be cheaper.

The main thing the rep told me was how many people, statistically, see those frames. They're only on-screen for a few seconds (Kodak Carousel on 5-sec??) but they come back around. Two or three frames in each tray would almost guarantee that each audience would see one of them.

If the slides were well done... professional media whiz needed!... it just might be worthwhile if it gets some folks aware of (1) what amateur radio is, and (2) who to contact for more information.

Comments/suggestions, anyone?

Anyone who goes to a movie this weekend, notice if your theatre does the slides (usually local adverts, coming attractions, and the ones down here in the Dallas area all have Movie Trivia questions.) Also please, try to notice who runs it, whether it's N.C.N. or someone else.

Just a thought...

Oops!

I didn;t think about what I was saying...

OF COURSE, EVERYONE IS GOING OUT TO FIELD DAY THIS WEEKEND.

If you go to a movie *-NEXT-* weekend, please note what you find and
let me know, if you would, via e-mail...

AS AN AFTERTHOUGHT,

maybe if the NCN folk could be convinced this was to be a nation-wide
campaign, a "quantity" discount could be arranged for smaller clubs that
could not afford the normally exorbitant rates...

I doubt if the rates are too bad as advertising rates go, it's just a lot
of money for a rubber-band & paper-clip budget...

Cheers, all!

David Tiller talks of some mysterious and growly interference on 10M. If that is the only place you hear this, you are lucky!

I have them on all bands. They come in intervals just like yours! They seem to be about 20-30KHz wide and occur every 50-60KHz. They are EXTREMELY annoying, I agree. I just always assumed that they are from noisy power lines in the area, but have never really tried to verify this theory.

I was thrilled to see you mention this! As I read, I was amazed at how similar to my problem yours is and how well you described it.

Anyone got any ideas? I'm sure someone SOMEWHERE knows what it is! But like I said, I have a sneaky suspicion that it's power line noise.

Are there any members of the Amateur Auxiliary here? What ability does the (ahem) AA :-) have to help control this sort of crap that's going on on 20M and elsewhere? I would love to get in on such an activity. Just tuning around, I hear so much garbage and feel helpless to do anything about it, as many others have stated here.

How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm... precious little. It refers to an article in QST of Aug '84.

But hey, if we all write to our section managers (the guys that control the Auxiliary for their area) and find out about this, maybe we CAN do something!

I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately abusing the privilege, than screw it! Let the FCC know and hope that $1000 fine does the trick!

What do you all say? I have not heard of ANYONE being in the Aux., nor have I heard any mention of it in all my many years of hamming. (1.5, to be precise!) :-)

I really get steamed hearing it, though... and I'm ready to DO something about it, dammit!

>>his partnership's name as well, YGH aviation.) As the camera panned thru
>>his shack, I noticed several QSL cards tacked to the shelf. I could make
>>out for sure WD9ARK, and K5VNJ, and the others looked like WB8VCM and
>>WD6NJY. Anyone know these Hams in person? The calls come back to:

>>If you know these Hams, tell 'em they're celebrities since their cards
are stars in a movie!
--

WD6NJY might be WD6DJY - the Kenwood Employees' club. I heard them
on the air the other day, first thought "what a mouthful of a call",
then realized it rang a bell from those Kenwood ads I've seen in QST
and Other Fine Mags, I guess that says something about the power oif
advertising. They have that ad showing a typical ham station with
about a million $ worth of gear, and some QSL cards from faraway
places like Puerto Rico on the wall. Their card with this call is
featured somewhere in the ad, you could try and match it up with what
you saw if you can be bothered - anything rather than spending your
time watching bad xenophobic movies.

From: MROWEN@STLAWU.BITNET
Message-ID: <9006201126.AA19141@ucsd.edu>
Source record: 10832

A recent poster complained about the quality of the "review"
of the AEA Isopole antenna in the most recent CQ. He asked
whether this is a normal review for CQ ...

Well, it is. CQ has been notorious for years regarding its so-called
equipment reviews. They are almost never more than "gee, I liked
it and it fit in my Porsche." I would never, ever, make a buying
decision based on anything I read in CQ. The only reviews with
any credibility at all are those in QST. They have the lab equipment
to evaluate gear, the smarts to conduct the tests correctly, the
wisdom to refrain from testing stuff they can't evaluate properly, and
the cojones to point out shortcomings. They aren't perfect, but they're
a long shot better than the drivel that CQ passes off as "reviews."

There.

3632. The Saturday REAL EBS test

Newsgroup: rec.ham-radio
Date: 1990-06-20 13:12:00 UTC
From: SPADGETT@AUDUCVAX.BITNET
Message-ID: <9006201317.AA21484@ucsd.edu>
Source record: 10834

Several people have mentioned about the Saturday in 1971 the news wire services transmitted the EBS message that said an attack on the United States had been detected. I was working on the air at WMMB in Melbourne, Florida when that message rolled down the wire.

What I remember most about that day was immediately after the message that in effect announced the start of World War III, the AP followed with the Chicago hog prices. It was hard to take the message seriously when the wire is giving more coverage to hogs than the attack.

Every radio station was susposed to have a red envelope containing the "authenticator list" for EBS tests. The authenticator list was a series of words for each day of the month. The word in the envelope must match the authenticator word on the message before you can consider the message as real. The word for that day was HATEFULNESS. The EBS message had the correct authenticator word. I had to consider the message as real and read the "red card" EBS message over the air then took the station off the air. (We were not the primary EBS station.)

It took the AP 40 minutes to properly terminate the EBS message. During that time, I remember taking many phone calls from irate listeners and very upset station manager. The station manager cooled down when the FCC investigated and found that very few broadcast stations around the country actually did what they were susposed to during the alert.

While most hams don't possess the type of equipment to make detailed measurements on review antennas you are correct to indicate that there are a few parameters which every ham could benefit knowing before rushing out to buy one of these wallet smashers.

I guess this is how CQ can manage to run several reviews of the same item (they have done it in the past). All the more reason to join ARRL and read QST, this is the type of review they will have a ball with. Several years ago QST did a review on a broad band dipole; after running all the usual tests they even X-RAYed! the matching network and discovered several components in the potting that were not even connected!!! And they even FLAMED the product in the report. That is QUALITY in editorial policy, it's a shame that this is being diluted by the need to mantain a broad base of readership.

So we'll all have to wait for the QST review of the AEA IsoLoop.

Subject: ANS: Field day software bugs

Let me know PLEASE if you get an answer! I have the same problem and
have written him email on it. Also ftp'ed the file again just to make
100% sure that it didn't get damaged in transit... unlikely but I wanted
to make absolutely sure. Same thing.

I am considering calling on the phone... I have no other replacement for
the program and we now are counting on it.

Last ditch effort would be to take the data files after field day and
write a routine to comma delimit them, or in some other way make them
readable for DBASE or one of its many cousins.

What a bummer :-(

>
>Just read the review of the AEA IsoLoop in the July CQ. Being interested in
>review - but I didn't. . .)
>
Well, for a "review" of the Iso-Loop that isn't an advertisement, check
out the May issue of WorldRadio News. The antenna column, written
under the pseudonym "Kurt N. Sterba" contained some fairly critical
text. I threw that issue away, unfortunately, but that column in the July
issue is interesting. Seems that the publisher gave "Kurt" a phone
call, and demanded to know what was the deal (Apparently Mike Lamb of AEA had
given Armond a call) Anyway, "Kurt" isn't backing down, but they did give
Lamb space for a "rebuttal", where he says just about what Gary did in his
note. (i.e. no hard numbers, the advantages of narrow bandwidth, etc.)
In any even, AEA has sent "Kurt" an IsoLoop to play with, and he says
he will report his results in a month or two.

You know, I've never taken WorldRadio very seriously (I got a life
subscription to it when I was a teenager (thanks Dad!)), But the fact
that they even printed an article critical of one of their advertisers
bumps up my estimation of them a notch or two. Would even the ARRL, which
is a membership organization, not just a magazine, be this openly critical?
Probably not. Ham radio sorely needs a Consumer Reports type of organization,
to give impartial reviews, but alas, who would/could fund such a thing?

OK, OK, I'll get off my soapbox.

> Think about what you do in ham radio. Do you yak with your friends on
> the way to work on the 2-meter repeater?

Well I've only been Tech-licensed a week and a half, but one thing I do is help people make phone calls to friends from the top of 14000' mountains. If that doesn't stimulate interest, I dunno what will.

-- Last Sunday I had a chat with someone in Greeley from the top of Mount Lincoln, 14286', through the Horsetooth Mountain repeater, 95.5 miles distant, using 2.5 watts on a 2m handheld with a Hot Rod antenna.

Right after that I raised someone in Colorado Springs through line-of-sight (and what a pretty sight) to Pikes Peak, 68 miles away.

And within minutes I contacted N0UA air mobile on his way into Centennial Airport at 8500', on simplex.

> To allow the FT-411 to recieve from 130 MHz to 174MHz and to transmit
> from 140 MHz to 151 MHz...

Thanks but, as it came from the factory, it already receives on 130.0 - 174.0 (inclusive) and transmits on 140.0 - 150.0 (inclusive). (The latter surprised me, considering the ham band is 144.0-148.0, right?)

Is there anything interesting in 150.0 - 151.0?

And how do I access the mods server? (I know, "groan", there's that question again. Please bear with the new guy on the frequency.)

I may have seen your questions, but do not recall. If they were posed in a manner that would require a tome to answer, I probably skipped over them - I plead guilty. I all too often assume that dozens of others will bury you with answers - which apparently didn't happen in this case.

If you will pose the questions once again (directly to me if you do not wish to bore the net again), I will certainly attempt to answer them to the best of my ability. Understand though, that you will obtain opinion only - based upon 25 years of professional engineering/sales/marketing/consulting and 36 years of amateur radio experience - not necessarily expert nor in total agreement with what others will tell you. Just what I think. The net result is that the advice you get is worth exactly what you pay for it -- meaning you will still have to decide for yourself after I and others share with and probably confuse moreso than enlighten you.

Just in case you didn't indicate before, it would be helpful to know the intended use(s) (SW listening, two-way communications, fixed frequency monitoring, weather satellite monitoring, RTTY, Packet, AMTOR, etc.), frequency ranges and types of modulation (AM, FM, SSB, CW, etc.) desired, whether to be used in conjunction with a transmitter now or later, portability and/or power requirements, age of the operator(s), any physical disabilities (sight, hearing ,etc.) and other pertinent requirements.

Listening is a big part of ham radio. It starts with receiving. What is it you want hear? Best regards, Wayne, KB6CSP

Your bad attitude in unpardonable. 33 years is a long time for a stupid grudge.

I think his bad attitude is especially unpardonable because he's only 27.
He is falsely attempting to don the mantle of an old-timer, when in fact
he's just a premature old fart.

To make QSOs via the current pacsats requires more than just a TNC and radio. A 1200 baud PSK modem (kits are available from TAPR, AMSAT, and RadioKit, among others) must be constructed and interfaced with a TNC-2 or equivalent. Packcom has units already assembled that will also work. These take audio from an SSB receiver on 435 or 437 MHz pacsat frequencies and input data to the TNC. For uplinking, a 2 meter FM transmitter is used. Uplink data is "manchesterized" within the same PSK modem box, as a convenience. Satellites using this mode (known as "Mode JD, or FO-12 mode in deference to the first satellite utilizing it, the now defunct FO-12) are AO-16, LO-19 and FO-20. UO-14 uses 9600 baud packet and may also be available on FD.

If you are not already pacsat capable, getting ready in the two days remaining before set-up starts will be difficult. Of course, analog (SSB or CW) satellite contacts will be possible via RS-10/11 (which uses 2 meters up and 10 meters down) and/or AO-13 (which uses 435 MHz up and 2 meters down, among other modes). If you are interested in attempting contacts of any of these types, I can provide times of passes for your location and frequencies of operation. Of course, programs which provide the former and literature providing the latter are available from AMSAT-NA, POB 27, Washington, DC 20044; 301-589-6062.

We are planning a vacation to Denmark and the Netherlands this summer.

My wife and I are both licensed hams and we would like to bring our HT
and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)

We would like to use them to meet local hams, as well as for travel advice.

Are there repeaters on 2M and 440 MHz around those countries as there are here,
and will our current equipment be fine for accessing them, or do they have
different requirements for access, such as special tones, or different offsets?

Are the operating procedures on VHF/UHF repeaters similar to in the USA?

Can we obtain directories of repeaters, before we leave home.

What is the required procedure for reciprocal operating privileges?

Please reply via email, if possible.
Thank you very much.

3648. Re: making ham radio known (ARRL seems disinterested)

Newsgroup: rec.ham-radio
Date: 1990-06-21 13:55:14 UTC
From: albers@ka3ovk.uucp
Message-ID: <1990Jun21.135514.2691@ka3ovk.uucp>
Source record: 10853

Well, this message thread brings up sour memories of a meeting I was involved in planning back in March. Our club, MADRAS, invited Hugh Turnbull, W3ABC, and Kay Cragie, KC3LM, the ARRL Mid Atlantic Director/assitant Director, to speak before an open house at the Montgomery County Office building. The audience consisted of representatives of local ARRL member clubs, and we pretty well filled the cafeteria of the building. Anyhow, I was very impressed by Kay Cragie, who is the new kid on the block, and was very enthusistic about ham radio and had some very interesting ideas about expanding the hobby. However, I was very dissappointed in Hugh Turnbull, whom I voted for in the previous election. Several times during his time as the podium, questions were asked of him about what the ARRL was doing to advertize ham radio and as I worded it , "Put ham radio back on the kitchen table of America "(very patriotic, huh?). Anyhow, the answer was basically, the ARRL had no interest in doing that at all, and any elaboration was avoided by Hugh. It seems that the attitudes of the ARRL are largly one of a typical good-old-boys club, who don't want any of those new kids with unconventional ideas about the hobby get control of 'their' hobby. If this is typical of the attitudes of the ARRL, then I must agree with Wayne Greene of 73 magazine -- it's time for the ARRL to have some competition from another ham radio orgainization. Maybe than amateur radio has a chance to survive in the U.S. Unless the hobby can be made visible to the public, and be attractive to the public in todays society, it is doomed. Honestly, I don't know how to do it, but I do know it needs to be done, and soon.

Source record: 10854

In article <1990Jun19.220825.2911@midway.uchicago.edu>, gary@midway.uchicago.edu (gary buchholz) writes:
>
> Just read the review of the AEA IsoLoop in the July CQ. Being interested in
> purchasing one the these antennas it was the first thing I read. . . but
> was pretty much disappointed with the "quality" of the review. The review
> seemed to me to be more of an advertisement for the IsoLoop than any kind
> of comparative critical analysis. Further, the "performance" characteristics
> of the IsoLoop were given as subjective judgements when in fact a quantitative
> comparison could have been used.
>

I also read this artical, beacause that it was one of the first I have seen
on the IsoLoop. I ended up with many of the SAME questions that GARY did.

I also noticed several other errors in the magazine, the editorial which,
by the way, was the only mention of the "takeover" of Ham Radio by CQ Mag. also
it made a mistake in the call sign of one of its "new" employees from Ham Radio
Mag (Craig has not held N1ACH for a while now (he is now NX1G).
I don't always read the editorials..... I wonder how many devoted Ham Radio
subscribers will be surprized to find a "CQ" rag in their mailbox?!?!?

Back to the review.... This same author telephoned me to get the latest copy
of my DOSGATE packet application. He praised himself... kept telling of his
hundreds/thousands of dedicated readers.... Basically, he wanted to perform
a review of DOSGATE, and publish it in "his column".... Never having read his
column, I had him send me an S.A.S.E. for the DOSGATE disk, the same offer I
make to everyone else.....

A few months later.... I heard that the artical was published (this author
never contacted me again... and I was not even told of the publishing date or
target). I friend gave me his copy of the magazine with the artical (I think
it was April, '90)... The author used over 75% of text from my documentation.
There was very little 'review'.... I believe that a 'lay' person (one who is
NOT familliar with DOSGATE) would not be able to figure out what DOSGATE is
all about from this artical....

So I guess we should get use to these sorts of reviews... No wonder I hear
so many beginers saying things like: "I talked with Italy today on 10 meters
using a rubber ducky, 5 inch antenna. So it must be a good antenna". Or,
(when they are listening to the output of a repeater) "Yes, your new hand
held 1 watt radio is doing fine.... your signal here is 'full pin' on my
S-meter"....

I guess we can only try to 'educate' the beginers... explain how to
do some simple experiments, and to interpret the results.

Back to the IsoLoop (sorry for the rambling)... If anyone buys one of these things.... please let us know how it compares with a dipole cut for the band of interest, installed at a similar height, and make some contacts 'broadside' to the dipole, and switch back and forth between the two antennas while in contact with the same station.... Somehow I don't think that the IsoLoop will outperform any 'standard' antenna... It may be good as far as 'limited' space antennas go... If anyone has one, I would be glad to evaluate it for them!!

Needless to say.... I am NOT impressed with "CQ Mag".... I hope they will clean up their act.... I will probably let the rest of my subscription run its course.....

Geesh... my 'first' issue (since Ham Radio).... and I am already VERY UNHAPPY..... as 'Dire Straits' (sp?, the Rock Group) says:

I WANT MY H R M (HAM RADIO MAGAZINE)!

Cross-posted to: rec.scuba,rec.ham-radio

On pretty much a $0 budget, I need to come up with a method of having a diver communicate with a (slowly) moving boat from depths ranging from about 20 to 70 feet.

In brainstorming, someone mentioned the possibility of having a very low-powered transceiver, sealed for underwater use, and using the same frequency as our video depth-finder (200 KC). This should give an on-off capability, which obviously can be used for Morse.

Anyone ever heard of such? Are we all wet? (No pun intended). Any better ideas?

All suggestions, comments, etc., gladly received. Please e-mail, as I have doubts this would be of general interest.

...
does anyone have experience with ignition noise in nissan
hardbody pickups? i have a 1989 truck that seems to radiate lots
of ignition noise. i'm pretty sure that the dc from the battery
is clean -- i can unhook the antenna from the radio and the noise
is eliminated. transmit audio is clean with the engine running
-- receive is clean on very strong signals.

this occurs with a kenwood tm-201 and an icom 3210. the hood's
been "bonded" with braid. the noise is spike-type ignition
noise. i don't have a problem with alternator whine.

anyway, i'm looking for opinions before i start spending money on
suppressor-type gadgetry. thanks...

Hi,

I have gathered from reading this newsgroup that IRC's are
used to mail QSL cards internationally. I still don't know
exactly what they are and how they should be used when QSL'ing.
Where can you get them? Which countries should you use them
for? Do you always send one along with your QSL card if you
expect the receive a reply from a station outside the U.S.
So far I have only QSL'd and received QSL's from
foreign stations using regular postage stamps.

Thanks in advance for the answers to these questions,

Jon Neher
N6XUI

3655. Uniden hr2510/2600 conversion idea

Newsgroup: rec.ham-radio
Date: 1990-06-21 18:32:02 UTC
From: jpd@pc.usl.edu
Message-ID: <10410@rouge.usl.edu>
Source record: 10863

A local ham asked that I put this idea out for comment:

With the waning of the sunspot cycle the Uniden 2510 and 2600 radios
will probably drop in price; could they be converted to operate on lower
frequence bands, yielding an affordable multimode radio? 15m & 18m?
12m & 15m?

I believe the hr2510 (pre-epoxy) can cover a 4 MHz bandwidth, so maybe
15 & 18 meter coverage is not preposterous!

3656. Satellite Link Calculation Software Wanted

Newsgroup: rec.ham-radio
Date: 1990-06-21 18:58:16 UTC
From: garvey@cmic.UUCP
Message-ID: <348@cmic.UUCP>
Source record: 10857
Cross-posted to: comp.sources.wanted,rec.ham-radio,rec.radio.shortwave

I'm hoping someone in net-land can help me locate software that does satellite link calulations. The more variables that it includes the better I'll like it. Sources in C preferred. However, I'll try just about anything (once :-)). We have an HP 9000/370 running HPUX. However, if it is for an IBM PC, or Apple MacIntosh... it's still useful.

Please respond via e-mail. I'll summarize or e-mail depending on the number of "me toos" recieved.

3657. Experimental Callsigns

Newsgroup: rec.ham-radio
Date: 1990-06-21 19:47:17 UTC
From: daveh@compnect.UUCP
Message-ID: <644@compnect.UUCP>
Source record: 10858
Cross-posted to: rec.ham-radio,rec.radio.shortwave

In response to the earlier posts on US callsign assignments, I checked the FCC ham callsign database for "X" suffix calls and found the following:

AA0X-AL9X Ham calls AA0X-AL7X in database
AA0XA-AL9XZ Ham calls AA4XA-AA4XZ & AA6XI & AA6XX in database
AA0XAA-AL9XZZ No ham calls assigned in this block
K0XA-K9XZ Ham calls K0XA thru K9XZ in database
K1XAA-K9XZZ No ham calls assigned in this block
KA1X-KZ9X Ham calls KA1X-KZ9X in database
KA1XA-KZ9XZ Ham calls KA1XA-KM4XZ in database
KA1XAA-KZ9XZZ No ham calls assigned in this block
N0XA-N9XZ Ham calls N0XA-N9XZ in database
N0XAA-N9XZZ No ham calls assigned in this block
NA0X-NZ9X Ham calls NA0X-NZ9X in database
NA0XA-NZ9XZ Ham calls NP4XA-NP4XZ in database
NA0XAA-NZ9XZZ No ham calls assigned in this block
W0XA-W9XZ Ham calls W0XA-W9XZ in database
W0XAA-W9XZZ No ham calls assigned in this block
WA0X-WZ9X Ham calls WA0X-WZ9X in database
WA0XA-WZ9XZ No ham calls assigned in this block
WA0XAA-WZ9XZZ No ham calls assigned in this block

The above was extracted from a fall 1989 copy of the FCC ham callsign database. X suffix ham calls have been assigned in 1x2, 2x1 and 2x2 callsign blocks. I was unable to to find any ham 1x3 or 2x3 ham calls with an "X" suffix, so these do appear to be reserved for experimental licenses. There are also no W 2x2 X suffix calls assigned yet.

I would like to try recieving Omega navigation signals on 10-15KHz
(Not sure of specific frequency). Has anyone out there built a
TRF receiver for this band? I understand the Omega signals are
pretty strong. What kind of passband filtering and gain stages
would one use...seems like 5534 op-amps should work for the gain
stages. Perhaps LC bandpass for the TRF section?

Thanks in advance,

-Charlie Thompson

I recently received my IC-2SAT and tried the LIGHT+B+#+<ON> trick. The
dial now goes from 0 to something like 1309.9750. However, below 76.1 and
above 355.30 the display shows a "U" where the memory channel is displayed.
I assume this means some kind of error, and that the radio will only really
receive between 76.1 and 355.30. Is this correct? Before I bought the
set I looked at the spec sheet from ICOM. It claimed only 140 to 150 mhz
recieve. However, when I went shopping the sales guy said "Yeah, the specs
are usually bogus....here look for yourself...". From the factory, the 2SAT
will receive 134 to 174 mhz. Also, it appeared that there was no way to
quickly change the 100 and 10 mhz digit; e.g. to get from 140 to 150 mhz you

had to dial in "9990" (which gives you 149.990 mhz), the turn the vfo dial to get 150 mhz. With the LIGHT+B+#+<on> you can access the 100's and 10's digit. I don't know if this "mod" is such a good idea: I like to do band scan and now the band is huge. I suppose there is a way to program skip freqs though.

3661. Re: Making ham radio known

Newsgroup: rec.ham-radio
Date: 1990-06-22 04:23:29 UTC
From: julian@bongo.UUCP
Message-ID: <164@bongo.UUCP>
Source record: 10861

I am going to try not to waffle on this. It is an emotional subject. It even touches on Morris See-Dubblya.

We are faced with two items that trouble me: Ham radio is becoming an old man's game. Science is not catching the imagination of today's youth. This is not limited to the U.S., depending on whose survey you read, either the Limey's or the Yanks are getting stupider in the sciences. The only consensus seems to be that the Japanese are doing well in teaching their kids science.

I think that ham radio is applied science. Even to make a CW contact, you need to know some physics - less and less with plug 'n' play gear alas - and talking to the DX station teaches you some Geography. Hey, if you get to chat about the weather, you may learn some meteorology. Let's face it ham radio is more educational than bowling on Wednesday nights.

If we get anyone, even youth, interested in amateur radio, we are doing a small bit for the knowledge base of the world. If you learn about the piezo-electric effect, you are less likely to think that having the right crystal will give you more vivid dreams or clear up the dog's halitosis.

This forum is probably read by some of the best minds in the amateur ranks. These minds could help spread the word about amateur radio. What we should tell people is how great minds and great men enjoy amateur radio. Telling people that some overweight old farts in the local park in the last weekend in June is "Amateur Radio" is not going to fire any imaginations. Let's show them the wonder, the gee wiz stuff. We need to push the science and experimentation. Today you can work 100 countries in an afternoon with the AT&T endorsement - Your itemised phone bill is confirmation. So people are no longer amazed that you can tell someone in Africa that they are "Fahvnahncuessell?"

Tell 'em that you know how the stuff works, show 'em a globe, explain satellites, show them your computer receiving email from around the world via radio. Show them the wonder.

No doubt about it, amateur radio is one of the best applied science lessons you can give.

Now my beef is that the ARRL is not pushing the science angle to the public. The constituency of the ARRL is HF Contesting. Don't believe me? Read QST. Then see who the elected officers are, certainly in my neck of the woods, they are all DXCC (No AT&T endorsement) types. Remember what happened to the Microwave column in QST? What happened

to QEX? Then Ham Radio Mag just died. CQ Mag the home of "How I worked the contest from the Djibouti Hilton" type articles is doing fine. When the contesters finally die what are we going to do?

So we have a situation where maybe if we pushed science on the public - like teaching it in schools - we could have more radio amateurs. Then if we had more amateurs, maybe there would be more interest in Science. I have been told that in US schools Geography is no longer a subject. Fancy going for DXCC and not knowing where the countries really are.

I have taught amateur radio courses and I was floored at the ignorance of my students. I had everything from housewives to a high school math teacher, an insurance salesman and even a stocks fraudster who could h do things with money that only Ivan Boesky would appreciate. My best student was a Vietnamese woman who is now an extra. She understood the wonder.

Today I called the ARRL to see if they had any Public Service Announcement (PSA) Videos. A PSA is really a free ad that stations run as filler, they sometimes make it on the air early Sunday morning. I was told they had one with Ronnie Milsap. I will have it in a week or two and see what it is like. How about a video of a group of guys at consoles at JPL or somewhere saying that they started life wondering about ham radio and now they steer spacecraft across the heavens. How about an airline pilot on a flight deck saying that he learned about foreign countries, weather and radio communications as a ham and the wonder of it all made him want to do it for a living so now he's a pilot. We must all know people who have prestigious careers because they became interested in amateur radio. Can't that too often about bowling.

I know this is long and rambling, but it is much shorter than the original. Thanks for bearing with me, I feel much better now.

Let's interest people in the science of it all. If you just like to yak, you can bowl. If you like to be rude and obnoxious, rather than contesting, you could sell encyclopedias door to door. If we get people interested in the wonder of it all, maybe the general standards will improve. They could use it.

(extracting tongue)

actually, I'll agree that CW operators tend to be more civil, and it's about
the only mode I enjoy lately. However, communication is communication.
There is hostility on telephones, cb, the usenet, and all modes of amateur
radio. 20 meters probably just seems worse because it is such a hot band.
Everyone in the world can hear everyone else much of the time. That's a
lot of people trying to get along.

Interdigital filters can be built for this band and so can resonate
coils in a shielded containor (in 1988 Ham?/Antenna? Book). The
easiest is to use a set of tuned stubs or a version of the hairpin
filter. Look under microstrip or stripline filters for the lower
microwave bands. These can be cut and tuned with a knife/chissel
from regular copper clad epoxy.
But what can I say. I have built quite a few for 1.2GHz but all
have suffered from high 10-16db losses. If you get the notes
from the microwave conferences from the past few years you can
see what some people have played with (hair-pin) and get some
references but losses will be in the 2db range.

Yes, I will miss my "Ham Radio Magazine" and the outlet for part 3 of PATHFINDER. Given the realities of publishing we may need a little more time to see the fruits of the merger(?), Terry and Craig always quoted a minimum 4 month lead time which could be violated only on national emergency or the like. It seems that the July issue was pretty well buttoned up then the deal went down. Let's give them a couple more months to demonstrate wheither the presence of Terry, Craig and the others from HRM are going to make any difference. Another thing we could try doing is stop talking about technical content of "CQ" and flood them with the kind of manuscripts we would like to see. No, the day of the W2PV and K2BT type text book is probably gone but there are other outlets for this kind of work.

Is there any one out there who would like to suggest to Craig that he push for a quarterly technical publication under the present banner but of the quality that we have come to expect from "Ham Radio Magazine"? They could offer it at a discount to "CQ" subscribers and sell it full price on the news stands and via the bookstore.

If we are to recover our technical publications then we will have to work for them.

If the interference shows up on ALL bands, then see if your
receiver has a built-in loopstick antenna that's used for
the lower frequency bands. If so, you can use the fact
that there's a sharp decrease in signal strength with the
signal hits these antennas end-on. If the inteference
is fairly local, like a neighbor's television set, then
you can walk around the area, take bearings, and triangulate
to find the source of the interference.

No, you're thinking of "Lil Paddle", the other person who occasionally pens the Antenna column in WRN. I'm not exactly sure what the relationship is, if any, between the the two. They both claim to be uh, "Old Timers", though... As you can tell, that column is about the only one I usually read, more for its entertainment value than anything else.

BTW, Getting back to CQ. I was pleasantly surprised to read 2 antenna articles in the same July issue (first one for me) by Les McCoy, K1ICP, who has been missing from QST's pages for quite some time. It's interesting to note that he brings up the very same point about low efficiency of small antennas.

Here is a list of the wireless electronics books that I would
like to sell:

1. Modern Views of Electricity
Oliver Lodge

` 2. Talks About Radio
Oliver Lodge

3. Conqueror of Space
Biography of Lee De Forest

4. Man of High Fidelity, Edwin Armstrong
Biography

5. Loki, The Life of Steinmetz
Biography

6. From Immigrant to Inventor, Pupin
Biography

7. Radio Telephony,
Goldsmith, 1918

8. Elements of Electricity.
Millikan, 1919 $100

9. Experimental Electrical Engineering
Karapetoff, 1909, First Edition $100

10. Principales Underlying Radio Communications
U. S. Army Signal Corps, 1921

11. Hjemmets Radio, Norwegian, 1934

12. Standard Handbook for Electrical Engineeres
1915, 1983 pages

13. Radio for Everybody, 1922

14. ICS Handbook for Electrical Engineeres, 1908

15. Radio Laboratory Handbook, British

16. Hawkins Electrical Guide,
Ten Volumes, 1917

Is there a television set operating nearby? I get all kinds of RFI from my TV, and a bit from the neighbors'. The horizontal oscillator operates at 15.734 KHz. A high-voltage sawtooth makes a wonderful harmonics generator. The interference is modulated at 60 Hz by the picture brightness. On my SW receiver it sounds like a buzz that changes in loudness when the TV scene changes.

]
]Are there any members of the Amateur Auxiliary here? What ability does the
](ahem) AA :-) have to help control this sort of crap that's going on on 20M
]and elsewhere? I would love to get in on such an activity. Just tuning
]around, I hear so much garbage and feel helpless to do anything about it, as
]many others have stated here.
Yes, am a member of Amateur Auxiliary (OOC, AZ). There's not a damn
thing we can do about the problem on 20 meters. The AA basically
has three ways of dealing with these sorts of problems:
(1) Education - let an offender know that he/she is in violation of
either FCC rules or good amateur practice.
(2) Peer Pressure - let an offender know that he/she is not going to
get approval from other amateurs for his/her activities.
(3) Assist the FCC in gathering information necessary for
a prosecution.

When there are people who are very familiar with the rules and with
standard amateur practice, and who don't give a damn what other
people think, (1) and (2) don't work. We all know the problems with
#3.

]
]How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm...
]precious little. It refers to an article in QST of Aug '84.
]
]But hey, if we all write to our section managers (the guys that control the
]Auxiliary for their area) and find out about this, maybe we CAN do something!
]
]I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately
]abusing the privilege, than screw it! Let the FCC know and hope that $1000
]fine does the trick!

Don't go to the FCC. Do go to your SM and get involved in the AA program.
]
]What do you all say? I have not heard of ANYONE being in the Aux., nor have I
]heard any mention of it in all my many years of hamming. (1.5, to be
]precise!) :-)

It's not our job to make a lot of noise. It also varies greatly from
one ARRL section to another.

3678. Re: 440 MHz filtering

Newsgroup: rec.ham-radio
Date: 1990-06-22 21:21:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500574@ux1.cso.uiuc.edu>
Source record: 10780

What would be the bandpass curves of simple coaxial 1/4 wave shorting stubs attached to a T-connector? 1 of them? 2 of them spaced apart?

I am wanting to use some 1/4 shorting stubs for static dissipation and lightning protection, but would like to have some flexibility in the transmit range (we are talking <= 25w and typically <= 5w). I'd like to cover the whole 144-148 Mhz band if I can. Filtration is NOT my goal, but rather the ability to dissipate some static electricity. Resistors are out as they are destroyable components for surges. I also am planning to build this for 154-159 Mhz for some local public service radios in use.

I'd also like to know if anyone has tried this for dual-band use, and how good a bandpass can be had for both 144-148 and 440-450 (not exactly 3:1 ratio but close). I'm thinking to aim for the 147/441 Mhz harmonic pair as the center frequency. How high would my Q be on UHF as a 3/4 stub?

3679. Re: Icom R7000 sensitivity?

Newsgroup: rec.ham-radio
Date: 1990-06-22 21:47:55 UTC
From: chris@hplvli.HP.COM
Message-ID: <20200004@hplvli.HP.COM>
Source record: 10873

You indeed do have a problem with the R7000.
My R7000 met it's specs in all measured frequencies
up the limits of the HP-8640B signal generator.
Calibration of the S-meter was good (linearity and
accuracy) within my ability to read the meter.
SINAD sensitivity measurements were also fine,
per the ICOM spec, and good by comparison to any
"normal" ham receiver. I will try to remember to
post a copy of my measurements. It sounds like you have
a front end problem of major proportions, which
usually means it will be simple to find. Anything which
will cause 50 dB loss in sensitivity will be a broken
wire or relay, or a transistor really evaporated by ESD,
lightning, etc. Buy a service manual for the unit, it
has complex IF switching design, which changes with
receive frequency selection.

Then look for something obvious, like a module connector
having fallen out of it's socket, etc.
Just to be safe, see what you can measure in the way of
low-level sensitivity, ie NOT S-meter readings, but
what signal strength just starts to quiet the FM receiver
noise. Bad S-meter readings may indicate S meter AMP
problems, but bad low-level sensitivity means broken
RF or IF modules.

Take heart, a problem as large as this is usually simple
to fix.

Message-ID: <1990Jun22.221444.25178@ecn.purdue.edu>
Source record: 10778

>>From: k4bnc@cbnewsh.att.com (john.a.siegel)
>More seriously, QST edited out a portion of my letter to the editor on the
>3Y5 mess that implied that the ARRL DXCC program was due a share of the blame.
This should surprise no one. The ARRL has a quite notorious past
history of trying to surpress opposing points of view - but don't
just take my word for it, go look it up for yourself. Check
around - while you will find that the ARRL has done a lot of
good things for Amateur radio, some of the abuses of their
own membership is simply appalling.

>Does anyone else think that the DXCC endorsement/Honor Roll program contributes
>to the overly competitive, work em at any cost attitude that also leads to
>jamming? How about a DXCC for 100 countries and no further endorsements?
John, I've said it before and I'll say it again here. It isn't
just any one award that is responsible for this totally
disgusting behavior. It is an attitude which you summed up
quite nicely and accurately - "...work em at any cost..."

I have stated openly for some time that many hams simply write
a check for their QSO's. By that, I mean that they decide they
want to achieve a certain award or a certain "level" of
recognition and they go out and buy equipment that is sufficiently
powerful enough to do the job. Now if they were buying equipment
that fell within the "just powerful enough" concept, that
would be fine. But NOOOOOOOO, they have to go out and buy
the Kilowatt, the tower and the mega-antenna.

What happens? Simple! All it takes is for a few of these guys
to get into the same pileup for a station, and the poor
schmuck that everybody WANTS to QSO with can hear ONLY the
kilowatt hams! So what can the rest do - THEY go out and buy
the KW, assuming they can afford it, just to be heard. And
those of us who don't run that power level can never get through
to a DX station Because of all the kilowatters covering us up.

One time I had the satisfaction of turning this situation
around. I was sitting with my measly 20 watts on top of
a mountain in the Smokies and encountered a pileup with
a New Zealand ham - I put up my call at the appropriate
time and he responded immediately. He didn't believe that
I was running a Uniden 2510 with no amp and told me I was
not only 59+ but louder than some fellows who told him they
were running about 1 KW! Made me feel just *fine*.

Now that, of course, does not mean that I intend to move
into the mountains just to get a DX QSO now and then. I *do*

occasionally run into very considerate types who will
periodically ASK for QRP stations only. Compared to a KW
I do consider myself QRP. I wish more stations both
stateside and DX would do this and give the little guys
a chance.

This ties in perfectly with what you are saying - there is
a real bad attitude in Amateur radio (and NO, it isn't
everyone....) that says make the QSO no matter what you have to
do because by God! I paid for that piece of spectrum and
by God! I own it!!!!! This attitude is pure crapola and
is, IMHO, the source of a great deal of the malicious
QRM that is going on.

I think the majority of hams aren't guilty of the worst
offenses but by their silence they contribute to the problem.
If enough of us screamed bloody murder to the FCC about
some of the more obnoxious cases, you bet something would be
done about it. But not enough of us do scream, so the
FCC figures it isn't a big enough problem for them to
waste manpower on.

For a supposedly self-policing service we are doing a pretty
lousy job of it.

>
>Al N1AL

This may sound like a subtle dig to the the no-code folks but it may become a viable solution in the not so distant future. If the Amateur Radio Service continues to deteriorate in quality and the number of illegal operators continues to expand at their current rates, the HF spectrum will become enough of a problem to the other services that the politicos will have to act. To head off the total banning of Amateur Radio, the ARRL, FCC etc. might offer to ban the voice mode where the problem exists and give up the voice spectrum without a fight. In other words, bribe the power brokers to leave us with at least a minimal amount of spectrum and the CW/digital modes. This would make enforcement of a ban on illegal radio transmissions easier as any voice transmission would be illegal. Further, the small amount of relatively unobtrusive CW/digital the air would cause few problems and would bring little attention to itself.
I have a feeling that, under this scenario, there would be good deal of technological advancement in CW and the digital modes and at least the technical and educational basis for Amateur Radio would survive. One of the arguments for no-code is that CW is outmoded. Well, in the digital age SSB is outmoded or will be soon as new hardware based DSP technology comes on line. So melt down your D-104s OM's. The days of shouting into a mike at your good buddies across town are coming to an end.

See you on the narrow bandwidth, high throughput modes OM's. Its happening now.

I'd say leave them alone, get convertors and transverters, and get on
UHF and higher.

3685. The Demise of HR Magazine and Comments on CQ

Newsgroup: rec.ham-radio
Date: 1990-06-23 03:15:36 UTC
From: ornitz@kodak.UUCP
Message-ID: <2480@kodak.UUCP>
Source record: 10787

Like many others who have commented lately about the dubious quality of CQ magazine, I feel a great loss at the demise of Ham Radio Magazine. When I read that HR had been sold to CQ in last month's HR, I first felt a great loss which turned to anger when I realized that I had just sent in a three year renewal. The thought that any of my hard-earned (or even not so hard-earned) money would go to a subscription to CQ riled me. The numerous times I have read CQ have convinced me that the magazine is tailored for contesters and appliance operators. While I have no complaint with people who get their kicks out of contesting, it is not for me (except maybe Field Day). The technical content of CQ is about the worst of any ham radio publication I have ever seen. It is certainly not for my tastes!

I decided to call the subscription office of Ham Radio and see if my renewal could be cancelled. I spoke with a very nice lady whose name I do not remember. She said that I could certainly cancel my subscription and get a refund. When I told her my subscription number, she remarked that I had been reading Ham Radio for a long time - since early 1971. I said yes, and that I was sorry to see it go - especially to CQ. She remarked that I was not alone and that a very large number of other hams were doing as I had done: cancelling their subscription immediately and asking for a refund. It was rather sad talking to this lady, who obviously was not happy with the events either. She said the decision was purely a financial one on the part of their owner, even though a number of the staff felt that CQ was the wrong magazine to sell to. Ham Radio realized that their audience was a specialized one leaning heavily toward technical topics and that CQ was just the opposite.

Well, I received a CQ magazine the other day and the mailing label indicated that I had three years and a few months of subscription left. Perhaps they have not had time to cancel it yet, or perhaps my cancellation got lost in the shuffle. In any event, I will call them in a few days to see what happened. I certainly expect that all of my renewal fee should be refunded.

In any event, if enough former Ham Radio subscribers cancel what is left of their subscription to CQ, it should deliver a quite powerful message: the amateur radio community still supports a technically oriented magazine and that CQ is inadequate. Perhaps CQ will come around and greatly improve their technical content. If they make enough of an improvement, I'll subscribe. In the mean time, I renewed my membership in the Applied Computational Electro-magnetics Society, and I am looking into some of the European amateur radio journals. Perhaps others on the net can make suggestions about some of the smaller technical newsletters on VHF/UHF/microwaves. I am open to all suggestions. For those of you who are eligible for a free subscription, RF Design is an EXCELLENT magazine.

BTW, when I sent in my renewal to Ham Radio in April, I asked for an author's guide so I could submit an article. As far as submitting it to CQ, no thanks! Unfortunately it is a fact of life that when an advanced construction article is published in a magazine like CQ, a large number of people may attempt the project who really have no business doing so. The poor author gets stuck with a number of irate letters and lots of dumb questions. Well, technical questions are good and I enjoy answering them - but I don't have the time for such things as: "I substituted a Radio Shack 2N2222 for the GaAs FET and I used masking tape instead of PTFE. I used 1 microfarad mylars from my old speaker crossovers instead of the tantalum electrolytics. Why doesn't it work like you said on page 23? I know I followed your article exactly, and I have lots of experience. Why I built that 10 minute ID timer last year from the pre-etched circuit board with all the parts from my local Radio Shack!" And he doesn't even send a SASE....

I do not mean to sound elitist, but unless the technical competance of the average reader is at least somewhat near that of the audience the author intended, the highly technical article is a waste. Don't get me wrong, though. I am very much in favor of improving the technical know-how of hams. It is just that I would have to write on a far less technical level if I were trying to tailor an article for the average CQ reader. Someone has suggested that the way to improve CQ is to flood them with good technical articles. Perhaps. I hope so. But I doubt if CQ will risk losing its far larger circulation of DXers and contesters by running many highly technical articles in place of contest announcements and product "reviews" of faithful advertizers.

And before the DXers and contesters complain, let me again say that you deserve your own specialized magazine. These activities are just not for me, and I don't want to pay for a magazine that does not fit my interests.

Well, tomorrow is Field Day and I have to get the rigs ready for the mountain top! The motorcycle battery is charging and Murphy is warming up! 73

Sb: Icom O2 and O4 Audio Fix

===== AUDIO MODIFICATION FOR ICOM IC02 AND IC04 RADIOS =====

This audio mod works on the 02 and 04AT. It increases the
level of audio, as well as rolling off some of the lows.
Sounds real nice. It involves the circuit around Q105.

1. Replace C119 with a .01 uF cap (disc ceramic is fine).

2. Parallel R131 with a 1 uF cap (use a tantalum cap).

3. Parallel R132 with a .01 uF cap (disc ceramic is fine).

This is not the same mod as the one International Radio is
advertising, which involves changing C117.

I tried an AB-1 Audio Blaster from Engineering Consulting,
and was very unhappy with the results. I am very pleased
with the audio given by this mod (much cheaper too!).

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

> neck of the woods, they are all DXCC (No AT&T endorsement) types.

Maybe that's because the experimenter/scientist types consider themselves above mere "politics." Hey, the voters can't vote for a person who isn't a candidate. As long as the technical types stay out of the political arena, they will be poorly represented. This is as true of the ARRL Board of Directors as it is of any other political body.

> Remember what happened to the Microwave column in QST? What happened
> to QEX? Then Ham Radio Mag just died. CQ Mag the home of "How I
> worked the contest from the Djibouti Hilton" type articles is doing
> fine. When the contesters finally die what are we going to do?

Ummm... what specifically are you referring to with QEX? I can tell you that the biggest problem with QEX is that people don't submit good material for it. On numerous occasions, the editors have suggested that a piece submitted for QST go into QEX, only to have the author leave in a snit. The reality is that the technical level of QST is going to approach (hopefully from above) the technical level of the _average_ ham, not the techie. (That's one reason why Ham Radio was successful for so many years--little competition in its niche market.) If people want to get highly technical information published by ARRL, QEX and the conference proceedings are the only available forums. (BTW, the technical editors probably wouldn't agree with that statement, but I think they would agree that a "simple but engaging" project has a better chance of appearing in QST than a highly technical one.)

> Today I called the ARRL to see if they had any Public Service

> bowling.

A wonderful idea. It's worth suggesting directly to the folks in the Educational Activities Department at HQ. Write to Rosalie White. (They are getting some spots done by the ham astronauts, but I don't know the content.)

Understand, though, that resources--especially time--are hard to come by at ARRL HQ. The EAD has three people in it. Two of them work full time getting requested material out to the preople/clubs requesting it; the other one (Rosalie) has to do everything else, which includes planning the Educational conference, coordinating the SAREX missions, coordinating the generation and publication of lesson plans, etc. So don't expect that they can initiate a large-scale program and carry it through. What works best is when volunteers do more than just come up with good ideas. If you can locate someone capable of producing the spots, locate the people to appear in them, get scripts written, shoot the spots, title them, and deliver them to ARRL HQ, maybe they'll get distributed, but it would be better to locate someone to take care of distribution too. It's not that we don't care, it's that we don't have the time and the money to do all of the good things that you (and we) would like us to do. I don't remember the exact numbers, but in the last ten years the number of staff has stayed nearly constant while the membership has increased by something like 40%. (That's probably not the right number, but the point is the number has increased a lot.) So things are operating about full-out at HQ.

> Let's interest people in the science of it all. If you just like to
> yak, you can bowl. If you like to be rude and obnoxious, rather than
> contesting, you could sell encyclopedias door to door. If we get

Part of the problem we have now is the "I'm OK, you're not" attitude reflected by comments like those. Ham radio has a lot of facets, and bickering between the proponents of one thing or the other is not helpful to anyone.

It's as good as the material submitted to it--no better.

I see a lot of people p*ssing and moaning about the lack of technical material. I _don't_ see those people writing and submitting articles.

How about it, folks?

Unfortunately, I never really knew about Ham Radio magazine. I have some old issues (early late 70's, early 80's) but just assumed they weren't around anymore. Maybe it's a good thing, because I'm not in mourning over it. I am sad to see a quality publication go, though. I am an experimenter, too, just starting in RF projects.

**** UoSAT-OSCAR-11 BULLETIN - 217 08 June 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 **

A new version of the PCE Housekeeping Integration Task (HIT) has been uploaded
to the spycecraft. In addition to providing telemetry and file broadcast, this
version also incorporates digipeating. The digipeat callsign is UOSAT3
(SSID 0). All binary data (e.g. telemetry & broadcast packets) will now be
sent from UOSAT3-11 to allow filtering with the LCALLS command.

** CPE DETECTS SOLAR FLARE **

The Cosmic Particle Experiment (CPE) on UO-14 has been monitoring the LEO
radiation environment since late April. On Mondqy 21st May, at just before
Midnight, the CPE picked up enhanced activity at high latitudes, in which the
particle count rate grew by two orders magnitude, peaking after about 8 hours -
indicating that a solar flare had occurred. There was then a slow decay until
about 22:00 hours on Thursday 24th, when there was a very sudden increase in
auroral region activity - again about two orders of magnitude. This activity
decreased rather more slowly, with further enhancements occurring on the
evening of the 26th May and the morning of the 28th. Since then, the activity
has decreased, reaching its 'normal' level by 1st June. Data from this experi-
ment are collected and analysed at UoSAT Mission Control before being passed on
to RAE Farnborough.
```

** 5th AMSAT-UK/UoSAT Colloquium **

The 5th AMSAT-UK/UoSAT Colloquium is taking place at the University of Surrey, England from July 26th - 29th 1990. As usual, there will be a varied programme of lectures for both the beginner and the experienced operator. Booking forms must be returned by 1st July 1990. Further details are available from Ron Broadbent, G3AAJ at AMSAT-UK.

** AO-13 **

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 179 and BLAT = -2.1 for 04 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

** AO-10 **

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

** BID **

Please use BID $UOSAT.217 when copying to the packet network.

]
Yeah... me too. I think I'll wait a couple of months to see if they
start running interesting stuff before I cancel my subscription.

]I wonder if QEX from the ARRL is any good as an experimentation magazine?
QEX is a fine magazine. Unfortunately it is quite small... only a couple
of articles (plus some columns) per issue. One nice thing about QEX
is occasionally they have articles that are essentially calls for discussion
on various issues. If you don't get QEX, I recommend it.

>Maybe that's because the experimenter/scientist types consider themselves
>above mere "politics."

Actually, that statement reflects that
1) the speaker isn't an experimenter/scientist type
2) he doesn't understand the experimenter/scientist type
3) he considers himself a politician
4) he thinks that e/s types think they're superior
5) political types think they're superior
6) he like you to think the same
a lot of baggage to pack into one sentence. But let me provide an
alternative view:

I've been in ham radio politics - I'm not well suited for it. It's not
very different [from my perspective] from ordinary politics - you'd
expect that. But it's very different from the world that the
experimenter/scientist works in every day.

To an experimenter (or even more so, a scientist), the world is a
rational place, where there are rules which strictly determine the
effect from the causes. Often these are simple rules, linear,
predictable, comfortable. Sometimes they are complex, as are the
non-linearities of the chaoticists.

But it is a comfortable rational world, where all you have to do to
make it work for you is learn the rules and extrapolate them to cover
your situation or experiment. Never do rules work against their own
nature, or out of spite, or for hidden reasons or to further covert
agenda. And the scientist likes this comfortable rational world, where
all pull together to further the one cause of knowing and doing more.
In science, those who don't reason scientifically don't last long.

The political world isn't like that. Oh, it has its rules, but they
are not linear, nor predictively chaotic. They are, in the main, based
on estimating the worst possible motives of all concerned and the
irrationalities of the common man, coupled with the need to attain and
maintain power and control. In a sort of Darwinism, the political
world breeds that type of person - those who cannot control do not last.

This is regrettably necessary, as people will not be governed by rational men, for the people themselves are not rational. They will not stand for strict rational control. Indeed, out of the desire for rational control grew some of the worst dictatorships of history, better only than those governed by madmen.

So the scientist (or experimenter) is not well suited to politics.

So don't ask the scientist to play politics, and don't ask the politicians to play science.

Their minds are of different bents and do not easily change.

Instead, they have to work together to determine what is best balanced agains what is really achievable.

There must be some way to help this happen in the ARRL and the rest of amateur radio. I don't think we've been very successful so far.

- Brian

3695. Re: The Saturday REAL EBS test

>
>Several people have mentioned about the Saturday in 1971 the
>news wire services transmitted the EBS message that said an
>attack on the United States had been detected.

I think I have pointed this out before, but this thread reminds me again... I have a friend who worked on computerizing the UPI wire service in the early to mid 70's (used RCA's Spectra-70 IBM 370 clones). He told me that before this incident the Cheyanne Mountain Norad complex was hard wired into the distribution network for the UPI and AP broadcast wires so that any time they sent characters down the wire from their end it would automatically disconnect the New York national feed or local feeds from state offices and run the Norad message. No editor at AP or UPI got to review the message, control of the wire was completely in the hands of the Norad operator's Teletype as soon as he started a (paper) tape rolling.

After the incident they disconnected all of that magic and of the late 70's (much could have changed since then of course) all the Norad message did was interrupt the editors in New York who could then decide to run it on the wire.

One scary thing about the way they computerized the UPI was that all wires for everywhere went through the main computer complex (initially in New York City, since moved to Texas (Dallas ?)). If the main complex went out there would be no UPI anywhere. The AP took a more conservative approach and had local computer equipment in each state office that could at least originate local news feeds and network to the other local offices if the national (New York) wire control points died.

I haven't kept up with the wire service's current configurations since the revolution in computing power on a desktop and the more recent revolution in wideband digital communications via fiber. I know that the UPI and AP both used satellite systems in the 1980's to distribute news to end users (radio stations and newspapers) and to their offices, but whether they still do, and how they currently handle the control of their national streams of news is unclear to me. In the 70's most news was distributed either by a FDM multiplexed 120 hz channel spaced low speed FSK system carrying 5 level Baudot (used for all the radio and TV wires) and 6 level TTS (teletypesetter used for newspaper wires) or by 1200 baud ASCII (carried everything). Both were sent to the clients over leased private line voice grade data circuits. What is currently used I don't know, but with modern modems and micro's

much more than just one stream of 1200 baud could be sent over a voice grade line, and of course a VSAT terminal can handle tens to hundreds of kbps over a two or three foot dish. (If anybody out there knows how things are now set up I'd be curious to hear).

I'll ignore the insults and simply remark that you infer considerably
more than I implied. I _do_ think that a lot of s/e types consider
themselves above politics. But then, so do the members of most every
group--except politicians.

[much deleted]
> So the scientist (or experimenter) is not well suited to politics.

Gee, that doesn't say much for their adaptability, does it?

I don't accept that there is some irreversible dichotomy between the
so-called "scientific" mind and the "political" one. Such a
characterization is incredibly simplistic. It also runs counter
to my experience (I do have some, in spite of what you assume). I do
agree that all players must be involved in devising solutions to
problems, which is all I was suggesting in the first place, one of the
more effective ways of getting involved being to run for office.

> There must be some way to help this happen in the ARRL and the rest of
> amateur radio. I don't think we've been very successful so far.

No, and if the prevailing attitude is one of "leave politics to the
politicians" we aren't likely to be.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3699. ICOM R71A vs KENWOOD R5000

Newsgroup: rec.ham-radio
Date: 1990-06-24 04:31:00 UTC
From: 812spg@SACEMNET.AF.MIL
Message-ID: <9006240432.AA10810@ucsd.edu>
Source record: 10805

Having used a SONY ICF-2010 for several years, I'm now ready to "upgrade" my SWL equipment. Keeping finances in mind, I've narrowed my selection down to two receivers -- the ICOM R71A and the Kenwood R5000.

My question is, which of these two receivers would give me more "bang for the buck?" The price is the same for both receivers, so what's the difference between the two (if any)?

Any comments on either of these receivers by those who've had the chance to own or operate one would be greatly appreciated. I'd just hate to slap myself in the forehead later on down the road and say, "Wow, I could have had a [fill-in-the-blank]!"

I've got a 731, and the crossband-repeat level is fine on my radio.
Are you unplugging the local microphone when you use the
crossband-repeat mode? That might lower the level some.

Jim, I would be interested in getting information on the electronics
magazine that you were referring to in you post. Thanks.

>magazine that you were referring to in you post. Thanks.

Perhaps I should also help plug WW, having read it since the early 60s when it was known simply as Wireless World. Back then, it was a little different. How can I describe it -- it's like WW is to Popular Electronics as HR is to CQ :-) :-). There were lots of interesting articles that you seldom find anywhere else, e.g., class D amplifiers. These were not construction articles as you see them in other magazines but simply schematics and descriptions of how they work. I loved them as a high school kid.

Between then and now, Wireless World merged with, I think, Electronics (or some such) and is now called "Electronics World and Wireless World." What you have now is a mixture of the old and what reminds you of McGraw Hill's "Electronics." Quite often, there will be some articles of interest (Cross Field Antennas??) to Hams. And sometimes there are articles of interests to audio tinkerers (preamps and amps and the like). Letters to the Editor are truly, umm, how should I say it ... entertaining? (Maybe it is just very "Brit." :-) All sorts of flames regarding CFAs, cold fusion, alternate "theories" (translation: wild ideas that will *never* pass peer review :-) on Relativity, Ether, Shannon's theory and so on. What some people might call pseudo-science.

In the Silicon Gulch, you can usually pick up WW at bookstores such as "Printers, Inc" and "Tower Books." But, hey, this part of W6-land is weird. I don't expect normal bookstores in sane communities to carry it.

This is the info I can find in its pages: subscription rates in the US is stated as $116, airmail, to Reed Business Publishing, 205 E. 42nd Street, NY 10117. The rate seems high, since the single issues go for $5.95 around here and #1.95 (substitute appropriate "pound" sign if necessary) in the UK.

In article <164@bongo.UUCP> julian@bongo.UUCP (Julian Macassey) writes:
> Today you can
>work 100 countries in an afternoon with the AT&T endorsement - Your
>itemised phone bill is confirmation. So people are no longer amazed
>that you can tell someone in Africa that they are "Fahvnahncuessell?"

I keep hearing this, but I don't believe it. I've talked to people who do ham demos for kids, and the kids are enthralled with being able to hear someone in Minnesota, ferevvins sake--all the more so for countries outside the U.S.

In order to call 100 countries, you either have to know someone there or be willing to waste a lot of money on dialing random numbers. Either way, where's the adventure? I believe it *is* still exciting to dial around a band, not knowing who you'll find.

Last year I dialed past the local 440 MHz repeater that has a 10m link and heard a Californian, a Mexican, and an Australian chatting away. All this on a radio that I can hold in my hand! *I* was sure impressed.

Does everyone get reactions from non-hams (or even from hams) like Julian describes? Or are people less blase' than he thinks?

> I have been told that in US schools Geography is no longer a
>subject. Fancy going for DXCC and not knowing where the countries
>really are.

Yeah, well, listen to a DX club repeater sometime and it probably won't cheer you up in this regard. I've been appalled at the lack of knowledge of (1) geography, (2) callsign prefixes, (3) languages, etc. by the so-called hotshot DXers.

> Today I called the ARRL to see if they had any Public Service
>Announcement (PSA) Videos.

I have some print ads for amateur radio that I roughed out a couple of years ago. One is aimed at computer magazines. Some of you won't like it, though, because it starts by suggesting a code key as a relaxing low-tech pastime for a computerist's off-hours. :-) It goes on, of course, to talk about using computers to decode CW, and about packet radio, satellites, etc. etc.

Ad campaigns don't come cheap, though. Anyone want to pony up the money so the League can run stuff like this in the major computer mags on a consistent basis??

As for Julian's suggestion about having PSAs in which people talk
about how ham radio led them to their careers, that's a great idea.
But we don't need to wait until we find a film crew to film PSAs:
that's a great idea for a feature article in a local newspaper or
a professional magazine.

You don't need to write it yourself--have your local ham radio PR
person contact the business or feature desk at the local paper and tell
them about 2-3 well-known people in your area who are hams. (And who
have already agreed to be interviewed.) Contact the editor of magazines
in those people's professions and give them the same lead. I'm working
on just such a project in this area and have a nibble from the business
editor of one of the major Bay Area papers. As valuable a resource as
Newington is, we don't need to wait for them to do everything for us.

Patty

=========
SpaceNews
=========

MONDAY JUNE 25, 1990

SpaceNews is published and distributed weekly around the world on USENET
and Amateur Packet Radio. It is available for unlimited distribution.

* SHUTTLE NEWS *
================
The crew for mission STS-38 arrived at the Kennedy Space Center last week
for the Terminal Countdown Demonstration Test. Atlantis was rolled out to
launch pad 39-A last week. The hot firing test of the orbiter's two APUs
(Auxiliary Power Units) went well. The APUs were run for seven minutes each
at normal speed and for ten seconds at high speed. The launch date for this
mission will be announced this week.

* OSCAR-12 LIVES AGAIN *
========================
Fuji-OSCAR-12 has been heard on recent occasions by G3IOR, G3CAG and G4CUO.
The spacecraft is apparently receiving enough sunlight to produce a weak
battery charging current and support low-power transponder and beacon
operations. FO-12 was switched off by telecommand last year, but apparently
switched back on when it received commands sent to its sucessor, FO-20.
FO-12 transponder and beacon activity cease when it receives strong uplink
signals intended for FO-20.

* CRRES LAUNCH *
================
CRRES, to be launched aboard an Atlas Centaur Rocket on July 9th, will
embark on a joint NASA/USAF mission to study the Earth's magnetic field and
the effects of the radiation environment of space on advanced electronics.
Chemical releases from the satellite in the ionosphere and magnetosphere
will briefly "paint" the waves and lines of magnetic fields with luminous
particles. During the mission's first year, canisters of five chemical
tracers expelled from the spacecraft will create brilliantly visible releases
over the Carribean, South Pacific, and North America.

* CQ DX *
=========
If there are any Amateur Radio operators outside of North America who have
both UUCP and Amateur Packet radio availability and would like to help

distributing SpaceNews through existing packet networks, please send me a note so we can establish a distribution network. I can place interested stations on a UUCP mailing list so they will be able to forward SpaceNews to their local packet systems and help reduce the long delay many foreign stations are reporting before receiving SpaceNews.

* FEEDBACK WELCOMED *
==========
Feedback regarding SpaceNews can be directed to the editor (John) via any of the following paths:

ARRL LETTER - VOLUME 9 - NUMBER 12 - June 15, 1990 - Page 1 of 4

GAY E. MILIUS, W4UG, SK

ARRL Director Emeritus Gay E. Milius Jr., W4UG, of Virginia Beach, VA, died June 6 after a long illness. He was 79, and the husband of Martha Milius.

Milius was vice director of the ARRL Hudson Division in 1951 and 1952, and vice director of the Roanoke Division from 1977 to 1980. He became Roanoke Division director in 1980 and held that post until 1989.

An active DXer and DXCC Honor Roll member, he was the Roanoke Division's representative to the ARRL DX Advisory Committee at the time of his death.

He was a 1933 graduate of Dartmouth College and a 1941 graduate of Fordham Law School. He was a retired commander in the US Naval Reserve and a veteran of the Second World War and of the Korean War.

Besides his wife, he leaves two daughters, Carroll Huffman of Twin Lakes, MN and Mitzi Milius of Aspen, CO; a son, Gay E. Milius III of New York City; and a brother, Howard Milius of Cranford, NJ.

The funeral and burial were June 11 in Virginia Beach.

The family requests that memorial donations be made to the American Radio Relay League.

ARRL LETTER - VOLUME 9 - NUMBER 12 - June 15, 1990 - Page 2 of 4

TRANSCONTINENTAL RELAY AIDS YOUNG SOVIET AMATEUR

American amateurs from coast to coast, using HF as well as VHF FM and packet, have come to the aid of a critically injured Russian amateur.

On May 25 a group of Soviet hams, from the UZ4FWO club station in Penza, were involved in an automobile accident enroute to a radiosport event. RA4FB, Oleg Kolosilin, was killed. Oleg Porugov, UA4FAY, was seriously injured.

Porugov, 25, lies in a coma in a hospital near Ryazan, about 150 miles from Moscow. He suffers from pneumonia and one lung has collapsed. Hiscondition prevents doctors from moving him to better facilities.

Porugov's attending physician, a Dr. Makarov, has stated "In small Soviet towns the doctors can be good, but medical supplies--even disposable syringes--are scarce."

In daily contact with Makarov is an American neurosurgeon, Dr. Joseph Izzo of Foster City, Calif. Izzo responds to Telex and E-mail messages from Makarov, answering questions by Amateur Radio. The responses, carried on a daily schedule, are between the stations of Len Traubman, W6HJK, a dentist in San Mateo, and UZ4FWO, in Soviet Russia. Help with relaying and translation has been provided by Ed Kritsky, NT2X, and Angel Garcia, WA2VUY.

Kritsky, who came to the United States from Leningrad in 1978, took a telephone call shortly after the accident from another American amateur. "UZ4FWO needs to talk to you, Ed. They need medical consultation."

Kritsky asked Igor, the UZ4FWO operator, if he had any American ham acquaintances in the medical profession. Igor suggested Traubman and Dr. Lawrence M. Probes, ND8S, who also has acted as a relay station. Meanwhile, Kritsky also had contacted a local physician, Dr. Anatoly Barkan of Brooklyn, another Soviet emigre.

Igor passed the condition of the patient to Kritsky via Amateur Radio, and Kritsky sent it by facsimile to Traubman and Dr. Izzo (who although not a ham, paid for the initial shipment of drugs).

In addition to medical advice, several hundred dollars worth of supplies for Porugov, including powerful antibiotics and special tracheal tubing, have been arranged for and shipped from the United States. Charles L. Starke, NX2T, a medical internist, arranged for the tubing, which was shuttled to JFK airport by Alan Singer, N2KW.

Singer located Starke using the Tri-State DX PaketCluster Network.

Thanks to Amateur Radio, Soviet amateurs have been able to receive word that the shipments are enroute, allowing them to get to tche Moscow airport in time to arrange for expeditious treatment by customs authorities. One of the UZ4FWO operators has been standing by in Moscow to receive the shipments.

Kritsky observed that initially the chief of medicine in Ryazan was skeptical of these arrangements, of taking advice from outsiders. "But once he heard the tone of voice of those talking on 20 meters," Kritsky said, "he knew we were there to help. He knew we cared."

"We are just a few American hams doing what we can," said WA2VUY. "If Igor were not a ham, none of this probably could have happened," he said.

On Monday, June 11, 17 days after the accident, Oleg Porugov, UA4FAY, opened his eyes for the first time, and moved his hand.

MORE HAMS IN SPACE

Three more astronauts soon will have Amateur Radio call signs, joining Ken Cameron, KB5AWP, aboard STS-37 (a SAREX mission) in November. Flight commander Steve Nagel and mission specialists Linda Godwin and Jay Apt all have recently passed Technician class exams. Godwin and Nagel took their

exams in Dallas at the Ham Con on June 9, where Cameron upgraded to General class. Nagel passed his test in May.

The fifth STS-37 crewmember, Jerry Ross, has yet to take the plunge, but he "has some books on his desk," according to Cameron.

Space Shuttle STS-35, also a SAREX flight by astronaut Ron Parise, WA4SIR, was postponed again May 29 and has been returned to its hangar for major repairs. Since another Shuttle, carrying a military payload, is scheduled for launch soon, STS-35 has been pushed back to at least August.

KANSAS CITY HOSTS NATIONAL CONVENTION

More than 5000 radio amateurs attended the 1990 ARRL National Convention June 9 and 10 in Kansas City, MO. The convention, sponsored by the PhD Amateur Radio Association, featured forums on many areas of interest to amateurs, as well as a very strong turnout by manufacturers and retailers of Amateur Radio gear.

Banquet speaker Dave Bell, W6AQ, entertained some 350 guests with his presentation "The King and I," recounting how King Hussein, JY1, of Jordan, came to appear in the 1979 ARRL film "The World of Amateur Radio."

In addition to the *Westlink* Young Ham of the Year award given to Mary Alestra, KB2IGG (and reported earlier), Advanced Electronics Applications made their fifth Amateur Ambassador Award to James Heil, KB5AWM. The 22-year-old Heil, of Houston, was instrumental in creating the Clear Lake Amateur Radio Club, a general interest club with a special mission to recruit and train new amateurs.

Also in attendance was Ralph Haller, chief of FCC's Private Radio Bureau, who hosted an informal question and answer session attended by more than a dozen League directors and other officials.

HQ HOSTS OPEN HOUSE

On June 3 ARRL HQ and W1AW hosted several hundred visitors during the annual Open House. Coinciding each year with the Newington Amateur Radio League's hamfest, the event this year featured tours of the newly renovated W1AW, where visitors were able to operate as well as use two computers (recently donated by the Tandy Corporation) in conjunction with various logging programs and databases.

Lab supervisor Jon Bloom, KE3Z, demonstrated for visitors the League's setup for measuring transmitter spectral purity, with a commercial 2 meter FM transceiver and a Hewlett Packard spectrum analyzer. Visitors also got a peek at a 20 meter transceiver being designed by staff member Zack Lau, KH6CP, showing several stages of the development process. This rig is being designed for production and donation to amateur societies in third world countries.

DXCC BEGINS MOVE TO DATA PROCESSING

DXCC automation has begun in earnest, with final testing of software completed June 1. New applications and endorsements are entered into a mail log for tracking through the system. This log helps staff members quickly answer questions regarding the status of DXCC applications and endorsements in progress. On June 11 "backfilling" began--the process of entering past records into the computer on a priority basis. As endorsement applications are received they are backfilled to bring the applicant's record up to date; the endorsement is then processed.

* Last week, a formal application for DXCC status was received at HQ for the Penguin Islands, a string of 13 islets off the coast of Namibia. The application, made by DK9KX, KC1AG, and ZS9A, indicates that the islands are claimed by South Africa, and propose DXCC status based on the islets' meeting the 75-mile minimum separation from S. Africa. It can be expected that the the DX Advisory Committee will require several months to deliberate on the application.

MORE ON SCANNER LAWS

ARRL has submitted to FCC reply comments supporting preemption of local and state laws regulating the use of mobile radios by licensed Radio Amateurs. In its May 31 comments, the League pointed out several comments filed in the proceeding that buttressed the League's position.

The League contends that possession by licensed amateurs of radio receivers that incidentally cover public safety frequencies should not be prohibited by local or state laws. This, the League pointed out, is supported by the Associated Public-Safety Communications Officers (APCO), "the nation's oldest and largest public safety communications organization."

Comments filed by Uniden America Corporation noted that all radio communications are interstate, and as such the state and local laws which prohibit the possession of radio receivers by licensed amateurs interfere with "instrumentalities of interstate commerce," which should not be permitted.

The League requested that "the Commission determine that statutes or local ordinances which preclude the possession of radio equipment by licensed radio amateurs merely because such equipment is capable of reception of police or other public service communications conflict with Federal communications law and policy, and are therefore void."

NOVICE TICKET COMING TO GREAT BRITAIN

Great Britain will have new Novice class licensees sometime in 1991, according to Radio Communication, the official journal of the Radio Society of Great Britain. The final draft of the Novice License was announced April 19.

Recognizing "the value of amateur radio as a training ground for careers in electronics and radio engineering," ministers of the Radiocommunications Agency approved, according to *RadCom*, the following guidelines:

A Novice Class B license, permitting operation on 50 and 430 MHz, as well as on 1.3 and 10 GHz. Passing of a 5 wpm Morse test after one year as a Novice Class B licensee will allow the licensee privileges on 1.8, 3.5, 10, 21, and 28 MHz, with 5 watts dc input. The 28 MHz privileges include radiotelephony in the 28.3 to 28.5 MHz segment.

(In Great Britain both "full" and Novice licensees are designated either "A" (including CW) or "B" (codeless).

It should be noted that after 25 years of a codeless "full" license (with full privileges above 30 MHz), Great Britain now prepares to institute a Novice license along the lines of the Novice license that has existed in the US for more than 30 years.

Training courses conducted by RSGB will be followed by a written exam for the Novice Class B license. June *RadCom* features an article on preparing to teach such classes.

* On an unrelated matter of interest from England, the April 1990 issue of RadCom reports the results of a survey of 10 "old timers" (over 50 years old). These CW operators were first asked to specify at what frequency they preferred to copy code, then were allowed to actually copy CW. The frequency of the tone they chose was measured, and averaged about 500 Hertz. Manufacturers who design transceivers should note this. "The impact on AF filter design and BFO crystal selection," RadCom says, "is obvious."

BRIEFS

* The latest issue of *WARC Countdown*, a newsletter to all IARU member societies, stresses the need to "ensure that at least one suitably qualified radio amateur is designated as a full participant in his country's WARC-92 delegation." Member societies are encouraged to, if necessary, first convince their governments of the value of Amateur Radio, then to make a ham a delegate. "It goes without saying," the newsletter says, "that the case for Amateur Radio at WARC-92 can best be made by a ham."

* ARRL Volunteer Counsel Frank Terranella, N2IGO, has announced a meeting and forum in conjunction with the ARRL Hudson Division Convention on Sunday, July 8, at the New York Institute of Technology. A one-hour meeting of all the division's VCs will be followed by a public forum, where VCs will answer questions regarding legal issues of concern to hams. For more information, contact Terranella at 201-947-4100.

*Every new ham is special, but Jack Lee is something else again. He eagerly awaits arrival of his Novice ticket after passing the exam May 30 under the watchful eyes of the Newington Amateur Radio League and the Pioneer Valley (Connecticut) Radio Association. The test, administered at W1AW, concluded a licensing class directed by N1FCK and W1VMY. By the way, Mr. Lee's full name is John Maxim Lee, and his grandfather was Hiram Percy Maxim, founder and first president of ARRL.

* FCC has denied a request to establish an Amateur Radio "license" free of any examination. The request for rule making, by Donald L. Stoner, W6TNS, was for a "digital communicator class" permit that would have allowed

licensed amateurs to grant permission to up to 26 non-licensed persons to be control operators. Proposed operations would have been on the 33 cm amateur band.

In its denial, dated May 22, the Commission cited federal law precluding operators who have not demonstrated "their qualifications" to the Commisssion.

* The *RSGB Microwave Handbook Vol. 1* is the latest addition to the ARRL library. Edited by G3PFR, it covers microwave theory and practice in mostly non-mathematical language. Two additional volumes will follow. 224 pages.

* Don't forget Field Day! It's June 23 and 24 this year, and there's just time to request a Field Day package from HQ. Rules are in May *QST*, pp 84 and 85.

* The June issue of *QEX*, the ARRL Experimenters' Exchange, features a system for TNCs using NET/ROM software to prevent packet collision. This should be of special interest to operators of PacketCluster and similar networks.

* July *QST* solicits nominations for director and vice director in the following ARRL divisions: Central, Hudson, New England, Northwestern, Roanoke, Rocky Mountain, Southwestern, and West Gulf. See the July *QST* "Happenings" column for details.

3706. Re: Homebrew repeater controllers

Newsgroup: rec.ham-radio
Date: 1990-06-25 03:31:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500575@ux1.cso.uiuc.edu>
Source record: 10811

> I'm interested to know if anyone has built a repeater controller based
> upon an IBM PC or clone. I'm willing to dedicate the entire PC with
> harddisk to the repeater controller operation.

It seems like a lot of money to me to tie up in a controller.

> I would expect that the controller would offer all the features of
> the ACC line plus things like:

Well, these things are about as expensive (and in my opinion, not worth
it due to lack of the features I want).

> Has anyone built the necessary interface hardware? I'd be more likely
> to program such a thing if I didn't have to build the hardware.

It would be nice to have all the functionality of a controller for a
repeater on a single board you can plug into a PC. I had asked about
the interface between controllers and the actual repeaters some while
back here on rec.ham-radio, and the general concensus I got was that
there is not standard interface bewteen the repeater hardware and the
controller. I don't know what assumptions, or excess hardware for all
the variations, controllers like the ACC ones have.

I would consider the following connections to be essential:

Controller ---> Repeater
1. On/Off (PTT) the transmitter.
2. On/Off the audio.
3. On/Off the transmit CTCSS.
4. Audio from CPU for ID, battery mode indicator, etc.

Repeater ---> Controller
1. Carrier level
2. Discriminator noise level
3. Discriminator output
4. Audio

Other ---> Controller
1. Battery voltage
2. Battery current
3. PA voltage
4. PA current
5. SWR
6. Tower lights current
7. Clock/Time

Whether or not things like CTCSS decoder/encoder, DTMF decoder/encoder, squelch level, etc., should be in the "radio" or on the controller are probably religious issues. I personally want CPU control over these things so I can do everything from setting them remotely to programming them to dynamically change to meet conditions. For instance, I would want different squelch levels in effect for "idle" and "ready" states (idle is when the repeater has not been transmitting lately; ready is between transmissions of an active QSO) so that it requires a good signal to bring up the machine, but it will tolerate some fading during the QSO. Likewise a different set of squelch levels would be required if CTCSS is present (to allow locals to access w/o CTCSS, but DX needs CTCSS). Another possibility is to allow users to turn off the need for CTCSS on a per-QSO basis (it comes back on when the machine goes to idle state). Perhaps CTCSS could be required to bring up the machine, and not needed once it is up. I could put all these things in a huge matrix and plug in LOTS of values to program the machine with, and I know that ACC controllers cannot do this.

Cross-band and multi-band repeaters need even more sophisticated control, especially when multiple receivers are concurrently receiving different but good signals; what do you want your repeater to do?

I, too, prefer to program the software (and I mean writing machine/assembly code, not CONFIGURING as you would do to an ACC even though they CALL that "programming") instead of building the hardware. However, building a controller from a PC compatible mother board, or perhaps (depending on just how easily boards can be added) Kantronics new DataEngine, seems like a reasonable way to get the hardware in place ready for programming. Having a hard disk is not essential, but does give you some flexibility. You could, if you are careful, upload new controller code via radio.

>
>-Steve Schallehn, KB0AGD

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

> I was running a Uniden 2510 with no amp and told me I was
> not only 59+ but louder than some fellows who told him they
> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

The majority of us shmucks are running 200 watts input and are doing just fine. I'd bet that a vote to reduce max input power on HF to 200 would pass! (if it could only be put to a vote...) Sure, some would still have amps and/or build them, but I'd also bet that *most* of the KW ops couldn't build one. Imagine how one of us 200 watters sounds to a QRPer. Same difference but a move in the right direction.

I, personally, wouldn't mind it if omnidirectional antennas were also illegal. Why should anybody expect to own a frequency in *every* direction. I'd be happy, though, to just have a lower power limit. One can do *so* much with antenna's - it's amazing.

We'd have *alot* more room on our bands if people used directional antennas and ran reduced power. The latter would force the fomer somewhat.

Perhaps we should all go back to nursery school and kindergarten and learn how to share.

What a deal - my $100 worth - for free!

This is very excellent advice and a *very* effective way to make your point to them. Much quicker than composing a letter which will get scanned at best. I'm going to cancel. If and when they want to send me free copies of a new-and-improved CQ to entice me to sub I'll scan it. Remember, money talks and bullshit walks. They *are* touting the "new" subscription numbers to advertisers. You can bet that the advertisers are watching the sub numbers.

If you have the time, you should also perhaps indicate to them what will make you subscribe. Perhaps a technical journal? Give them suggestions and alternatives if you do this.

The other day I received the July issue of CQ. To say that it is garbage would be the understatement of the year. Maybe if enough people write to IEEE they can publish a Transactions on Ham Radio, or something....
In any event, with the passing of Ham Radio seems to be an omen that the technical side of amateur radio may be doomed to extinction, along with flying, and any other hobby that involves active participation/learning (read: EFFORT) on the part of the individual. Could this be a reflection on American society in general ?

Magazines related to ham radio from Ulrich's International Periodicals Directory 1988-89 edition. Comments on the content or value of any of these from those who have seen them would be appreciated. I might have missed some of the foreign language ones since it didn't always give a hint as to the subject matter. Also, the US magazine "Ham Radio" was not included in their list. I don't know what the criteria was for inclusion in their listing. If you notice an omission, please send me the relevant info, so I can maintain the list. Enjoy.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the
formula that made them successful. The magazine appealed to
the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a
great mix of electrical engineering, amateur radio, general
electronics hobbyist stuff, basic theory and pseudo-science.
The downside is 1) ads are for UK products 2) prices are
in pounds 3) words like color are spelled 'colour' 4) expensive
in the US.

I also got my copy of CQ (instead of Ham Radio). I guess i'll let the subscription expire (October or so), but i'll not renew it. It would be nice to see a list of other magazines that are available, cost, etc. I'm afraid there is not a lot of choice. QST is ok, but there sure is a lot of contest, ARRL news, etc, etc, etc.

one of the best ways to support science education is to become INVOLVED in the science fair programs in a local school. If they don't have one start one (with the help of the local school). One has to be careful not to step on the toes of the local science teachers, principles, etc. but I've found them to be open to ideas, HELP, etc. We raised money for prizes, organized field trips, etc. It works. A ham radio display at a local science fair would be a good idea.

>

I have some vague idea what its all about, but if there are more knowledgeable contesters on the net, please come to my aid.

The OCTOPUS is a switching network which connects a number of operating transmitters, but only allows a single transmitter to transmit at any given time. The idea is that you can have multiple band positions active at the same time, but since the octopus prevents you from putting more than one signal on the air at any given time, you can submit your log as MULTI-SINGLE rather than MULTI-MULTI. Clearly, the performance of the station using an octopus is going to be closer to MULTI-MULTI and far beyond anything you hope to achieve with the traditional MULTI-SINGLE.

I believe the octopus was first introduced by a very cleaver bunch at one of the big eastern european contest clubs. I would not view it as "illegal" but rather as a very clever innovation. Subsequent to its introduction, I believe, the rules of the CQ World Wide DX Contest were revised to exclude its use in MULTI-SINGLE.

I have not looked closely at FD rules, but perhaps they are not properly phrased to exclude the octopus? If so, be careful not to criticize the operators for "illegal" operation- they may just be more clever than the rest!

3722. FT101B vs FT101E

Newsgroup: rec.ham-radio
Date: 1990-06-25 17:37:00 UTC
From: MULTI@TRIUMFER.BITNET
Message-ID: <90Jun25.133735edt.58193@ugw.utcs.utoronto.ca>
Source record: 10821

The previous reason for my query was that I had an excellent opportunity to buy a Yaesu FT101E, and was unsure whether it came with RF speech clipper. It turns out that the FT101E does have a factory-installed speech clipper, and the deal included a Yaesu FV101 vfo, all for the price of $499 Canadian. Now if I can locate a Yaesu antenna tuner which covers 160 meters, I will be all set.

Y.N. Miles,
<MULTI@TRIUMFcl.bitnet>

ps: I replaced the 3SK40 dual-gate mosfets with Motorola 3N211 mosfets.

3723. Re: Amateur Auxiliary

>
>Are there any members of the Amateur Auxiliary here? What ability does the
>(ahem) AA :-) have to help control this sort of crap that's going on on 20M
>and elsewhere? I would love to get in on such an activity. Just tuning
>around, I hear so much garbage and feel helpless to do anything about it, as
>many others have stated here.

I guess I qualify as a member of the auxiliary (OOC for SCV ;-)
so I'll try to answer some of your questions. The Amateur Auxiliary
is able to send notices to stations who the OO believes is in some
manner not complying with Part 97. This can be anything from
not IDing every ten minutes to jamming. This is an attempt at
self-policing. The OO doesn't have any special powers, he's just
another ham, no more than that.

>How does the Auxiliary work? I guess I can whip out the Handbook. Hmmm...
>precious little. It refers to an article in QST of Aug '84.

Well, we listen alot. If we hear something that sounds like a violation
we'll write a card to the station we heard. The card indicates what
the OO heard, along with a reference to the relevant section of Part 97.

If a problem persists the OO can bring the situation to the attention
of the OO Co-ordinator for his section. The OOC can either ask
for help from what is known as the Regional Monitoring Station
or try to deal with it himself. In my section I worry mostly about
VHF problems, and will try to deal with these myself. If its an HF
problem I'll pass it up the chain to the RMS.

The RMS stations are appointed by directors and are the ham
equivalent of the FCC monitoring stations. There aren't to
many of these stations. In CA we have a total of 3(that I'm
aware of).

When a problem can't be solved by peer pressure then the only
choice left to the OOC/RMS is to turn the problem over to the
FCC. Before this can happen the OOC/RMS must inform the ARRL
division director about the case. How this turn over occurs
is different in each section. My section (Santa Clara Valley)
has a Memorandum of Understanding with the the San Francisco
FCC office about how this is to happen. This agreement has
been in place for just a year and we've had pretty good results
so far.

The FCC in our section requires that we supply them with information
about what the we believe the violation is, when it is occuring, and
which city we believe the station to be located. The biggest part
of this list is the nature of when the offense is occuring. It
must be repetitive and predictable for the FCC to come out. They
don't have a great deal of man-power so FCC uses the amateur
auxiliary to do some of the foot work before they show up on the
seen. FCC gets alot of calls of the sort "Well, this guy is on
the repeater and he's cussing all the time." So the FCC asks
when he's on and gets the reply "Oh, he's on all the time...I heard
him on last night, then he was on maybe a week ago in the morning."
That's why the repetitive/perdictable part ;-)

>But hey, if we all write to our section managers (the guys that control the
>Auxiliary for their area) and find out about this, maybe we CAN do something!

Feel free! I can assure you that the next SM of the SCV has a pretty
good understanding of the situation here ;-) and for that matter the
current one does too (Glen, WB6W, is my partner when I go out on
most of my DFing expeditions.) Your SM can at least direct you
to the OOC in your section.

The real problem we have isn't VHF because that can be dealt with
fairly effectively at the local level. HF with its' capability
of spanning the country/globe is harder nut to crack. How do
you DF someone thats half a continent away, then do something
about it? I'm not sure there is a good answer for this one.
I sure don't have it anyway....

>I'm not one to advocate "tattling" on a fellow ham, but if he is deliberately
>abusing the privilege, than screw it! Let the FCC know and hope that $1000
>fine does the trick!

This is a fine point that maybe needs to be discussed. The Auxiliary tries
to use peer pressure to get people to moderate their behavior. Thats
the only tool we have. We aren't band cops, just merely other hams that
have to live-on/use the same frequencies. When peer pressure fails then
the FCC is the only resort we have. FCC also gives a person one chance
before fines start getting levied. If the person heeds that warning
that will be the end of it. This is what happened in the two casses
that I've turned over to FCC in the last year. I'm glad it turned
out that way. The two offending parties started behaving themselves
and that was the end of it.

>What do you all say? I have not heard of ANYONE being in the Aux., nor have I
>heard any mention of it in all my many years of hamming. (1.5, to be
>precise!) :-)

Well now you've heard from someone ;-) I'll be glad to try and answer
any questions you've got.

This raises an interesting question: how many big guns do you think limit themselves to 1500? I would not be surprised if there were one hundred stations running at least 10kW in the US. There will always be people who run as much as they please regardless of the rules. Not to say that they are necessarily bad ops (whatever that means :^).

> mountains. If that doesn't stimulate interest, I dunno what will.
>
OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote
call, or getting help to someone stranded in a flood or earthquake, is on
the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club
or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings
about ham radio? If not yourself, maybe someone from your radio club is not
uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of
us were looking for. I unfortunately, between work and running code practice
for the club and helping out with the VE team have plenty to do. If I had
about three more nights per week, I'd like to seek out new life and new
civi-... oops... new organizations that need programs and present to Lion's
Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire
Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what
rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a
firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an unedditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Just a word of caution - disk drives are less rugged than most electronics.
If the controller spends most of it's time in an air-conditioned shack, it
should be fine. :-)

Maybe one slightly different tack is to approach the TEACHERS, make resources and training availble to them, and offer to assist with transferring it to the students.

I get the impression a lot of teachers feel tied up with budget constraints and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting a dozen students involved...

Just a thought!!

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the
propagation was poor for that weekend, you should have a look at it
now. Even the intruders are missing. But we have received some logs,
and from some of the scores there was little to complain about. Keep
the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT,
VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster.
Thank you all for your assistance. Every little bit helps.

EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

~~~~~~

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

*** AS of Nov 1, 1989 FTP access from the internet is available
HAMSTER.business.uwo.ca [129.100.22.100]

To access a file from the archive via mail, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message MUST be -> MODS
If your mailer does not ask for the subject; make the first line of your
message look like this:

SUBJECT: MODS

The server ignores all messages that do not have MODS in the subject
field. All bad requests get re-routed to my userid ,and I eventually
read them, fix them, and re-submit them.

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.

RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

Below is an example of a file request message:

```
.....................................................................
.
. Date: Friday, April 5, 1989
. From: MBRAMWEL@BUSINESS.UWO.CA (Mark Bramwell)
. Subject: MODS
. To: bitlib@uwo.ca
.
. from: mbramwel@uwo.ca
. sendme radio mods
. sendme pro2004 mods
. sendme tm721 mods
.
.....................................................................
```

In the above example I have a 'from:' line in my message. That will
tell the server to send to an id other than the id listed in the
header. The userid should be reachable from bitnet. That means
UUCP users should include a gateway in their id.

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable
address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:

From: rdw2030@venus.tamu.edu
Message-ID: <55207@lanl.gov>
Source record: 10751

Well, what do you think would be the effect of a mass mailing telling the ARRL what we would like to see in QST? All of us sitting on here saying QST's ok, BUT... That doesn't fix the problem!

I think it needs to be BIGGER! Not necessarily in size, but content! Have you ever noticed that fully ONE-HALF!!! of QST is ads? It's really a bit more than that, considering the ads that come between articles and such. That's pathetic!! I subscribe because I feel I need to keep a leg in somehow but it IS a bit sad! It's almost like BYTE!

Where's the beef? I agree... we need more technical stuff!!! I wonder how many people subscribed to Ham Radio. If someone started up a strictly "high-tech" ham magazine, I wonder how much support they could realistically expect. As was mentioned before... the mag can only be as good as its submissions!

SB ALL @ AMSAT $ANS-174.01
EUROPEAN FIELD DAY

HR AMSAT NEWS SERVICE BULLETIN 174.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

While amateurs in North America were involved in Field Day '90 (scores of stations were working AO-13 alone!), plans were underway for a similar emergency communications test in Europe the following weekend. AMSAT Education Advisor, Rich Ensign (N8IWJ) relays the following details:

Jurgen, DG7NBH reports that hams in the Nurenberg, West Germany area are gathering for their annual test of emergency operations on June 30, 1990. Jurgen and his group have a special emphasis this year. They are calling their event an "American Activity Day." American hams living in the Nurenberg area are being invited to the operations site to share in contacting as many stations in the U.S. as possible. Jurgen will have his Mode B OSCAR station on site and he will be found on OSCAR 13 on a downlink frequency of 145.925 MHz between 20:00 and 22:30 UTC. At that time there is an excellent window between the U. S. and Europe. Why not give DG7NBH a call!

SB ALL @ AMSAT $ANS-174.02
ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 174.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

Last ZRO Test of the Current Set to be Held Last Saturday in June

You have one more chance to test out your receive station on AO-13 during the latest round of The ZRO Memorial Technical Achievement Award Program. The "ZRO Test", which is a test of operating skill and equipment performance, has been run over the past few weeks and will conclude at the end of June.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive,

Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures, means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB ALL @ AMSAT $ANS-174.04
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 174.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 23, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.4 and BLAT = -4.1 for 25 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

From: depolo@eniac.seas.upenn.edu
Message-ID: <26434@netnews.upenn.edu>
Source record: 10744

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into memory to prevent unnecessary use of the disk drive and also to increase speed. But that's probably pretty obvious. I can't think of any real reason why the computer would have to write anything to disk as the repeater is used. What's there to be logged that easily be converted to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED
AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268
SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE
23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER
LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER
THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS
PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT
18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK,
EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT
TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE
TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT
MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY.
IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND
125 WITH A MEAN OF 95.4. AR

>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775
region, and most of them do not require a tone burst to start them up. The
offset is as in the US, -600 Kc for the input frequency. On 70cm most of
the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift
for the input frequency. Remember the bandplan is a lot smaller in Holland
for 2m and 70cm as it is in the US, but you can easaly find that your
reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess
they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement,
but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think,
you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted
before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance
too.

Hope to hear you.

>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance

is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to
a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line
aren't considered in this. But it still indicates that small loops *might*
work pretty well. Whether the AEA job does or not is still an open question.
Hopefully, someone out there will actually TEST one and let the rest of us
know.

>
Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be
a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries
to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be
bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that
fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast
them locally.)

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

>
OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote
call, or getting help to someone stranded in a flood or earthquake, is on
the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club
or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings
about ham radio? If not yourself, maybe someone from your radio club is not
uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of
us were looking for. I unfortunately, between work and running code practice

for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

J73EH 14082 at 0440Z
EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the
callsign of AN9CI. The call was changed at the last moment, but it
was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux)
on June 23/24. They will operate all bands and modes (including CW on
10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but
propagation has been very poor, and someone has taken Africa off the
map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU.

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,
faster way to do something and don't publish, it's as if you never
thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power
(tube) RF amps. Does one already exist ? I don't know - I haven't seen
one yet.

By the way, I find this newsgroup to be a powerful counter point to the
regular mags. We can say what we want against CQ and QST in an uneditted
manner. We can also exchange ideas in a way not possible via a magazine.
I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the
formula that made them successful. The magazine appealed to
the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a
great mix of electrical engineering, amateur radio, general
electronics hobbyist stuff, basic theory and pseudo-science.
The downside is 1) ads are for UK products 2) prices are
in pounds 3) words like color are spelled 'colour' 4) expensive
in the US.

> about full-out at HQ.
Let me see, same number of bods and 40% more members, that makes 40%
more money.

So what is happening at HQ? Let the ARRL themselves tell us how
these scarce resources paid for by our subscriptions (Yes, mine as
well) are advancing the radio art and challenging the borders of
engineering and science:

+ ARRL LETTER - VOLUME 9 - NUMBER 12 - June 15, 1990 - Page 3 of 4

+ HQ HOSTS OPEN HOUSE

+Lab supervisor Jon Bloom, KE3Z, demonstrated for visitors the League's setup
+for measuring transmitter spectral purity, with a commercial 2 meter FM
+transceiver and a Hewlett Packard spectrum analyzer. Visitors also got a
+peek at a 20 meter transceiver being designed by staff member Zack Lau,
+KH6CP, showing several stages of the development process. This rig is being

+designed for production and donation to amateur societies in third world
+countries.

We are going to pay for the third world to get free U.S. Built
radios? For 20M too no less.

+ DXCC BEGINS MOVE TO DATA PROCESSING

+DXCC automation has begun in earnest, with final testing of software
+completed June 1. New applications and endorsements are entered into a mail
+log for tracking through the system. This log helps staff members quickly
+answer questions regarding the status of DXCC applications and endorsements
+in progress. On June 11 "backfilling" began--the process of entering past
+records into the computer on a priority basis. As endorsement applications
+are received they are backfilled to bring the applicant's record up to date;
+the endorsement is then processed.

I wonder how many Microwave columns in QST this would pay for? But hey
gotta keep proving to ourselves that with a modern equipment it is
technically possible to talk to at least 100 countries, even if some
of them are uninhabited reefs. What will we do when the contesters die
off?

+* Last week, a formal application for DXCC status was received at HQ for the
+Penguin Islands, a string of 13 islets off the coast of Namibia. The
+application, made by DK9KX, KC1AG, and ZS9A, indicates that the islands are
+claimed by South Africa, and propose DXCC status based on the islets'
+meeting the 75-mile minimum separation from S. Africa. It can be expected
+that the the DX Advisory Committee will require several months to
+deliberate on the application.

My fees pay to prove that more desert islands are really countries?
No wonder they are busy at the ARRL, this is important stuff. We can't
just leave it up to the UN to decide who and what is a country.

+ * The *RSGB Microwave Handbook Vol. 1* is the latest addition to the
+ARRL library. Edited by G3PFR, it covers microwave theory and practice in
+mostly non-mathematical language. Two additional volumes will follow. 224
+pages.
I recall a time when the ARRL produced manuals that were respected
all over the world. Now we have to get the RSGB (1/10 size of ARRL) to
produce books on Microwaves etc. The book probably has metric
dimensions too.

In article <1990jun21>att!cbnewsj!mea1@ucbvax.Berkeley.EDU (michael.e.alterman) writes:

>We are planning a vacation to Denmark and the Netherlands this summer.
>My wife and I are both licensed hams and we would like to bring our HT
>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED
AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268

SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

To: info-hams@ucsd.edu

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775
region, and most of them do not require a tone burst to start them up. The
offset is as in the US, -600 Kc for the input frequency. On 70cm most of
the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift
for the input frequency. Remember the bandplan is a lot smaller in Holland
for 2m and 70cm as it is in the US, but you can easaly find that your
reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess
they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement,
but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think,
you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted
before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance
too.

Hope to hear you.

Subject: Dubious quality of CQ review of AEA IsoLoop
To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance
is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to
a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line
aren't considered in this. But it still indicates that small loops *might*
work pretty well. Whether the AEA job does or not is still an open question.
Hopefully, someone out there will actually TEST one and let the rest of us
know.

>
Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be
a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries
to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be

bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that
fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast
them locally.)

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be
difficult to implement. PC's are nice because most of the hard work that
would normally have to be done in hardware in a non-CPU based repeater
can be done in software. Access codes can be easily changed, PROMS
don't have to be burned for different CW ID's, the ID's themselves can
be generated by the computer, etc. The way I see it, the above caveat
can easily be remedied by not using floppy drives/a hard drive in normal
operation. The system should be set up so that upon booting, both the
control software and all data necessary to run the repeater, including
the custom control codes, ID's, messages, etc. should all be loaded into
memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted
to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly
communicate with the computer byte-wise. Control lines on the RS232 port
make handy binary lines. Having the computer set lines high is a quick
and efficient way of flipping relays, keying CW, etc. They can be used
as input as well - have a receiver set the line high when a signal
opens squelch. It's a lot easier than having to read and write 8 bits
on the data lines and allows for more than one device to be connected
to the computer unlike 2-device serial communications. And if one
port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost
less than $500 new, probably under $300 used. If money is really

tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be
getting DTMF tones from the receiver to the computer. That shouldn't be
all that difficult either. Less than 5 chips in actuality. Take
a DTMF decoder and a UART and you're 99% done. Things like detecting
S/N for voting or detecting PL might be a bit more difficult, but they would
be necessary in a non-computer-based repeater anyway. Control of the
repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

>We'd have *alot* more room on our bands if people used directional antennas
>and ran reduced power. The latter would force the fomer somewhat.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

>
OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

73,

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,
faster way to do something and don't publish, it's as if you never
thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power
(tube) RF amps. Does one already exist ? I don't know - I haven't seen
one yet.

By the way, I find this newsgroup to be a powerful counter point to the
regular mags. We can say what we want against CQ and QST in an uneditted
manner. We can also exchange ideas in a way not possible via a magazine.
I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the
formula that made them successful. The magazine appealed to
the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a
great mix of electrical engineering, amateur radio, general
electronics hobbyist stuff, basic theory and pseudo-science.
The downside is 1) ads are for UK products 2) prices are
in pounds 3) words like color are spelled 'colour' 4) expensive
in the US.

3745. HDTV and Waveform Modulation

Newsgroup: rec.ham-radio
Date: 1990-06-26 08:23:39 UTC
From: cfogg@milton.u.washington.edu
Message-ID: <4454@milton.u.washington.edu>
Source record: 10746
Cross-posted to: rec.video,sci.electronics,rec.ham-radio

A new term to add to the HDTV glossary, waveform modulation is given a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona claims they can "squeeze a full-blown HDTV signal and a conventional NTSC signal within the same 6 MHz frequency channel" by using "a new modulation technology to add information to the spectrum without interference."

Richard Gerdes, PSI co-founder, explains that their technique "alters the shape of the carrier and transmits the result of that altered wave shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation for NTSC broadcasts: an encoder and decoder that allows an NTSC station to broadcast two channels simultaneously from one transmitter. "You could tune to channel 4A or 4B using the decoder," Gerdes says. The FCC has already granted an experimental license for channel 11 in Tuscon, a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on waveform modulation; PSI's technology? And does WM have implications for other EM-based communications?

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think,
you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted
before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance
too.

Hope to hear you.

To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance
is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to
a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line
aren't considered in this. But it still indicates that small loops *might*
work pretty well. Whether the AEA job does or not is still an open question.
Hopefully, someone out there will actually TEST one and let the rest of us
know.

>
Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be difficult to implement. PC's are nice because most of the hard work that would normally have to be done in hardware in a non-CPU based repeater can be done in software. Access codes can be easily changed, PROMS don't have to be burned for different CW ID's, the ID's themselves can be generated by the computer, etc. The way I see it, the above caveat can easily be remedied by not using floppy drives/a hard drive in normal operation. The system should be set up so that upon booting, both the control software and all data necessary to run the repeater, including the custom control codes, ID's, messages, etc. should all be loaded into

memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted
to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly
communicate with the computer byte-wise. Control lines on the RS232 port
make handy binary lines. Having the computer set lines high is a quick
and efficient way of flipping relays, keying CW, etc. They can be used
as input as well - have a receiver set the line high when a signal
opens squelch. It's a lot easier than having to read and write 8 bits
on the data lines and allows for more than one device to be connected
to the computer unlike 2-device serial communications. And if one
port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost
less than $500 new, probably under $300 used. If money is really
tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be
getting DTMF tones from the receiver to the computer. That shouldn't be
all that difficult either. Less than 5 chips in actuality. Take
a DTMF decoder and a UART and you're 99% done. Things like detecting
S/N for voting or detecting PL might be a bit more difficult, but they would
be necessary in a non-computer-based repeater anyway. Control of the
repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

OK, you've made a positive contribution right there, only two weeks out of
the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote
call, or getting help to someone stranded in a flood or earthquake, is on
the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club
or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings
about ham radio? If not yourself, maybe someone from your radio club is not
uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of
us were looking for. I unfortunately, between work and running code practice
for the club and helping out with the VE team have plenty to do. If I had
about three more nights per week, I'd like to seek out new life and new
civi-... oops... new organizations that need programs and present to Lion's
Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire
Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what
rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a
firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and
if you can do a favor for a friend or a stranger, let 'em know it was a
HAM who did it!

RTTY DX Notes, 1of3, 6/22/90

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU.

>and a bit from the neighbors'. The horizontal oscillator operates at
>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the last time you did something original ? If you have a better, cheaper, faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an uneditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona
claims they can "squeeze a full-blown HDTV signal and a conventional
NTSC signal within the same 6 MHz frequency channel" by using "a new
modulation technology to add information to the spectrum without inter-
ference."

Richard Gerdes, PSI co-founder, explains that their technique "alters
the shape of the carrier and transmits the result of that altered wave

shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation
for NTSC broadcasts: an encoder and decoder that allows an NTSC station
to broadcast two channels simultaneously from one transmitter. "You
could tune to channel 4A or 4B using the decoder," Gerdes says. The
FCC has already granted an experimental license for channel 11 in Tuscon,
a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on
waveform modulation; PSI's technology? And does WM have implications
for other EM-based communications?

> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or
about 2 S-units. A good antenna in a good QTH can make much more of a
difference. The difference between someone that the gods of propagation are
smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They
said that I was the only W/K station that they could hear. This was not due
to monster antennas or high power. It was mostly the dumb luck of being
exactly where the opening was. Sill, it was great to be the target of a
pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big
deal. I have about 125 confirmed countries. Almost all of them came back on
the first or second call and QSL via the buro. After all, ham radio should be
fun. If you are not having fun do something else.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED
AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268
SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE
23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER
LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER
THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS
PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT
18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK,
EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT
TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE
TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT
MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY.
IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND
125 WITH A MEAN OF 95.4. AR

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775
region, and most of them do not require a tone burst to start them up. The
offset is as in the US, -600 Kc for the input frequency. On 70cm most of

the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift
for the input frequency. Remember the bandplan is a lot smaller in Holland
for 2m and 70cm as it is in the US, but you can easaly find that your
reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess
they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement,
but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think,
you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted
before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance
too.

Hope to hear you.

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance
is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to

a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast them locally.)

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be
difficult to implement. PC's are nice because most of the hard work that
would normally have to be done in hardware in a non-CPU based repeater
can be done in software. Access codes can be easily changed, PROMS
don't have to be burned for different CW ID's, the ID's themselves can
be generated by the computer, etc. The way I see it, the above caveat
can easily be remedied by not using floppy drives/a hard drive in normal
operation. The system should be set up so that upon booting, both the
control software and all data necessary to run the repeater, including
the custom control codes, ID's, messages, etc. should all be loaded into
memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted
to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly
communicate with the computer byte-wise. Control lines on the RS232 port
make handy binary lines. Having the computer set lines high is a quick
and efficient way of flipping relays, keying CW, etc. They can be used
as input as well - have a receiver set the line high when a signal
opens squelch. It's a lot easier than having to read and write 8 bits
on the data lines and allows for more than one device to be connected
to the computer unlike 2-device serial communications. And if one
port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost
less than $500 new, probably under $300 used. If money is really
tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be
getting DTMF tones from the receiver to the computer. That shouldn't be
all that difficult either. Less than 5 chips in actuality. Take
a DTMF decoder and a UART and you're 99% done. Things like detecting
S/N for voting or detecting PL might be a bit more difficult, but they would
be necessary in a non-computer-based repeater anyway. Control of the
repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

>We'd have *alot* more room on our bands if people used directional antennas
>and ran reduced power. The latter would force the fomer somewhat.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

>
OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire

Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT,
VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster.
Thank you all for your assistance. Every little bit helps.

EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the
callsign of AN9CI. The call was changed at the last moment, but it
was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux)
on June 23/24. They will operate all bands and modes (including CW on
10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but
propagation has been very poor, and someone has taken Africa off the
map.

GL DE DX1 (VK2EG) VIA TG9VT.

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,
faster way to do something and don't publish, it's as if you never
thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power
(tube) RF amps. Does one already exist ? I don't know - I haven't seen
one yet.

By the way, I find this newsgroup to be a powerful counter point to the
regular mags. We can say what we want against CQ and QST in an uneditted
manner. We can also exchange ideas in a way not possible via a magazine.
I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the
formula that made them successful. The magazine appealed to

the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a
great mix of electrical engineering, amateur radio, general
electronics hobbyist stuff, basic theory and pseudo-science.
The downside is 1) ads are for UK products 2) prices are
in pounds 3) words like color are spelled 'colour' 4) expensive
in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona
claims they can "squeeze a full-blown HDTV signal and a conventional
NTSC signal within the same 6 MHz frequency channel" by using "a new
modulation technology to add information to the spectrum without inter-
ference."

Richard Gerdes, PSI co-founder, explains that their technique "alters
the shape of the carrier and transmits the result of that altered wave
shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation
for NTSC broadcasts: an encoder and decoder that allows an NTSC station
to broadcast two channels simultaneously from one transmitter. "You
could tune to channel 4A or 4B using the decoder," Gerdes says. The
FCC has already granted an experimental license for channel 11 in Tuscon,
a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on
waveform modulation; PSI's technology? And does WM have implications
for other EM-based communications?

> not only 59+ but louder than some fellows who told him they
> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

73,
Bob

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED
AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268

SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

WB8ELK's BALLOON Launch carrying LIVE ATV is going on as scheduled. The launch net will be on 40 meters LSB 7155 KHz. "CAP COMM" will be WA3USG. Net will commence at 8:30 AM EDT with launch expected at 9:00 AM EDT. Video will be on 439.25 (CABLE CH 60). Beacon frequency 144.34.

Bill (WB8ELK) is inviting everyone out to the launch sight to view the launch. Bill is also in need of some people with FOX HUNTING skills to help with the recovery. If you can help please contact him direct at 73 Mag Phone: 603-525-4201.

If you view the video or hear the beacon please get in touch with Bill. He will certainly want to get reception reports.

>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775 region, and most of them do not require a tone burst to start them up. The offset is as in the US, -600 Kc for the input frequency. On 70cm most of the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift for the input frequency. Remember the bandplan is a lot smaller in Holland for 2m and 70cm as it is in the US, but you can easaly find that your reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement, but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think, you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450
9700 AL Groningen
The Netherlands.

Include to speed up the procedure, copies of your US licenses. As noted before, you might have to pay for your license(s)!

>Please reply via email, if possible.

Why personaly, I think it could be of interest for a wider audiance too.

Hope to hear you.

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_,
W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths
in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With
copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance
is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad.
The horizontal radiation pattern (free space) is only slightly inferior to
a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line
aren't considered in this. But it still indicates that small loops *might*
work pretty well. Whether the AEA job does or not is still an open question.
Hopefully, someone out there will actually TEST one and let the rest of us
know.

Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be
a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries
to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be

bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that
fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast
them locally.)

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be
difficult to implement. PC's are nice because most of the hard work that
would normally have to be done in hardware in a non-CPU based repeater
can be done in software. Access codes can be easily changed, PROMS
don't have to be burned for different CW ID's, the ID's themselves can
be generated by the computer, etc. The way I see it, the above caveat
can easily be remedied by not using floppy drives/a hard drive in normal
operation. The system should be set up so that upon booting, both the
control software and all data necessary to run the repeater, including
the custom control codes, ID's, messages, etc. should all be loaded into
memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted
to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly
communicate with the computer byte-wise. Control lines on the RS232 port
make handy binary lines. Having the computer set lines high is a quick
and efficient way of flipping relays, keying CW, etc. They can be used
as input as well - have a receiver set the line high when a signal
opens squelch. It's a lot easier than having to read and write 8 bits
on the data lines and allows for more than one device to be connected
to the computer unlike 2-device serial communications. And if one
port isn't enough, another serial port can be added for about $25.
A stripped-down single-floppy XT clone with 2 serial ports should cost
less than $500 new, probably under $300 used. If money is really

tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be
getting DTMF tones from the receiver to the computer. That shouldn't be
all that difficult either. Less than 5 chips in actuality. Take
a DTMF decoder and a UART and you're 99% done. Things like detecting
S/N for voting or detecting PL might be a bit more difficult, but they would
be necessary in a non-computer-based repeater anyway. Control of the
repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd
be interested in hearing how you went about the whole project. I'm
sure it's been done many other times before, but it would still
be interesting.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have decided not to renew it. (We are an ARRL-affiliated club, by the way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says, "Let's have fun and build a 20-meter cw portable tranceiver that works on a 9-volt battery!" SOOOOO many times - this is the sort of thing that belongs in the handbook, and not to pop up in QEX two or three times a year.

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

RTTY DX Notes for Weekending 22nd June 1990.
Part 3 of 3.
BID: $RTDX0624

Wednesday 20:
LY2WW 21083 at 0235Z
RA3AL 14097 at 0345Z
EA6MQ 14097 at 0518Z QSL
KL7KJ 14087 at 0522Z
VR6WH 14089 at 0635Z
PJ2MI 14074 at 1040Z ARQ
ES2WX 14084 at 1153Z

UA9EAL 14085 at 1352Z
BV4VB 21088 at 1745Z
PZ1DZ 14084 at 2338Z

Thursday 21:
UQ2HO 14089 at 0348Z
J73EH 14082 at 0440Z
EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.
/EX

>15.734 KHz.

Yeah, I get this one, too. Lessee - 30 Mhz is on about the 2000th
harmonic. That's a sharp sawtooth indeed ! Can I put a ferrite bead
on a wire somewhere in the telly to get rid of this ?

My wife finds it ironic she QRMs me as much as I QRM her. :-)

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,
faster way to do something and don't publish, it's as if you never
thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power
(tube) RF amps. Does one already exist ? I don't know - I haven't seen
one yet.

By the way, I find this newsgroup to be a powerful counter point to the
regular mags. We can say what we want against CQ and QST in an uneditted
manner. We can also exchange ideas in a way not possible via a magazine.
I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the
formula that made them successful. The magazine appealed to
the more technical portion of the amateur radio population.
About three or four years ago, I think they forgot this fact
and started watering down their technical content. I had written
a couple of articles for them and conversations with their
editors began to center more on sure fire idiot proof construction
and less on technical content (IMHO).
At that point I pulled the plug on my subscription,
so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a
great mix of electrical engineering, amateur radio, general
electronics hobbyist stuff, basic theory and pseudo-science.
The downside is 1) ads are for UK products 2) prices are
in pounds 3) words like color are spelled 'colour' 4) expensive
in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona
claims they can "squeeze a full-blown HDTV signal and a conventional
NTSC signal within the same 6 MHz frequency channel" by using "a new
modulation technology to add information to the spectrum without inter-
ference."

Richard Gerdes, PSI co-founder, explains that their technique "alters
the shape of the carrier and transmits the result of that altered wave
shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation
for NTSC broadcasts: an encoder and decoder that allows an NTSC station
to broadcast two channels simultaneously from one transmitter. "You
could tune to channel 4A or 4B using the decoder," Gerdes says. The
FCC has already granted an experimental license for channel 11 in Tuscon,
a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on
waveform modulation; PSI's technology? And does WM have implications
for other EM-based communications?

> I was running a Uniden 2510 with no amp and told me I was
> not only 59+ but louder than some fellows who told him they
> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or about 2 S-units. A good antenna in a good QTH can make much more of a difference. The difference between someone that the gods of propagation are smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They said that I was the only W/K station that they could hear. This was not due to monster antennas or high power. It was mostly the dumb luck of being exactly where the opening was. Sill, it was great to be the target of a pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big deal. I have about 125 confirmed countries. Almost all of them came back on the first or second call and QSL via the buro. After all, ham radio should be fun. If you are not having fun do something else.

The item called an OCTOPUS can actually have two applications. In the first case it is totally legal, it is an old term for a power cord. The illegal version is an interlock system which enables a team with multipul transmitters to abide by the rule which prohibits a single transmitter team from transmitting on more than one transmitter at a time. The interlock works like this:

The transmit buttons are all interlocked such that the first station pushing a transmit button locks out all others from transmitting until he releases his button. When he is finished then the nest request is honored. Often these have an override function which enables a station to transmit until he explicitly releases the lockout. This is by ARRL FD rules totally illegal as not complying with the spirit of the definition of single transmitter class. The concept could be expanded to several transmitter setups but would be equally illegal.

>
>It seems like a lot of money to me to tie up in a controller.

A group of local amateurs led by N4CLA has developed a controller based
on a plugin board for the PC. It digitizes the receiver output, processes
it, and converts it back to analog for the transmitter. It is roughly
a DSP system with shared dual ported memory that allows voice mail,
a dynamic voice detection type squelch, touchtone detection and generation,
and over 200 commands. It will work in any PC, even the original IBM
PC1, and it can be used without the PC if you don't need voice mail.

They have installed it on two repeaters so far and plan to introduce
it commercially at the upcoming Atlanta Hamfest. It is a very flexible
system with very high quality audio.

I am of the school that says "two wires make a light" and don't feel
the need to have such a powerful controller. However for those who
feel the need, this thing is a technical marvel.

Maybe one slightly different tack is to approach the TEACHERS, make resources
and training availble to them, and offer to assist with transferring it to
the students.

I get the impression a lot of teachers feel tied up with budget constraints
and administrative policy.

If you can get one teacher interested in ham radio, that might lead to getting
a dozen students involved...

Just a thought!!

ZCZC AP30
PROPAGATION FORECAST BULLETIN 26 ARLPP026
FROM ED TILTON, W1HDQ
SPRING HILL FL JUNE 25, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS OFF TO A GOOD START EARLY IN JUNE, BUT IT PEAKED AT 217 ON THE 12TH. THIS WAS 51 POINTS BELOW THE YEARS HIGH OF 268 SET ONE MONTH EARLIER. THE SOLAR FLUX THEN SLID BACK TO 133 BY THE 23RD. IT ROSE A BIT ON THE 24TH AND IT MAY BE ON ITS WAY TO HIGHER LEVELS THIS WEEK.

SOME NEW ACTIVITY WAS SEEN IN THE EASTERN PORTION OF THE SUN OVER THE WEEKEND, AND MORE MAY BE SHOWING UP IN THE NEXT FEW DAYS. ITS PROGRESS CAN BE FOLLOWED BY LISTENING TO INFORMATION GIVEN BY WWV AT 18 MINUTES AFTER EACH HOUR.

DESPITE THE LOW SOLAR FLUX, PROPAGATION WAS FAIRLY GOOD LAST WEEK, EXCEPT THAT BANDS ABOVE 21 MHZ MAY HAVE BEEN MARGINAL FOR DX USE AT TIMES WHEN SPORADIC E SKIP WAS IN. IT MAY HAVE BEEN MUCH OF THE TIME AND IT WILL BE WITH US OFTEN WELL INTO JULY, AT LEAST.

E SKIP IS USEFUL FOR MEDIUM DISTANCE WORK ON 28 AND 50 MHZ, AND IT MAY SHOW UP ON 144 MHZ AT TIMES, ESPECIALLY IN JUNE AND EARLY JULY. IT IS LIKELY TO BE VERY ERRATIC AND SHORT LIVED ON 144 MHZ.

AMERICAN SUNSPOT NUMBERS FOR JUNE 14 THROUGH 20 WERE BETWEEN 67 AND 125 WITH A MEAN OF 95.4. AR

>and or mobile transceiver with us. (ICOM-IC24AT and 3210, USA models)
>We would like to use them to meet local hams, as well as for travel advice.
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

The repeaters in Holland are all located in the 145.6 - 145.775
region, and most of them do not require a tone burst to start them up. The
offset is as in the US, -600 Kc for the input frequency. On 70cm most of
the repeaters are in the 430.000 - 430.500 region, requiring a +1.6Mc shift
for the input frequency. Remember the bandplan is a lot smaller in Holland
for 2m and 70cm as it is in the US, but you can easaly find that your
reciprocal license (I guess).

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?

When I was over in the US, I noticed no big differences, so I guess
they are the same.

>Can we obtain directories of repeaters, before we leave home.

It'll be probably (again) in your receprocal license agreement,
but if not, I'm quite willing to help you out.

>What is the required procedure for reciprocal operating privileges?

As I did for Canada and the US, request one. The address, I think,
you can use for Holland is:

HDTP/ Directie Operationele Zaken
Postbus 450

Subject: Dubious quality of CQ review of AEA IsoLoop
To: info-hams@ucsd.edu

In article <42200@apple.Apple.COM> kchen@Apple.COM (Kok Chen) writes:
>Theoretical arguments against small antennas are very compelling. (The

Well, I dunno. One of my antenna references (_Antenna Theory and Design_, W. Stutzman, G. Thiele) does an analysis of a circular loop 0.2 wavelengths in circumference at 1 MHz. The calculated impedance is 0.316+j285.8. With copper wire with a conductivity of 5.7E-07 mhos/m, the total input resistance is calculated at 0.324 ohms. This yields an efficiency of 97.5%. Not bad. The horizontal radiation pattern (free space) is only slightly inferior to a dipole in its most favored direction. Again, not bad.

Of course, losses in any network used for matching to the transmission line aren't considered in this. But it still indicates that small loops *might* work pretty well. Whether the AEA job does or not is still an open question. Hopefully, someone out there will actually TEST one and let the rest of us know.

>
Ah hah! Another fan of good bad movies! I think it was called "Dangerous
Rescue." It was produced by Zarkoff. We (Jim Blakey and I) use our own
rating scheme:

good/good : Star Wars, Die Hard, etc. A movie that tries to be
a good movie and succeeds.
bad/good : Out Of Africa (IMHO), Star Trek V. A movie that tries
to be a good movie and fails.
good/bad : Toxic Avenger, Killer Klowns. A movie intended to be
bad that succeeds.
bad/bad : Toxic Avenger II, etc. A movie intended to be bad that
fails. These are the most painful to watch.
See ya at the bad movies! (too bad I can't use my ATV setup to broadcast
them locally.)

Subject: Homebrew repeater controllers
To: info-hams@ucsd.edu

In article <7880166@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Just a word of caution - disk drives are less rugged than most electronics.
>If the controller spends most of it's time in an air-conditioned shack, it
>should be fine. :-)
>
>Perry Scott

IMHO, using a PC as a repeater controller is a good idea, and shouldn't be
difficult to implement. PC's are nice because most of the hard work that
would normally have to be done in hardware in a non-CPU based repeater
can be done in software. Access codes can be easily changed, PROMS
don't have to be burned for different CW ID's, the ID's themselves can
be generated by the computer, etc. The way I see it, the above caveat
can easily be remedied by not using floppy drives/a hard drive in normal
operation. The system should be set up so that upon booting, both the
control software and all data necessary to run the repeater, including
the custom control codes, ID's, messages, etc. should all be loaded into
memory to prevent unnecessary use of the disk drive and also to increase
speed. But that's probably pretty obvious. I can't think of any real
reason why the computer would have to write anything to disk as the
repeater is used. What's there to be logged that easily be converted
to a digital format that's of any use?

BTW, most of the interfacing can probably be done without having to directly communicate with the computer byte-wise. Control lines on the RS232 port make handy binary lines. Having the computer set lines high is a quick and efficient way of flipping relays, keying CW, etc. They can be used as input as well - have a receiver set the line high when a signal opens squelch. It's a lot easier than having to read and write 8 bits on the data lines and allows for more than one device to be connected to the computer unlike 2-device serial communications. And if one port isn't enough, another serial port can be added for about $25. A stripped-down single-floppy XT clone with 2 serial ports should cost less than $500 new, probably under $300 used. If money is really tight, use as C64 (ick) or trash-80.

About the only "real" communications that would be necessary would be getting DTMF tones from the receiver to the computer. That shouldn't be all that difficult either. Less than 5 chips in actuality. Take a DTMF decoder and a UART and you're 99% done. Things like detecting S/N for voting or detecting PL might be a bit more difficult, but they would be necessary in a non-computer-based repeater anyway. Control of the repeater would be simple - just tack on a modem.

If you do decide to go through with the project, keep us posted. I'd be interested in hearing how you went about the whole project. I'm sure it's been done many other times before, but it would still be interesting.

>and ran reduced power. The latter would force the fomer somewhat.

It sure would cut down on the round-table QSO's & networks.

Oh, and the mobile operators might think it was a bit of an imposition.

I would think that Kilowatt ops are more likely to have a beam & tower
already. Either they have more money to spend, or are willing to spend
more of what they have on the hobby.

We have a lot more room with most people running SSB rather than AM,
but we didn't have to legislate to accomplish it. People switched for
their own reasons (like more bang for the watt).

Not really. My club just got its renewal notice for QEX and I have
decided not to renew it. (We are an ARRL-affiliated club, by the
way, which has some *teriffic* benefits).

My problem with QEX is redundancy. I have seen an article that says,
"Let's have fun and build a 20-meter cw portable tranceiver that works
on a 9-volt battery!" SOOOOO many times - this is the sort of thing
that belongs in the handbook, and not to pop up in QEX two or three
times a year.

OK, you've made a positive contribution right there, only two weeks out of the mailbox. (Congrats, BTW!)

Anything a ham does for the public, whether its a courtesy phone patch/remote call, or getting help to someone stranded in a flood or earthquake, is on the plus side.

We need all of that we can get. Good show.

Now. Were those folks (since they were up on a mountain...) part of a club or organization (climbing club, environmentalist organization, whatever?)

Is there a way you can arrange for a presentation at one of their meetings about ham radio? If not yourself, maybe someone from your radio club is not uncomfortable in front of a strange group...

SYSMSGSBE-W-WARNING: SOAPBOX MODE ENGAGED...

That's a little more agressive, and I think that is what Patty and some of us were looking for. I unfortunately, between work and running code practice for the club and helping out with the VE team have plenty to do. If I had about three more nights per week, I'd like to seek out new life and new civi-... oops... new organizations that need programs and present to Lion's Club and Elks and Shriner's and Ladies' Auxiliary of the Volunteer Fire Department... and present ham radio as it is (or as we hope it to be!)

Two things are possible if you do that right...
(1) Jane and John Q. Public know FOR REAL what ham radio is, not what rumor and misinformation make of it, and
(2) SOMEBODY might get interested.

(2) is nice, but they're not going to beat your door down. (1) builds a firm foundation on which (2) can build from.

Maybe, maybe not. But it sure can't hurt...if it's done well.

SYSMSGSBE-I-NOTICE: SOAPBOX MODE TERMINATED.

Have fun with your new license. Go try all the neat things you can do, and if you can do a favor for a friend or a stranger, let 'em know it was a HAM who did it!

RTTY DX Notes for Weekending 22nd June 1990.
Part 1 of 3.
BID: $RTDX0622

The ANARTS contest has come and gone, and if you thought that the propagation was poor for that weekend, you should have a look at it now. Even the intruders are missing. But we have received some logs, and from some of the scores there was little to complain about. Keep the logs coming, chaps.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, OD5NG, PJ2MI, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Every little bit helps.

J73EH 14082 at 0440Z
EA6MQ 14088 at 0516Z

QSL Information:

ED9CI says to QSL via EA9KQ.

T5RM will QSL via HB9RTR, 134 Saules, 1233 Bernex, Switzerland.

HK0BKX (San Andres) via WB9NUL.

FY5DG is at Box 450, Kouru, French Guyana.

SU1HN will QSL via Box 1578, Alf Maskan, Cairo.

EA6MQ will QSL via his Callbook address.

Notes of Interest:

ED9CI was the station that was reported last week as having the callsign of AN9CI. The call was changed at the last moment, but it was still Aure on Chafarinas Island.

YL1WW is in Riga, USSR. No further information at this time.

TV9GIR will be a special call from Margaux Island (north of Bordeaux) on June 23/24. They will operate all bands and modes (including CW on 10 MHz). QSL via FD1MRE or via the bureau.

We appear to be a little short of information this week, but propagation has been very poor, and someone has taken Africa off the map.

GL DE DX1 (VK2EG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

I agree. Magazines don't dream up this stuff - we do. When was the
last time you did something original ? If you have a better, cheaper,

faster way to do something and don't publish, it's as if you never thought of it at all.

What about me ? I'm working on a cheaper soft-start for high-power (tube) RF amps. Does one already exist ? I don't know - I haven't seen one yet.

By the way, I find this newsgroup to be a powerful counter point to the regular mags. We can say what we want against CQ and QST in an unedditted manner. We can also exchange ideas in a way not possible via a magazine. I even find technically useful information, despite the lack of graphics.

Re: Goodbye Ham Radio Magazine

* I said goodbye to HR some time ago. I feel that they lost the formula that made them successful. The magazine appealed to the more technical portion of the amateur radio population. About three or four years ago, I think they forgot this fact and started watering down their technical content. I had written a couple of articles for them and conversations with their editors began to center more on sure fire idiot proof construction and less on technical content (IMHO).
At that point I pulled the plug on my subscription, so I have no recent experience with HR.

* Wireless World is a really interesting magazine. It has a great mix of electrical engineering, amateur radio, general electronics hobbyist stuff, basic theory and pseudo-science. The downside is 1) ads are for UK products 2) prices are in pounds 3) words like color are spelled 'colour' 4) expensive in the US.

Subject: HDTV and Waveform Modulation
To: info-hams@ucsd.edu

A new term to add to the HDTV glossary, waveform modulation is given
a brief mention in the July 1990 issue of _Video_Magazine_, page 50.

According to the article, Production Services, Inc. of Tuscon, Arizona
claims they can "squeeze a full-blown HDTV signal and a conventional
NTSC signal within the same 6 MHz frequency channel" by using "a new
modulation technology to add information to the spectrum without inter-
ference."

Richard Gerdes, PSI co-founder, explains that their technique "alters
the shape of the carrier and transmits the result of that altered wave
shape."

At the NTSC level:

PSI gas already developed a commercial product using waveform modulation
for NTSC broadcasts: an encoder and decoder that allows an NTSC station
to broadcast two channels simultaneously from one transmitter. "You
could tune to channel 4A or 4B using the decoder," Gerdes says. The
FCC has already granted an experimental license for channel 11 in Tuscon,
a Fox Network affiliate, to begin testing the system.

Article aside, has anyone in Tuscon seen this? Any elaborations on
waveform modulation; PSI's technology? And does WM have implications
for other EM-based communications?

> I was running a Uniden 2510 with no amp and told me I was
> not only 59+ but louder than some fellows who told him they
> were running about 1 KW! Made me feel just *fine*.

That is correct. The difference between 20 watts and 1000 watts is 13 db or
about 2 S-units. A good antenna in a good QTH can make much more of a
difference. The difference between someone that the gods of propagation are
smiling on and someone that they are not can be 60 db or more.

I remember on night working about 50 east european stations in a row. They
said that I was the only W/K station that they could hear. This was not due
to monster antennas or high power. It was mostly the dumb luck of being
exactly where the opening was. Sill, it was great to be the target of a
pileup for once.

P.S. My attitude to DXCC is, if I happen to work them great, if not, no big
deal. I have about 125 confirmed countries. Almost all of them came back on
the first or second call and QSL via the buro. After all, ham radio should be
fun. If you are not having fun do something else.

I know it takes a lot more letters but why not write to the advertizers??
A few well composed suggestions to some of the bigger advertizers might
just put some pressure where it might do some good. That coupled with
reduced subscription lists ?could? have an effect. CQ Used (c 1945-1970)
to be a reasonable good rag. I still think we should push for a quarterly
tech journal along the lines of what HR used to be (and 73 also before
Wayne lost a fair amount of his common sense). A quarterly couldn't put
too much burden to the publishing buisness, they would have the ability
to select really prime tech stuff and put out a good quality mag, something
with less half-tone and a darned sight less glitz.

Hmm. I thought that, once you transmitted on a band, you had to stay
on that band for at least 15 minutes.

One thing I did when I became SM of Utah in '83 was to have some buisness cards printed up with the ARRL logo in red (the SM color). Besides handing these out at club meetings and ham fests I also used them whenever I lent a hand to an organization or an individual. Stopping by the road to help a stranded motorist call for assistance or ringing up a patch during a race I always indicated that I was a RADIO HAM not a CB, I then gave them one of my cards and made a short statment that we were always glad to help out.

3756. Rumor of V31BB's death

Newsgroup: rec.ham-radio
Date: 1990-06-26 15:14:02 UTC
From: pswecker@uncmed.med.unc.edu
Message-ID: <436@beguine.UUCP>
Source record: 10756

I have only heard this third hand, but rumor has it that Jim, V31BB, has died in Belize. For those unfamiliar with him, he was probably best known as the voice of the MFJ junk net, which was a nice platform for him to expound on the evils of buying equipment from the MFJ corp.

Having only spoken to him once, but having listened to V31BB alot, this rumor is going to need lots of checking before it can truly be believed. One story is that his death was due to electric shock while working on his amplifier.

If anyone knows any more about this, please give us the info!

3759. ICOM IC24AT command summary

Newsgroup: rec.ham-radio
Date: 1990-06-26 15:56:55 UTC
From: rbono@necis.UUCP
Message-ID: <1347@necis.UUCP>
Source record: 10768

I have noticed that many on the net seem to be interested in the new ICOM series of hand held radios, and have received many email requests for futher information, therefore I thought you (the net) may be interested in the following information that KC1IY and myself put together...

```
*******************************************************************************
*******************************************************************************
** ICOM IC24AT keyboard command summary **
** Copyright (c) 1990 **
** KC1IY and NM1D **
** Revision 1.1 **
** Distribution allowed if this notice is included in its entirety **
*******************************************************************************
*******************************************************************************
```

This is an attempt to document all of the known key sequences for the ICOM IC24AT (144/440MHz dual band hand held). Some key sequences may be common with the IC[2,3,4]SAT, therefore a few key sequences for those radios are also on this list. Some key sequences require options (such as the PL encode/decode board).

This is not designed to replace the owners manual, but to summarize the information in one place.

Note: Many controls vary depending on the current mode, i.e.: Scan up/down will search frequencies when in VFO mode, and will scan memory channels when in Memory mode. Consult the owners guide for complete information.

```
KEY/COMBINATION = Result, action
--------------- ------------------------------------------------------------
0-9,A,B,C,D,#,* = note: when transmitting these will generate DTMF tones
0-9 = Enter frequency (can also use the VFO knob)
A = VFO mode / clear incomplete entry
B = Memory mode
C = VHF / UHF change
D = Call channel
* = Step frequency down/scan down
# = Step frequency up/scan up
MONI = Open squelch and change to input frequency (if not simplex)
while button is depressed
H/L/DTMF = Select High/Low power, or (while transmitting) send
preprogrammed DTMF codes

FUNC + 0 = Dial set
FUNC + 1 = PL enable (when option is installed)
FUNC + 2 = Code squelch [NOT for the IC24AT, IC[2,3,4]SAT option only]
```

FUNC + 3 = Skip memory
FUNC + 4 = Duplex operation
FUNC + 5 = Code [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 6 = Mask frequency
FUNC + 7 = Priority mode on/off (operation dependent on current mode)
FUNC + 8 = Set mode (several different functions, press A to exit)
FUNC + 9 = Real time clock and timer functions (press PTT to exit)
FUNC + A = Memory to VFO transfer
FUNC + B = Memory Write
FUNC + C = Split operation (cross band full duplex)
FUNC + D = Lock mode / Cross Band Repeat disable
FUNC + * = Scan programmed limits (down)
FUNC + # = Scan programmed limits (up)
FUNC + 5 + D = Cross Band Repeat enable (split mode must be on!)
Diode D14 (right diode on CPU board) must be removed to
enable the use of this function)
FUNC + MONI = RX/TX light enable / disable
FUNC + H/L/DTMF = Select DTMF Autodialer memory
Func + VFO knob = Change frequency/memory channel
(according to dial set, see FUNC+0)
Func + LIGHT = Lock light on (don't time out)

H/L/DTMF + VFO knob = Change output power (4 power levels when using 13.8 vdc)

The following key combinations selects "power on modes". Start with the radio
OFF, then hold down the indicated keys, and continue to hold them while turning
the power ON. Some 'modes' override others.

LIGHT + * = PTT enable
LIGHT + 0 = PTT Disabled (inhibits the transmitter, good security method)
LIGHT + 1 = 1 MHz digit set (4 digit frequency entry)
LIGHT + 2 = 10 MHz digit set (5 digit frequency entry)
LIGHT + 3 = 100 MHz digit set (6 digit frequency entry)
LIGHT + 4 = Scan pause until signal disappears
LIGHT + 5 = Scan pause for 10 seconds
LIGHT + 6 = ???? Unknown action
LIGHT + 7 = Power Save deactivated (use this for packet operation)
LIGHT + 8 = Power Save (minimum - 0.125 / 0.5 second)
LIGHT + 9 = Power Save (maximum - 0.125 / 2.0 seconds)
LIGHT + A = ???? Unknown action
LIGHT + B = ???? Unknown action
LIGHT + C = ???? Unknown action
LIGHT + D = ???? Unknown action
LIGHT + # = ???? Unknown action
LIGHT + B + # = RX Extended Range enable
This requires that diode D13 is removed (left diode on
CPU board). Note that this diode has already been removed
by ICOM at the factory on many units. Be sure to hold
these keys down until the activity display stops and is
showing a receive frequency.

FUNC + A = Reset the CPU (this will clear all the memory channels to the factory defaults)

If you have any corrections or additions, please send them to uucp:rbono@necis.nec.com or packet:NM1D@WB1DSW.

>

How about a wide-band/packet approach... digitize and send the blocks to rptr.
assume the rotation speed of the antennas (2 will be needed, similar
to a radar scanner I have in the basement at the moment) is 30 rpm, continuous.
Digitize your voice into .5 second segments at 3K sps (12 K samples per
rotation). Transmit the last 8 segments at 500K to 1M bps to the repeater,
and hopefully, it can receive and interleave your packets with everyone elses,
transmitting all of them for the next 2 rotations (oldest get dropped).
You receive these packets and reconstruct the audio. Limited full duplex
with the problems of missed packets, of course.
Transmit only when you hear the repeater spewing packets.
A small bit-slice machine should be able to keep up doing the packet
reassembly.

Is Roger (VE3RKS) in on this? Say hi for me.

Radio shack has informed me that they have discontinued the SSI2102 touch tone decoder IC from the retail line. They could not tell me whether or not the part would be available on order.

It may be worthwhile for all hams to comb the local radio shack's now, as any that are still left in stock will probably be half price ($5-6 range).

Unfortunately, these chips are not easy to come by ... DTMF decoders are not listed by Digikey, JDR Microdevices, Jameco, or any of the other "standby's". The alternative - building DTMF decoders out of eight (seven if you don't care about ABCD tones) 567's - is messy and a pain in the neck to align properly.

3764. cw rig recommendation

Newsgroup: rec.ham-radio
Date: 1990-06-26 17:58:02 UTC
From: eric@iodine.cchem.berkeley.edu
Message-ID: <1990Jun26.175802.12879@agate.berkeley.edu>
Source record: 10763

Howdy Folks!!

I have just discovered this newsgroup and it has prompted me to ask a few questions about rigs for cw. I have been inactive for about 10 years now due to school (college and grad school), and since an end of school isn't in sight, I figured that I would try to get back into hamming and not wait. I am most interested in cw, sort of a purist perhaps. Looking at the rigs over the past years and with the addition and implementations of the new bands from WARC '79 has made me desire a new rig.

My old (and I think still working) rig is a Heathkit HW101 from about '73 I think. It has 80, 40, 20, 15, and 10 meters on it. The only controls are the rf, af, filter, and tuning knobs (final amp and VFO). It sort of makes me laugh comparing it to what is available now. The receiver has a 0.36 microvolt sensitivity I seem to recall.

Now the questions. What, if any, of the new bells and whistles are really useful to the cw op (I do use SSB at times too.). RIT seems handy, as does the notch filter. Does
variable passband and those sorts of controls help? I would like to have full break-in. What are the memories used for? Are they mostly for the general coverage mode of usage?

Lastly, what rigs would you recommend and why? I seem to recall that things like the Drake CR-7 were good, but they don't seem to exist anymore.
What if I reask this
question with the stipulation that the price be less than $1000. What could I sell the HW101 for?

Thanks for your help!!

> is a membership organization, not just a magazine, be this openly critical?
> Probably not. Ham radio sorely needs a Consumer Reports type of organization,

Anyone recall the critical review that QST gave of the MFJ Multi-Mode
Data Controller/TNC? MFJ got pissed, and made enough noise that QST
agreed to do ANOTHER review, this time of a MODIFIED unit! Of course,
in the end it had a good effect, because the same mods were allegedly
done to the production units as well....but somehow I can't imagine
Consumer Reports following up a scathing review with a more friendly
one, following acceptance of a modified product from the manufacturer!

Then there was the great review of the bogus "automatic" antenna tuner,
that achieved low SWR with big RESISTORS in the circuit....

3769. The mess on 20 meters

Newsgroup: rec.ham-radio
Date: 1990-06-26 18:36:39 UTC
From: sorgatz@ttidcb.tti.com
Message-ID: <18128@ttidca.TTI.COM>
Source record: 10685

In listening to the 20 meter band circus I've noticed that there are 3
problem areas:

1) The small number of American Amateur Extras that have taken it upon
themselves to dictate/interpret the FCC rules to the other stations/
operators on the band. All of these jerks that I've heard have been
in 4 or 5 land. Looking up their calls and relating their mailing
address with a position on my map, I find none of them to be in
remote or inaccessable areas - why isn't the Auxillary or ARRL
pink-ticketing these individuals?

2) The large number of Spanish-speaking stations that seem hell-bent
on doing nothing but jamming the DX parties. These stations never
id, nor do they seem to be active in seeking contacts, or conversing
amongst themselves. Most of the signals are between S9 and 40+ over S9..
..I wonder where they are? Perhaps an inquiry with the diplomat kids...

3) The fact that the ARRL, the FCC and the Amateur Community is unwilling
to take on these sour-note clowns head-on. Everyone keeps ignoring the
obvious! Get 'em on tape, send the pink-tickets - if they keep it up,
bust 'em! Just get a Fed Judge to issue a warrent, get a Fed Marshall
(with riot gun!) to accompany the FCC Field Engineer and go serve up
the warrent. Put their stupid little asses in the clink! Is that so
damn difficult?! The FCC does this about 4 times a year to the worst
of the CB bad-boys..why not the jerks on 20?

According to kd2bd@ka2qhd.UUCP (John Magliacane):
>Fuji-OSCAR-12 has been heard on recent occasions by G3IOR, G3CAG and G4CUO.
>The spacecraft is apparently receiving enough sunlight to produce a weak
>battery charging current and support low-power transponder and beacon
>operations. FO-12 was switched off by telecommand last year, but apparently
>switched back on when it received commands sent to its sucessor, FO-20.

Now, wait a minute.

Does this mean that the commands to the various spacecraft are not all
tagged with destination IDs?

I can imagine what kind of confusion a lack of satellite ID could, and
apparently can, cause. "Retract your solar panels. No, not you --
the one with the bent antenna. Yeah, you." :-)

Since the chip is made by SSI, I'd imagine that some of the better distributors
that carry SSI components would still have them. If not, there are lot
of companies that make DTMF decoders for the sole purpose of repeater
control. They can't be all that expensive. With the expanding use of
DTMF for controlling devices like phone answering machines or even
BSR remote control power switches, they should still be pretty easy to
find. I have a couple of the SSI chips from Radio Shack and for $7.77,
which is what I paid, you can't beat the deal. If you can still find
them, grab a few. They are definately worth it.

Just picked up the latest issue of '73 after being somewhat disappointed with my gratuitous copy of CQ - and besides, '73 was focused on DF which I find interesting.

In an editorial or publisher's note, the '73 folk said they planned to help make up for the demise of HR with more technical content. Anyone want to review the latest '73?

Mark!

You are a hot-out-of-the-gate engineer (didn't you say communications
technology?) with what should be cutting-edge awareness of what's out there
in the "high-tech" world.

What would it take for YOU, YES, YOU! to write an article for such a
publication (be it QST or QEX or HAM RADIO-if-it-were-resurrected, whatever)
on some topic of interest to amateurs?

Do it!

Convince yourself that nobody else is gonna do it.

Then do it.

THAT is what it takes. Not "somebody oughta..." but "I will...".

Seriously.

I'm not kidding, :-)'ing, flaming, or being sarcastic.

REALLY!

>should be fine. :-)
>
>Perry Scott

Some real world experience. We have been using PCs for packet switches
on mountain tops for over two years. Hard disk drives have been the
MOST reliable part of our installations. Of course we are using old
5 to 10 megabyte clunkers that have broad tracks and loose tolerances,
but we have had absolutely zero failures in unconditioned radio huts.
What does fail is the floppy drive. The diskette disintigrates in
summer with the oxide peeling off and plating onto the heads. In
winter the diskette gets so brittle that it fails. So don't leave
a diskette at the site if you want it to survive.

>A new term to add to the HDTV glossary, waveform modulation is given
>a brief mention in the July 1990 issue of _Video_Magazine_, page 50.
>
>Richard Gerdes, PSI co-founder, explains that their technique "alters
>the shape of the carrier and transmits the result of that altered wave
>shape."

This is called "modulation" and is what all transmitters do to convey intelligence on a carrier.

>At the NTSC level:
>
> PSI gas already developed a commercial product using waveform modulation
> for NTSC broadcasts: an encoder and decoder that allows an NTSC station
> to broadcast two channels simultaneously from one transmitter. "You
> could tune to channel 4A or 4B using the decoder," Gerdes says. The
> FCC has already granted an experimental license for channel 11 in Tuscon,
> a Fox Network affiliate, to begin testing the system.
>

This technology is not new and has been used on satellite video channels for several years. Basically what they do is break apart two NTSC pictures and use field one from one picture and field two from the other. They then reverse the field sequence for the next frame. Then at the receiving end they use two framestores and a demultiplexer to reconstruct the two video signals. As you can tell from the description, they throw away half of each video frame. This causes some loss of vertical resolution (though they do frame to frame interpolation which recovers most of the resolution for stationary pictures). The resulting artifacts are most noticable on rapidly moving video.

One thing video freaks should know is that broadcasters have expressed a serious lack of interest in HDTV. In fact the use of minicams and small format tape has markedly reduced the quality of ordinary NTSC video being broadcast by networks and affiliates. The over the air broadcaster has seen a decline in viewership in the last several years due to low quality VCRs and poor quality NTSC cable channels being preferred by the average viewer. The broadcaster has responded by cutting costs to the bone by using cheaper equipment and reducing the technical requirements for his staff. It is estimated that it will cost over $50 million to changeover a broadcast plant to HDTV. With no market (no receivers in place) and the loss of NTSC viewers

(estimated $120 billion invested in NTSC infrastructure) the broadcaster would have to have deep pockets indeed to pioneer HDTV. Plus there is no HDTV product available to fill those 24 hours a day.

3778. HR vs CQ magazines - Leaving only 73 Magazine

Newsgroup: rec.ham-radio
Date: 1990-06-26 22:21:41 UTC
From: Hugh_E._Wells.ElSegundo@XEROX.COM
Message-ID: <900626-152508-5672@Xerox>
Source record: 10774

Hi Gang,

Guess we all received a big disappointment upon receiving the latest copy of CQ. Years ago, I took CQ and enjoyed its technical content. Can't believe the change! Judging from the editorial, the magazine will never return to a technical format.

I've taken Ham Radio Magazine since its inception and have provided technical articles to it over the years. It was a fine magazine and I too, suffer the loss.

HR and 73 have been good "technical" friends, but at different levels. I hope 73 continues to survive as it is the only remaining "user" written technical magazine that we have. Hopefully, 73 will begin to publish some of the more technical articles that previously went to HR and now no longer have a home.

It would be my suggestion that subscriptions be pulled from CQ and placed with 73 along with a note indicating the need to pick-up technical articles from former HR authors. At the moment, this course of action may be the only way to save our technical forum. I recognize that it would be difficult for 73 to shift from the current less technical format, but perhaps one or more HR level technical articles in each issue would work out OK.

Re: 200 W maximum, beam antennas

While I agree in principle (the right tool for the job and all that), there are some realities that creep in -

1. Not everyone can erect a beam. High wind is a problem. Phased Omnis take more real estate than I have. There are also those pesky covenants.

2. I can think of many positionings of 2 receiver/transmitter pairs where a beam won't help.

3. It is sometimes necessary to use >200W on 40/80/160 to get over QRN, especially during summer.

4. The use of omnidirectional antennas is appropriate to a roundtable, which is typical of 40/80.

5. Ever see an 80 meter beam on a tower ? I've seen K0RF's. It looks tenuous.

Yes, one can do a lot with antennas. However, it isn't the technology that is the problem, it's the operator. Any power in excess of that required to make the contact is illegal. We already have the laws; where is the enforcement ? Maybe the problem is us - macho signal reports seem to be better than good operating skills.

When was the last time I asked someone to QRP ? I dunno. I'm part of the problem, too. S9+40 is real easy listening.

lewine@dg.dg.com (Don Lewine) claims that...

>>The difference between 20 watts and 1000 watts is 13 db or
>>about 2 S-units.

It's not, it's a factor of 50, which is 17 db, basically 3 S-points.
Face it, if you are called by someone who is S5 and someone who is S8
you are usually going to answer the S8 person. But if the only person
calling you is S5 then you hear and answer them. So yes, you can work
a lot of DX on low power if you know when to keep trying and when to
give up. In a recent contest I lowered the power to 5 watts and worked
all continents (those Big Stations have good antennas and good ops and
they will hear you eventually). But having done that, I admit that I
raised the power again and went searching for new countries.

QRP is fun, but it many cases QRO is funner :-)

I dunno if it's true of the review of the loop antenna thingy discussed here, but a few issues ago there was a review of an HF amplifier in CQ, and an ad for the same thing in that issue as well. I remember noticing that the two were identical in places, as if someone had just reeled off the specs from the ad and called it a review. I remember thinking at the time that this was very poor practise, it was as if the mag had just given the guys selling the amp another page to say the same thing only not head it 'advertisement'. It may have been the same issue as the one with the loop thingy review, if anyone has more energy than I have and wants to go and check.

Interestingly, our Physics-Math-Astronomy library gets CQ Mag, perhaps a previous librarian was a ham. I'd never see it otherwise.

Yes, I have confirmation that he was found in bed on Wednesday morning, June 20th. He was suppose to meet another ham operator on Wednesday morning. When Jim didn't show up, he went looking for him and found him dead in bed. The exact cause of death is unknown at this time. I don't know where the electric shock story came from. I heard that there are a few rumors that are already floating around...this might be one of them.

If you want more information, try to contact KA2RRK (Jerry, Ft. Dix, NJ), on 28.305 USB after 22:00 EDT if the band opens.

I dwouldn't have a problem with lower power limits either. I think
you've missed the mark with the beam requirement, though:
1) The number of hams who can afford towers and beams is small.
2) Many hams can put up wire antennas, but can't put up a beam due to
city zoning rules, deed restrictions, etcetera.
3) What about 40 and 80??

Maybe you need to rethink this one.

Interesting. I've had a packet switch on a mountain top here for about a
year and the floppy hasn't experienced any problems. (One difference is
that I'm using disk drives with head load--the head isn't in contact
with the disk unless it's being used.) On the other hand, it only
accesses the disk to boot up, which it hasn't had to do for about six
months. Hmmm... maybe I had better check the disk that's in there!

Not the whole third world, Julian, just some parts of it that have no ham
radio to speak of. Why? Because by helping to promote ham radio in these
parts of the world we may influence the national administrations of these
countries to be more favorable to ham radio. And in the ITU, each country
has exactly one vote--Zaire's vote counts the same as ours. I don't think
tring to increase international support for ham radio is a waste of the
members' money. Do you? (BTW, this is not the only effort toward this goal.
Although I don't know much about some of the things ARRL is doing in this
area, I do know that every year we bring in 7-10 people who are telecomms
administrators in third-world countries for a class in amateur radio

administration. The class is held at ARRL HQ.)

I think 20m is appropriate technology for the intended purpose and
destination.

If this were the only thing going on at HQ I would agree with your complaint.
But it isn't. And a lot of people _are_ interested in this stuff, even if
you and I aren't. How about a little tolerance for other people's interests?
As for the microwave column, in my opinion good feature articles on microwave
do far more to promote those bands than that column ever did. I always
thought that column preached to the choir; if you weren't already "into"
microwave there wasn't much there for you. Nothing wrong with that if it
were the most effective way of doing it, but I think the feature articles are
better. I dunno all the reasoning why it was dropped, but I can't say I
miss it much. (Explain how 10-GHz DX records are any more relevant than
DXCC, not counting the fact that you personally are interested in one
and not the other.)

> dimensions too.

Agreed. ARRL's microwave book efforts have been beset by problems,
largely having to do with turnover in the editorial staff, but also
because it simply wasn't a high priority item. (Note that this was
within the Tech Department--I'm not talking about policy here.) It
should be out soon, I hear. (I suggested the advertising for it
borrow from the old movie ads: "10 years in the making!" They were not
amused. :-)

On the other hand, what's wrong with ARRL making RSGB books available to
the members? Are we so xenophobic that we shouldn't distribute anything
that doesn't have "made in the USA" printed on it?

> ...about submitting technical articles to QST...

I don't think that the lack of technical articles appearing in QST is due to a lack of submissions. The recent publication of the second volume of the "Antenna Compendium" seems to indicate that QST has a SURPLUS of technical article submissions. I would rather have seen these articles appear in QST in place of the 20 treatises on building QRP SWR meters or 2-position antenna switches that permeate the magazine. QST makes a conscious decision to limit the number of technical articles. They represent the entire amateur community and have to present what they feel to be a balanced menu of articles. Of course, the readers of the UseNet forum are, in general, more technically inclined than the average ham and would like to see more technical articles in QST or anywhere.

In view of the demise of Ham Radio, wouldn't it be great if the ARRL raised the status of QEX to that of a sister publication of QST? Both could be nice and glossy (and crammed with ads). QST would be mandatory with ARRL membership and QEX optional, like the relationship between, say, Physics Today and Phys Rev Letters. QST could keep recycling the SWR meter material and QEX could publish very technical works without apology (as they, no doubt, do now).

Pie in the sky?

|
|Hmm. I thought that, once you transmitted on a band, you had to stay
|on that band for at least 15 minutes.
|
|WZ2B
The time limit is 10 minutes for the CQWW contests. This rule was
enacted specifically to address the use of an octopus.

After the initial posting, I discussed this with contesters N2AA and N2EA.
Gene was reminiscing about the days when the octopus was still
legal for field day. Apparently, he and K2SS were able to get into
quit a rhythm using the device and had a ball. Sounded like they
were sorry to see it go.

Putting up a beam would be very difficult for me I plan on having one in
the future but just can't do it now for several reasons.

>3. It is sometimes necessary to use >200W on 40/80/160 to get over QRN,
> especially during summer.

This is a very good point but on the othter hand this past FD shortly after
sunrise there were alot of QRO nets that wiped out the band for our
40m dipole station.... Next year we know to QSY off 40m after sunrise.

>4. The use of omnidirectional antennas is appropriate to a roundtable,
> which is typical of 40/80.

Right on... maybe even on other bands like 10 meter nets but of course
NOT the 20 meter DX nets. As a matter of fact I've stayed of 20m since
I don't have a beam nor amp. 10m, 12m, 15m, 17m and 40m seem to suit
me just fine with 100 watts and an omni.

>5. Ever see an 80 meter beam on a tower ? I've seen K0RF's. It looks
> tenuous.

Hey anybody have a 160m beam in their back yard?

>Yes, one can do a lot with antennas. However, it isn't the technology

Maybe whenever we give an S9+ report we should tell them to QRP but
some how I don't expect they would. Maybe they wouldn't even know how to!

3791. QRP vs. the KW Monsters!

Newsgroup: rec.ham-radio
Date: 1990-06-27 15:06:03 UTC
From: enders@plains.NoDak.edu
Message-ID: <5169@plains.UUCP>
Source record: 10698

The problem with working QRP (IMHO) is that there are soooo many ops running their KW monsters all the time that anyone listening soon learns that he/she has to turn their RF gain down to keep from being blasted out of their chair. If everyone on 20 meters ran 5 watts (you probably don't even need that much most of the time) and depended a little more on operating SKILL, the nasty problems would be greatly reduced.

Of course we'll never get everyone to QRP to 5 watts on 20 anytime soon. Nor will we get rid of those folks who think they *own* a frequency and will defend their *claim* with every last milliwatt of power at their disposal.

I think the people on 30, 17, and 12 meters would attest to the fact that they really don't miss the old KW anyway. :-) I think the two things lacking in HF operation today are COURTESY and PATIENCE. Sadly, this is the root of just about all the trouble on 20 these days.

This is the GENESYS system that was first introduced about two years ago. As I recall, it stirred quite a controversy due to its "black magic" nature and sketchy details as to how the system worked. A lot of engineers were claiming it violated the laws of physics. I saw Mr. Geddes present a paper on the system at the 1989 NAB convention. My coworkers and I couldn't tell if it was real or snake oil. They also had a demonstration that wasn't working when I went to see it. A coworker said they sort of got it working the next day (apparently there was a lot of crosstalk between the two "channels").

At this year's NAB, another paper was presented that gave a lot more detail on the system and outlined plans for testing it on the air. This time around, it seemed more like a real system, but still had some "snake oil" aspects to it. However, the jury is still out at least until the tests are completed.

Personally, I think it would be great if the system works, but you don't get something for nothing. I think we'll have to give up something to get two video broadcasts on the same channel. Whether it's something we're willing to give up is another story.

3795. QST, CQ, Tech Content, blah, blah

Newsgroup: rec.ham-radio
Date: 1990-06-27 16:54:56 UTC
From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9006271654.AA18661@bunny.gte.com>
Source record: 10704

I've written a few articles that have been published in QST, and I can assure you that they do not have a flood of technical articles being held back because they want to fill QST with general interest articles. The published my article "How to Have Fun in Ham Radio" in the May 1990 issue, when it had been accepted for publication circa January 1989! The editor said that they had so many general purpose articles "on the hook" that the 18 month delay was not unusual.

I would bet that if people who complain about the lack of technical content, or the lack of microwave coverage, or the scarcity of pages dedicated to the Albanian 160M EME Amtor contest, were writing about these things instead of whining, there would be no reason to whine. Ahhh, I suppose then they'd whine that there wasn't enough room for ads.

As far as the ads in QST, objecting to the quantity of ads in a magazine doesn't make a hell of a lot of sense:

A. They keep the price of the magazine down.
2. NOBODY FORCES YOU TO LOOK AT THEM!!!!!!!!!!!!!!!!!!!!!!!!!!

I personally never really look to QST, CQ, or HR for deep technical content, anyway, just as I don't look at Popular Science for depth in robotics or solar power. There are zillions of great technical journals providing depth in just about any area you could desire. Most of the good technical articles in the journals are written by motivated people, and are oriented towards a narrow target audience. If you want to read about ducks, buy a book about ducks, not one about birds.

Two credos to live by:

1. If you are not part of the solution, you are the problem.
B. Lead or follow; in either case, get out of the way.

and my personal favorite (after STUFF HAPPENS):

III. Don't worry about the horse being blind, just keep loading up the wagon.

>>From: price@marlin.NOSC.MIL (James N. Price)
>net discussions about limits on power. But the true DXer will do
>what he/she feels he/she HAS to do to get thru!

And that is precisely the problem! All too often this means crank up the KW (or more, as other posters here have pointed out) and clobber anybody and everybody in the process. It is this selfish attitude that is the root problem (bear in mind that I am *not* suggesting that James N. Price is in anyway an example of either THE problem OR of the selfish attitude - I am merely borrowing a segment of his posting because I think he hit the nail right on the head).

I have read a number of postings in this newsgroup about this subject. Some revolve around antennas, some revolve around power. I suspect that from the *hardware* side of the argument, it is more realistic to call for a reduced power level, arguments about noise levels on some bands notwithstanding, because from listening I know that it is true.

I can feel most comfortable discussing that part of the low bands which I can legally operate (and for which I actually own equipment for) - the Tech. segment of ten meters. It always used to gall the hell out of me as a Novice that high-power dudes would decide that my puny but legal 75 watts was just the right place to tune up. Now I'm sure that there were some occasions when an op. just *didn't* hear me and thus assumed that nobody was there to QRM. Fine, I can live with that. But it used to gall me that many of these clowns would then start transmitting on that frequency. Why does even a General (again, Advanced or Extra included) need to deliberately go into the novice segment of the band, tune up and then transmit with an absurdly high level of power? Isn't there enough spectrum available for Generals and up that the Novices *can't* use? AND, as a "Tech. on Ten", the same sort of question, by analogy, comes to mind. I don't have CFR47 right in front of my face, but I *think* I am limited to 250 watts from 28.3 to 28.5; if that is true, why not limit EVERYBODY using those freqs. to the same UPPER limit, 250 watts max.? Seems to me that this would be eminently fair - 250 can do an awful lot of good with a reasonable antenna. Then if those who CAN work above 28.5 or below 28.3 want to use a bunch o'power, at least outside of that measly .2 MHz they won't interfere with those who are legally stuck with the reduced power level.

Yeah, I know, "this will just complicate everybody's operating"....well, we Amateurs, by reasoning that we have to take a test that requires us to know how to read, are at least semi-literate and intelligent, right? :-)

A note: if the recent rumors about V31BB's passing are true, I would like to state (since I was one who was publically upset with his on-air

anti-MFJ rantings) that I am sorry to see this happen, albeit with details unknown. While I (and others, I'm sure) may have disagreed with what he was doing, as a human being I am saddened to hear of his (possible) demise.

3799. ARRL books (was Re: Making ham radio known)

Newsgroup: rec.ham-radio
Date: 1990-06-27 19:08:23 UTC
From: iza@ecs.umass.edu
Message-ID: <10151.26890427@ecs.umass.edu>
Source record: 10699

I read on rec.ham-radio some criticism for the policy of ARRL to distribute
a book on Microwaves from RSGB and the lack of ability of the ARRL to
publish books on such subject.
My point of view is totally different and there I go with my 2 cents!
ARRL books are, to my knowledge, some of the best books on Ham Radio in
the world. I mean it, because I have a big collection of Spanish, Italian,
French, German, Dutch, English and American books and, even with the
problems involved on purchasing some of the components used on circuits,
the quality and the care put on explaining things are worth the money.
If you ask other hams around the world they all will tell you they have
at hand the ARRL Handbook. And in some Eastern European countries one
of the best presents was a current copy of THE handbook... as well as in
other parts of the globe.
Well, I think I make my point clear. ARRL books are a heck of ham books,
and I wish and expect there will be more. But they cover for now much of
my needs as a ham. Maybe if they publish a handbook on Coherent CW or
on Hellschreiber machines... :-)
73 for all.

> hope 73 continues to survive as it is the only remaining "user" written
> technical magazine that we have. Hopefully, 73 will begin to publish some
> of the more technical articles that previously went to HR and now no longer
> have a home.

I would not put it that way. I subscribed to 73 for about 5 years up
to about 3 years ago (when I switched to HR). Initially it was reasonably
technical though not significantly more so than QST -- just different.

Then about a year before I gave up, the technical content drifted downward
to the point where the MOST advanced articles were about at the Novice
level. Between that and the ever increasing amounts of NSD-ravings I called
it quits.

As for CQ, many earlier postings echo my opinion of that rag.

QST is, unfortunately, rapidly sliding downhill too. The first 2 or 3
"wonderful elmer" articles were fun, but enough already! it's sickening
to see 10 pages of that stuff every month. I've been maintaining an
on-line index of the technical articles from my QST collection; it's
very informative to compare the number of entries per month. It has been
dropping quite a lot. (Hm... I should graph it and submit an article!)

With HR gone, it seems that there are now NO technical magazines for hams
left in the USA. (I'm not counting QEX; it sometimes tries, but it's
rather small.)

Incidentally, in response to the statement that we shouldn't complain unless
we're submitting technical articles to the rags: that's baloney. The
STYLE of a magazine is set by the editorial staff, NOT by the article
writers. I can't imagine that the editors of a contest magazine would
suddenly start to accepts lots of highly technical articles; ditto for
Wayne Green.

Couldn't agree more. Cancelled CQ two years ago as it was and is junk mail. Fortunately, I am within 4 months of renewal of my subscription so will test CQ's ability to change their ways and have so informed Dick Ross, Publisher of CQ.

If CQ doesn't shape up, I suggest you take their offer and cancel for a refund. Lots of cancellations will certainly get their attention. Ham Radio may not have had a big circulation, but ten or twenty thousand cancellations and refunds will certainly put a dent in CQ's economic analysis of the acquisition.

> technically inclined than the average ham and would like to see more
> technical articles in QST or anywhere.

While there are only a specified number of pages of "technical" material
each month, I think the gripe I'm hearing has less to do with quantity
than with the level of technical sophistication. It is absolutely
intentional. Perhaps this extract from the ARRL Author's Guide will
help spell it out:

ARTICLE TYPES QST QEX
------------------- ------------------- ------------------------
Construction Projects easily Enough information for
reproduced by readers familiar with
majority of hams. common construction
Simple projects with techniques to duplicate
broad appeal. the project.
More complex, state-of-the-
art equipment

Theoretical/tutorial Help beginners learn Discussion of advanced
radio/electronics. topics.
Report new advances Theoretical analyses of
in technology, the radio/electronics topics.
latest designs and
constuction techniques.

So if "Another Look at Reflections" (remember? the mid-70's series
about transmission lines) were submitted today, it probably wouldn't
run at all ("too long"), and certainly not in QST. Things _have_
changed, no doubt about it. (Interestingly, there have been so many
requests over the years for reprints of that series--and the concluding

articles that the author, Walt Maxwell, never finished--that it is
being turned into a book. Walt and the editorial staff have been
working on it for a while now. So _somebody_ out there is interested.)

> In view of the demise of Ham Radio, wouldn't it be great if the ARRL
> raised the status of QEX to that of a sister publication of QST? Both

There has been some spitballing about expanding QEX, but I don't know how
serious it is. Tell your Director what you want. That's the quickest
and best way to effect change.

3809. Any FM in VHF Contests?

Newsgroup: rec.ham-radio
Date: 1990-06-28 03:08:35 UTC
From: bobw@col.hp.com
Message-ID: <24300020@col.hp.com>
Source record: 10632

After participating in the ARRL June VHF contest, I noted
again the absence of FM operation in the contest, at least
in my area (Colorado). It seems reasonable that most 'serious'
VHF contesters would have SSB capability and would tend to
make use of that rather than FM. But it also seems that there
are about 10 gillion ops with 2M FM rigs out there mobiling around or
whatever who would enjoy finding out how far a 2M simplex
signal can really go. (Colorado is especially well suited for this
with high mountains close to large plains.)

OK, so here are my questions:

1. Is the severe lack of FM activity in VHF contests
a fact in other parts of the country? If not, why not?
Can you characterize the type of operator (e.g. just out
driving around and works the contest, makes it a point to
get on the air for a few contacts, seriously pursues
the contest, etc.)?

2. What can be done to encourage more VHF contest activity,
particularly on FM? Or maybe this isn't a good idea at all?

Your opinions please.

On the subject of tekkies vs politicians:

I've given this subject quite a bit of thought over the past few years. Although I definitely consider myself a tekkie, I often take a strong interest in many of the political issues of the day -- and not just those of amateur radio.

The problem with politicians, and the usual reason I get interested in a particular political issue in the first place, is that they can cause a lot of damage with very little effort. Whether it's the ARRL Board in 1984 shooting down a perfectly reasonable no-code proposal or the US Congress in 1990 trying to abolish the First Amendment, the problem is almost always one of limiting the damage politicians can do.

Although it's very easy for politicians to drill holes in the dike, each of us has only ten fingers to use in plugging them. And while we're standing there with our fingers stuck in the dike, there's little in the way of *constructive* work we can be doing. I would much rather write code, build equipment and do other fun tekkie things than play politics. But when the politicians screw up, the rest of us have an obligation to try to stop them. In other words, getting involved in politics is a dirty job, but somebody's got to do it.

It would be nice if mechanisms could be set up to limit the power of those people who LIKE to play politics, so the rest of us wouldn't have to spend so much unproductive time keeping them in check. That was the original idea behind the US Constitution. I wonder how much longer it can last, given the pounding it has been taking lately...

Hmmm...I understood the rule to mean (for FD, anyway) that a transmitter was considered to be transmitting on a given band for at least 15 minutes after the first QSO for purposes of determining transmitter class. I always wanted to see how high a transmitter class I could achieve with as few actual radios as possible - I think 18A or so is reasonably possible with two transmitters with careful planning and work. Much more than that runs the radio count up, since you have to get into VHF/UHF.

Oddly enough, this is the one problem I expected to see that I _didn't_ see in setting up the packet switch here. (The packet switch is probably a worst-case problem; it has 3 computers: the PC and 2 TNCs.) Considering that the equipment is in a _wooden_ enclosure, so there's practically nothing between the equipment and the antenna, electrically speaking, and considering that the antenna is only about 30 feet away, I was amazed. Perhaps it's because a ground-plane antenna has very little response in the down direction? I don't think it's anything to do with the particular antenna, since I have a 2-meter antenna and a 220 antenna of different designs and neither one hears the computer. Maybe I'm just incredibly lucky. (Although other experiences on the mountain make me doubt that!)

I agree with Len (saaf@joker.optics.rochester.edu) almost 100 percent. Especially with his comment about QST being a mag for the entire amateur community. I feel that they address every segment and every interest at the moment. But I also agree that there aren't enough technical articles and maybe that's due to the emphasis placed on other areas. Len dropped a few good suggestions, and, in case anyone at ARRL is listening, here's another suggestion.

How about a separate technical section? It could be one of the "tear-out" types that you often see nowadays in other mags. These are usually a little smaller; they are separately saddlebound; and they are attached by a single (usually perforated) retainer that is bound with the magazine. In this manner they can either be left with the original magazine, or removed and saved separately. All the advertisements from parts and components suppliers could be placed in this "supplement", where the advertisers would be assured that their market would see them, even when they were removed from the mag.

Articles that required some special part or component would have to specify the source of such a part and more-or-less guarantee the availability of the part(s). Nothing will kill the credibility of a construction section quicker than the publishment of projects for which the specified parts can't be found.

I vote for a separate technical section, in which not only are state-of-the-art information published, but also advanced construction projects for radios, computer equipment and antennas. How about a series on the "third-world" radio that Julian McCassey mentioned that is under development at ARRL as a starter???

YES, YES, the directors DO listen and they ARE ELECTED by us members. There are seven director posts up for election this year, that's more than HALF of the directorships. Let's tell them how we feel about this attempt to redirect our technical appetites. The director and vice-directorships up this year are: Central, Hudson, New England, Northwestern, Roanoke, Rocky Mountain, Southwestern and West Gulf Divisions. Those of you in clubs, get petitions signed or resolutions passed which state your feelings regarding QST technical content and QEX status, make these interests KNOWN to any and all candidates and then, (for members only) get statments from the candidates and VOTE when you get your ballot. It COULD work.

Eric:
Given the crowded conditions on the HF bands today, variable passband, i.f. shift, RIT, notch filters and narrow filters help tremendously at times to isolate the one signal you are trying to work. At other times, they are not needed at all. You will probably find your HW-101 useable but unsatisfactory during periods of high QRM due to the receiver bandwidth and lack of selectivity features. There are very sharp digitally-tuner capacitor based audio filters available on the market in the $140 price range that would assist the HW-101 tremendously in CW mode. Such a device would not help SSB, though.

Memories are used to store frequencies and on some radios mode and other operational parameters. They are very useful when you work nets, cross frequency within a band, cross band or just to have one set to WWV to save tuning time. I use them for all the purposes mentioned plus save one to store the freq. of a juicy DX station in who is buried under a pile-up while I look elsewhere in the bands for another. Usine one memory and two vfo's, I can rapidly switch between three if need be.

In your price range are a number of radios such as the Yaesu 747, Icom 725 , and Kenwood TS-140. Most are without power supply (another $140 and up depending upon whether you buy a generic power supply, e.g. Astron, or the manufacturer's supply - which is usually overpriced for what you get) and lack bandpass filters beyond one basic filter. Ten Tec also makes (domestically) a rig, Argosy, I believe, in this price range which is reputed to be very good but I have no experience with it. Some come with

antenna tuners, some without. An antenna tuner is a practical necessity for the solid state finals rigs. If you are a traditionalist, Kenwood also still sells the hybrid TS-530 and TS-830 lines, I think - very good and rugged rigs. Personally, I would receommend the Kenwood TS-140S or Icom 725 as they give you all the necessities and just enough amenities - i.e. bang for the buck. Additional bells and whistles (TS-940, TS-950, Icom 767, 781, etc.) rapidly drive the price up to that of a small car (slightly used car?).

Drake no longer manufacturers ham radio equipment but continues to service their products. Drake TR-7's and other models are generally available at Ham Fests and used equipment dealers for reasonable prices ($500 range). All the contemporary rigs are good and personal preference plays a large part in selection. Reputation-wise, Yaesu does not rate well in customer support, Kenwood and Icom seem about equal and generally good if slow. Ten Tec is said to have outstanding customer support My experiences with all three Japanese manufacturers have been satisfactory.

I suggest you go the your local ham radio emporiums (Ham Radio Outlet has a store in your area somewhere plus there are others) and try before you buy. Almost all of the stores have demo units set up so you can operate them. If you are not a subscriber to any ham radio magazines, do so. I recommend ARRL membership and QST. If you are interested in a used rig, you may also find one at vendors who advertise in QST as well as other journals or area ham fests. Equipment information on older gear can be obtained from fellow hams with collections of QST's, CQ's 73's & the late Ham Radio magazines.

CQ magazine publishes a Buyers Guide which may have some value but I would be skeptical of it based upon the lack of quality evident in their product evaluations - whic are more like editorial commercials. They never say anything black about a product, not even slightly gray. QST product evaluations appear the most rigorous and unbiased.

As far as ham radio equipment vendors are concerned, most are o.k. and reputable but operate on slim profit margins, so don't expect any freebies. I bought my TS-430 at HRO in Anaheim and received excellent service. I have since purchased equipment from a range of vendors coast to coast with generally satisfactory results. My current favorite is R&L Electronics in Hamilton, Ohio. My method is to decide what I want and get on the telephone utilizing their 800- numbers or direct-dialing if they don't have one. There will not be a lot of difference in price - expect 8-15% discount from advertised retail or so-called ham-net price. You have to consider the value of saving sales tax (6-8% of the price tag) by buying out of state , shipping charges and wait time. Sometimes, particularly if you are buying more than a basic rig, you can shave another 2-5% or more off the price, save the sales tax, and get the dealer to pay for the shipping if you buy all items from one vendor.

Value of your HW-101 depends upon condition but generally would be in the $200 range at a ham fest - lower on trade in, I suspect.

Good luck and best regards, Wayne, KB6CSP

Actually, Al, there are. That's why site owners throw hams off the hill first. Well, maybe not always first, but in the back of their minds, it's not a bad idea...

PC on hilltops need to be in fairly well-shielded cases, complete with feedthroughs and such, and preferably no outward indication that it's a pc.

'Course, on our local hilltop, the biggest problem is the guy who runs three GMRS radios, with no isolators on the transmitters; the transmitters also put out broadband hash that flames our own receiver on 440.

But, heck, for the few more years that it'll be in existence, ham radio's a great hobby...

>
>Al N1AL

There is a potential for real problems here. What we do is use standard
shielding techniques (that the manufacturers should have already done)
to solve this problem.

Here is roughly how to do it.

1. Choose a multilayer motherboard. The inherent shielding
of having ground and power planes in the motherboard is
your first line of defense.

2. Scrape ALL the paint off all mating surfaces of the case.
Add screws every three to four inches to every mating
surface.

3. Add copper tape or copper screening to all openings in the
case.

4. Ground the case to the radio ground using low inductance
copper strap.

5. Use shielded cables to and from the PC.

This should be all you need to do to quiet the noisest PC. Of course
if you are going to leave a monitor and keyboard at the site, then
you have to treat them too. I strongly recomend that you do not leave
a monitor or keyboard at the site as doing so invites theft.

A well engineered RF site will use good quality hardline for ALL RF
cabling including duplexer cabling. Thus RFI from controllers will
have to enter through the antenna which is way up the tower out of
the near field of the controllers. Of course those of you who maintain
repeaters know that most commercial installations are so sloppy that
they would embarrass the average ham.

>Does copying the ARRL message via usenet count?
>----------

I quote from the Field Day rules:

"7) W1AW message: A bonus of 100 points will be earned by copying a special ARRL Field Day bulletin sent ofver W!AW on its regularly announced frequencies just before and during Field Day. This message can be recieved directly from W1AW OR BY ANY RELAY METHOD..." (emphasis mine).

So I'd say usenet is fine, but I think the rules also imply that you have to recieve the message AT the field day site, DURING the contest period. Not 5 days later, at home.

Sorry to post this but all attempts to Email have been bounced.
G-QRP is the British QRP club. I joined it mainly because I am a Brit myself
(but not a ham when I lived there).
FYI there is also an active Michigan QRP club as well.
If you are interested in membership in either of them, let me know and
I'll dredge it up for you.
I tried mailing to you through bitnet @gargoyle.uchicago.edu and it bounced
and I also tried through uucp obdient!wheaton which also bounced. If you can
come up with a good bitnet path I can use that'll save me having to post.
The info I sent you about ARCI membership is from their most recent
QRP-Quarterly
magazine and is also the info I used a few days ago to renew my membership.
Hope you have fun with QRP and maybe I'll work you in one of the ARCI
contests or other QRP contest. The next ARCI contest is a ways off though,
October.

Funny....the contesters I know complain that it is dominated by traffic
and 2 meter types! I think the league has a tough time catering to an
increasingly factionalized hobby.

> Remember what happened to the Microwave column in QST? What happened
> to QEX?

I'm still receiving QEX. Did your subscription lapse?

Not a flame....just a couple of comments on a thoughtful posting by
Julian.

> I have had the misfortune to listen to 14.300 and 14.313
>for the past few days, and wonder what *we* or the FCC can do to
>stop this mess.

Well John...

Speaking as someone who TRIED, let me say that there is not a whole lot we can do.

Those who remember my sig block from December might remember I was promoting a NEW net on 14.313. For over a month at 11:00 EST, several of us got together to discuss politics, humanity, etc. Believe it or not, we actually managed to quiet the entire mele for sometimes several hours. We got the topic OFF the phone patch and traffic issue, and ON to something else. While our stuff WAS controvercial to say the least, We ran a NET. Checkins were only acknowledged if they gave their callsigns. Comments without callsigns were totally ignored. A few of the known QRM'ers actually checked in with CALLSIGNS so they could be recognized in the discussions. Following the net, we often had some very good roundtables. Propogation at Christmastime was the best I can ever remember on 20 meters. It was glorious. You could hear EVERYBODY, with NO dead spots. From close in, out to europe.

Eventually due to work schedules, many of the folks dropped out of the net, but a few of us tried to stem the tide, and though the QRM did pick up, we stuck with it. The official net was on Saturday Only.

Then guess who showed up. THE DOG. He decided that he did not like our net. He especially picked on the NCS, NR9Q, who tried to maintain order, but gave up in disgust, and tore down his 20 meter antennas.

I just tuned there before I read your article, John. It was just total chaos, as it often is.

I don't think the FCC is going to do anything. My opinion is they have turned their back on 313 the same way they did with CB. Some of those QRM'ers have been there for over a year. The CW jamming is very organized. I believe that many of those doing the interference ARE people who should know better, but who are emotionally involved. Thing is, the people they love to hate, like KV4FZ, and the rest ARE operating LEGALLY. THEY give call signs, they do not use fowl language. You might not like their opinions about phone patching and net handling, but they have a right to those opinions, and I suppose they have a right to their "mission" as well.

The FCC has given all parties til July something to settle their differences. (Barf, MM, Intercon, etc) ...

I used to listen every day. Without fail. I am, I guess the one responsible for the 75 meter boys moving there and trying to make it into a ragchew frequency. We brought people from 3849.5 and 3950. Some of the 3868 crew also showed. Some of the "big gun" 75 meter personalities like Farmer Bob, Zimbabwe, OEC and the rest.

I made some very good friends on 14313 back in december during the time it was saner. I have some good warm memories about it. I even had "my own" qrmer, a guy who played back one line I had said while making fun of some of the other ops.

Well. THIS is a world wide forum, and we here on USENET can "KEY DOWN" and give our opinion on the situation, and not be QRM'ed.

I run a pretty powerful station on 313 with an omni pattern. If someone wanted to try again to bring order (don't even think about it unless you have some power to back up your ideas), I will participate. I will NOT, however, be discourteous to ANY operator who signs his call, and that includes the barf boys who everyone seems to hate. I had some nice talks with THEM also. They can be pretty reasonable if YOU are reasonable. What WE did was drag THEM into are net as participants, and that got them OFF talking about their "mission" and ONTO something else.

It could be done again.

Did anyone hear the net we ran back around Christmas time? Was it better than what is there TODAY?

As long as the sunspots cooperate, bands like 10m and 15m are certainly the best for low-oomph stations. But let me encourage everyone not to give up on 20m just because you don't have a KW and a tribander. That's where I got the vast majority of my awning DXCC contacts. (10m and 15m weren't doing much at the time; the awning is a lousy antenna for 40m and 80m; and my radio doesn't have the WARC bands.)

If you're patient and clever enough to outwait or sneak around the big guns, 20m is fine for lower-powered stations. Contests are especially good; after the loud stations have worked the ones you want, you can jump in there and get them.

3828. How to deal with TVI

Newsgroup: rec.ham-radio
Date: 1990-06-28 17:21:35 UTC
From: flash@lopez.UUCP
Message-ID: <1990Jun28.172135.11814@lopez.UUCP>
Source record: 10636

Tennesee Valley Indians. It is something all hams dread. AND if you have ever run more than 20 watts, YOU have first hand experience with it.

Those of us who run a bit more power (I want to see the hands of OTHER Henry owners!) have all had a lot of first hand experience dealing with RFI in its various and nasty forms. Over the years I personally have had many different occaisions to solve my own RFI problems, and I think perhaps we can all contribute to the overall body of knowledge on the subject. I think I have tried just about EVERYTHING, but perhaps I will leave out a few things because no one gets to be in ALL situations...

Here are some TVI tips from the Eccentric Old Hippie....

1. Buy a cheap TV set and put it in your shack. Mine is on a stand next to the linear. I keep it tuned to the Weather Channel, which also gives you the latest info, and ALL hams love to talk about weather. If you notice the wigglies where there were no wigglies before, it is an indication that something is letting loose. If you catch a problem BEFORE it affects your neighbors, you are ahead of the game.

2. Get some copies of the FCC TVI pamphlet. It is part of the standard handout I do when I visit a new neighbor. This will give them an understanding of what different types of interference look like. It is not always the guy with those funny antennas...

3. Check your ground system EVERY spring. Replace any fittings that look corroded. Don't be cheap about it, just replace them. Make sure everything makes good contact.

A good ground system is your first line of defense against TVI, so let's consider it for a moment. I used to have some terrible TVI problems when I first started running power. What worked for 100 watts was a joke of a ground system that was not effective at 1500. Your mileage may vary, but here is what I did...

a. Keep the runs to your ground system as short as possible. If you can have your station in the BASEMENT (where most hams wind up by default) so much the better.

b. Because of the skin effect, you will want to use a large outer diameter. Instead of spending a fortune on #4 copper, you can get the same effect by using the braid of a run of COAX. I use RG-59 for my ground run, and use the shield for my ground wire.

c. Beware of "floating ground". If you use a ground stake, it could wind up being at a different ground potential than your house wiring. For this reason, if you CAN, tie your ham station to the cold water pipes. This was the magic in my case, and though it involved drilling some holes in a wall (Send the XYL shopping first) you will find that the ground makes all the difference in ALL types of RFI.

d. Tie all the grounds in your shack together. This is where QST would say to be neat, but NO ham I ever met was neat. Just keep them short and try not to get them tangled with everything. Again I prefer to use COAX for the ground, but any good heavy wire will do fine.

e. If you pick up some official braided ground strap at a hamfest use it by all means, but coax works exactly the same, and we all have rolls of coax.

You might think I spent too much on the ground system, but since it is the first line of defense, I think it deserves it.

4. YOU make the first move. This might sound like asking for trouble, but when I bought my amplifier, I told my neighbors I was installing some new equipment and that I wanted them to tell me if they had any interference, and if so, mark it down as to type and time. Do not make the mistake of getting into the "it's their problem" mindset. Sure it is their problem, but if you can avoid a lynching party, you are ahead of the game. I also called the cable company, and talked to the chief engineer. Most cable engineers are also into electronic hobbies, and if you are lucky the CE at your cable outfit might be a ham. This will help them isolate problems in their system. Yes if your signal gets into the TV in a cabled community, it is usually the problem of the cable company.

In my case the cable company had to rewire the entire block with RG-6. They also gave me a roll of RG-6 to rewire my own house. When an cable amplifier on the pole in front of my house let go, I could take out the entire south side of town with 10 watts. I found the problem immediately, and saw it go the moment it did, (remember the TV on the stand next to the amp?) When I saw it trash out, I shut down and started checking my own gear first. I was smart enough to stay off the air til the next day when it was fixed.

I also bought a bunch of ferrite donuts and a slew of TVI filters. I gave them to the neighbors who reported problems. You do not have to do this, but PR goes a long way.

Most people value their TV the most, but you will also have problems with neighbors phones, stereos, and broadcast radios. I have found the hardest problem to fix is a cheap vcr, especially with 75 meter operations, since the video heads ARE a 3-4 mhz RECEPTION SYSTEM. The ferrite beads and cascaded TVI filters can help a little. My own JVC VCR in a nice metal case records and plays just fine with NO squiggles.

Of my own stuff, the only problem I have is that I trash out my dolby surround sound audio system. It took a lot of tinkering and rewiring and grounding, but you can cure just about everything but fundamental overload. (I also have some very long speaker runs because the dolby system feeds TWO different viewing sites in my home. Since I don't watch TV and ham it up at the same time, I just shut the thing off.

Cheapo plastic telephones may not respond to choking the phone lines, but since a phone is NOT designed to receive radio signals, if it DOES, the problem is usually the phone, ESPECIALLY of you are properly grounded to minimize local RF fields. I have been able to convince neighbors to get a "real" phone, and the problem went away.

I personally do the bulk of my high power operating after midnight. Your schedule may not permit this, but it is one way to keep everyone happy. If you don't know who to talk to after midnight, join our group on 3950.

Initially it was a lot of work getting my station and my neighborhood TVI proof, but the results are worth it.

And it is nice when you have just signed off the air with a rag chew on 20 to go outside to do a perimiter check and have the neighbors wave a friendly hello.

3829. Amateur Radio Software Programs

Newsgroup: rec.ham-radio
Date: 1990-06-28 17:49:25 UTC
From: reichert@motcid.UUCP
Message-ID: <3755@cocoa46.UUCP>
Source record: 10631

To any Ham out there that still has the itch to "Roll their Own" there's still help. New Software Programs aimed at the Amateur who are not fully technical are now available;

A.S.P. Version 1.2 is a fully documented Narrow Band Preamp Design Program utilizing > DOS 2.11 and CGA. Automatic or Interactive Designs, N.F. Optimization, Matching Circuits, and More! Auto Designs optimize for N.F. and output VSWR while maximizing gain or intermodulation distortion. Safe operating conditions for input protection are also provided.

Am-radio
:page=0
A.S.P. Version 2.0 the same as Version 1.2 but requires EGA. An added Screen Plotting Utlity shows Gain, N.F., and Output VSWR. Matching component values can be changed to optimize circuit.

T.A.P. Version 1.0 is a user friendly Triode Power Amplifier Program enabling design of Grounded Grid Amplifiers. Input/Output Matching, along with design parameters, documentation, and much more is provided. Requires > DOS 2.11 and CGA.

PLL3 Version 1.0 is a tool for designing 3rd Order Loop Filters. Documentation is provided. Provides BODE Plot of pertinent parameters and data display/ printout. User interactive program allows component value and system constant changes. Requires > DOS 2.11 and EGA.

For more information on any of these programs contact;

Folks, bear with me... I tried to send a reply to Stephen,
I believe was his name, it bounced so I'm posting hoping he'll
see this..
==========cut==========

From: tkelso@BLACKBIRD.AFIT.AF.MIL (TS Kelso)
Subject: NASA Prediction Bulletins

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical
to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
```

18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

Jon,

It seems to me the easiest way to fix it is to get involved. If you
don't like the attitude you see in your ARRL elected officials then
you have 2 options to fix the problem. 1) Vote for someone else that
shares your positions 2) Run for Director yourself! Its true that
one person can't change the whole world(over nite) but they can
have an effect. It just takes some pushing.

When I was at Dayton this year, I saw a book by H.P Maxim (ARRL founder) that was a real interesting piece of work. It was a bona-fide crackpot tome about using radio to communicate with extra-terrestrials! The book detailed some of Maxim's far-out philosophy, and was a real eye-opener concerning the "eclectic" interests of "our founder."

Anyone else run across this? I think it was titled something like "Worlds Beyond", although this recollection is vague.

>

There are very few FM contacts in this part of the country. About
10 years ago there used to be lots more FM but with SSB equipment so
much more available now the serious contesters have switched to SSB.
Multipliers are the name of the game and you just don't get that many
extra multipliers from FM stations. Also most of the FM stations are
just not interested in learning how to give proper grid square exchanges.
10 years ago all you had to say was "59 North Carolina" so it was a little
easier to coax random stations to give you a contact.

It is usually worthwhile to listen once in a while on FM but in general
you don't get many contacts from it.

> 2. What can be done to encourage more VHF contest activity,
> particularly on FM? Or maybe this isn't a good idea at all?
>
> Your opinions please.
>

Local clubs or contest groups would need to explain how to give proper
exchanges and what frequencies to use. This would have to be done in advance
since it takes too much time to do it during a contest (time which could be
spent working other stations). If you are going to do this I suggest you
bring it up at the club meeting before the contest, explain how to work
a contest station and tell what TIME you are going to be listening on FM.
Set aside an hour or two to work FM Saturday evening and don't waste
any other time looking for FM contacts unless the band is wide open.
You can only operate one transmitter per band so if you switch to FM you
should make sure that it is going to be worth your while; you will have to
stop working SSB until you finish FM even if you have two transmitters

capable of operating on the same band.

In summary, set aside a specific time you will work FM, then publicize it along with instructions on how to give a proper contact.

Good Luck and 73
John

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
> Your opinions please.

Well you did ask. Many of the folks who moved to VHF did so partly to
get away from the endless contesting and DXing that have ruined the
HF bands.

>Gary KE4ZV

Some of the cheaper import PC's don't even have FCC approval, so the chances of getting a dirty computer are pretty high these days.

Cheap PC's are probably some of the worst polluters, espescially non-metal incased computers such as C64's. But along the lines of IBM PC-clones, they are typically noisy, but RFI leaking through cables or in other ways getting into the actual radios isn't as much of a problem as it may seem. Far field interference down the feedline through the antenna is highly unlikely, considering most repeaters have some sort of bp/br filters in addition to helical resonators on the front end of the receiver itself. A good repeater setup should have RG-214 or similar double-shielded coax connecting the receiver, transmitter, duplexers, filters, preamps, etc. inside the shack. Even the noisiest PC would have a hard time getting into this type of coax. At least I've never seen it happen. Take into consideration that most people have no problem using their PC and TNC with a 2m rig, even with the radio and computer sitting right next to each other, typically neither being particularly well shielded.

The only possible source of interference would be near-field RFI caused by poorly shielded radios located extremely close to the computer itself. Monitors and hard or floppy disk accesses seem to create the most RFI. But once the repeater is up, disk accesses should be nil and it's easy enough to shut off a monitor. Harmonics generated by square and sawtooth waves from inside the PC should be pretty well attenuated by the PC's cabinet itself, no to mention the radios' cabinets. I frequently use an HT in PC labs filled with 20+ PC's and also in a machine room filled with VAXes, Harris machines, DEC and Apollo workstations, etc. and rarely have anything break squelch, even on a wide-open hot-front ended HT. How bad can it really

be? Admittedly, I've never use a PC in a repeater installation, but use one all the time on packet and never have problems. Even with the 2m rig sitting on top of the computer and using a 1/4h mag mount next to it on a filing cabinet.

3838. Re: IRCs

Newsgroup: rec.ham-radio
Date: 1990-06-29 03:06:29 UTC
From: ash@mlacus.oz
Message-ID: <537@mlacus.oz>
Source record: 10634

jneher@tenorman.Eng.Sun.COM (Jonathan Neher X62863) writes:
>I have gathered from reading this newsgroup that IRC's are
>used to mail QSL cards internationally. I still don't know
>exactly what they are and how they should be used when QSL'ing.
Some countries have stopped selling IRCs and some never recognised them. One IRC can be cashed in the form of stamps at a post office but the postage is worth the going rate for a sea mail letter. Three IRCs are supposed to cover one air mail letter. If a Dx ham asks for IRCs then it is safe to send them when you want a QSL back. note that the IRC is only a coupon, not postage stamps. Ask your post office for one. You may have to go to a major post office if the local one has never heard of one.

>Where can you get them?
Apart from post offices, look in the classifieds in ham magazines. Many Dxers sell them for 25c and up - some coupons travel extensively! The going rate may be much higher now, as I last bought some about six years ago. The post office will charge the local amount of an internationally agreed fee.

>Which countries should you use them
for?

Many countries that are signatories to the Universal Postal Union - but as getting that list might be difficult, look for tips in Dx columns to be safe. In SWL magazines I sometimes see a marking after someone's QSL brag list that denotes whether an IRC or a stamp was sent.

>Do you always send one along with your QSL card if you
>expect the receive a reply from a station outside the U.S.

The safest bet is a Green Stamp, ie US$1 bill. Watch out when sending green stamps to Asian countries - it is illegal in some and encourages pilferage in others. Some of us still QSL via the Bureau :-)

Message-ID: <9006290354.AA01463@cmr.ncsl.nist.gov>
Source record: 10640

To Jon Bloom,
I think that, at least this time, you've missed the point.
I know that you don't set the ARRL editorial policy, so don't take this too personnally - but you did a "company line" response when you had better ammo. Many of the arguers against the current QST editorial emphasis (like N8DGN) clearly recognize that they themselves are NOT in the mainstream of ham radio. They complain that QST editorial policy has written-off their interests entirely. 'DGN seems to be a microwave enthusiast. What has QST shown him lately? It wasn't very useful for you to tell him that he is out of the ham radio mainstream - why didn't you point out the two-part feature article on 903 MHz linears? At least it was above the antenna-switch technical level.

**** SOAP-BOX MODE "ON" ****
Many of us DO feel that QST should have at least ONE article above the lowest-common-denominator level (technically) each month. There is a claim that QST is a publication for ALL HAMS... Don't leave out the 5 or 10% with some slight technical background. Twelve articles transplanted from QEX each year couldn't touch all the special-interest higher-tech aspects of hamdom - BUT THEY COULD ILLUSTRATE TO THE NON-HAM WHO PICKS UP QST THAT THERE IS STILL SOME TECHNICAL CONTENT IN HAM RADIO. I share your view that articles are more valuable than monthly non-news special-interest columns. Is there ever any real info in Rip's satellite column? I think the complaints against the coverage of operating news and events, DXCC, etc., are unrealistic. Ham radio wouldn't have any frequencies if we ALL sat in our labs building great new gear. ARRL/QST has to encourage USE of the gear (VHF/UHF/SHF operating events and the "World Above 50 MHz" -{Bill WANTS more microwave operating news}) and QST has to cover events of interest to a large number of hams (like HF DX and operating events).
**** SOAP-BOX MODE "OFF" ****

Most of the people in this mail-group are in fancy technical jobs/schools and can't imagine what technical dolts most amateurs are.
"Nobody ever went broke underestimating the intellect of the American public". Does our national ham society's journal have to follow this rule so closely?

73, Bob W3OTC

3840. FM in VHF Contests

Newsgroup: rec.ham-radio
Date: 1990-06-29 11:00:01 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9006291408.AA19647@ucsd.edu>
Source record: 10655

Recently, Bob Witte, KB0CY, asked about the apparent absence
of FM in VHF contests. Here are a few comments:

1. FM is not very popular in VHF contests EXCEPT in California,
where it is the main mode on 2m, and almost the only mode on 220
and 432 (woops- 223 and 450).

2. About 10 years ago, the VHF contest rules permitted unrestricted
simplex FM activity. A few of the Big Gun multiops abused this rule
and "took over" the most popular simplex channels in metropolitan
areas. Consequently, stiff restrictions were eventually placed on
FM operation (no 146.52, for example) so the FM people who wanted to
communicate could do so without contest QRM.

3. Most FMers prefer repeaters and seldom spend much time on simplex.
As a result of the fact that contest stations can't solicit QSOs on
repeater frequencies, FMers may not be aware that a contest is in progress.

4. They may not care. Many FM-only (or FM-mainly) stations could not
care less about contesting. So it's only fitting that they should be left
alone. I think the FM restrictions are pretty reasonable.

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 24/90 VOM 22.06.1990

HERNE:

Der naechste ZRO-Test ueber OSCAR 13 wird am 30.06. zu folgenden Zeiten durchgefuehrt: um 18:40 UTC in Mode JL, Elevation 63 Grad, Squintwinkel 7 Grad; um 19:30 UTC in Mode B, Elevation 62 Grad, Squitwinkel 2 Grad. Gute Signale sind bei hoher Elevation und geringen Squintwinkel zu erwarten. Die Frequenzen sind fuer Mode B 145,840 MHz und fuer Mode JL 435,845 MHz. Eine genaue Anleitung zur Teilnahme ist in der cq-DL 8/89, Seite 495, nachzulesen.

HAMBURG:

Am 14.06. legte ein OM im 81. Lebensjahr bei der OPD Hamburg die Amateurfunkpruefung Klasse C ohne Probleme ab. Der glueckliche Lizenzinhaber ist Hans Mueller, DG7XH. Er wurde 1909 geboren. OM Mueller beschaeftigt sich seit ueber 60 Jahren mit Funkempfang und Amateurfunk. Er baute in seiner Jugend Detektorenempfaenger und spaeter den legendaeren Roehrenempfaenger Lafayette selbst. OM Hans ist fachlich nicht vorbelastet und auch heute noch mit speziellen Kenntnissen in der Fotographie beruflich taetig. Wir wuenschen Hans noch viele Jahre als aktiven Funkamatuer. Herzlichen Glueckwunsch.

FRIEDRICHSHAFEN:

Vom 29.06.-01.07. findet die 15. HAM RADIO mit dem Bodenseetreffen statt. Das internationale Interesse ist weiterhin ausgesprochen gross. Die Unterbringung der vielen DARC-Gaeste aus dem Ausland bereitet den Organisatoren jedes Jahr immer groessere Anstrengungen.
Wie in den Vorjahren kann auch wieder das Messegelaende zum Zelten und Campieren in Anspruch genommen werden. Erstmals wird auch der RSV e.V., der Radio-Sport-Verband der DDR, mit einem Informationsstand vertreten sein. Mit Selbstbauexponaten, die den Funkamateuren bis vor kurzem in der DDR zur Verfuegung standen, soll den Besuchern gezeigt werden, unter welchen Bedingungen Amateurfunk in der DDR betrieben wurde.
Zu dem bereits traditionellen "Round-Table-Talk" werden sich wieder die Repraesentanten der auslaendischen Verbaende treffen. Welche Bedeutung diese Diskussionsrunden haben koennen, ist an dem Beispiel CEPT-Lizenz zu erkennen, dessen Idee in diesen Run-

den entstanden ist. Damit fuer den Amateurfunkdienst wichtige Themen effizienter besprochen werden koennen, werden nur ein bis zwei Repraesentanten eines jeden Verbandes an diesem Meeting teilnehmen.
Die naechste WARC wirft ihre Schatenn bereits voraus. Unter der Leitung von Wojiech Nietyksza, SP5FM, findet ein Meeting mit den Repraesentanten der anwesenden Amateurfunkverbaende zur Vorbereitung auf die naechste WARC statt. Das diesjaehrige Vortragsprogramm werden Referenten aus dem In- und Ausland gestalten. Zum Rahmenprogramm gehoeren selbstverstaendlich auch ein An- und Abreise-Mobilwettbewerb, Fuchsjagden und Treffen von Interessengruppen.

NIZZA:

Fuer die europaeischen Funkamateure ist der 25.06. ein denkwuerdiger Tag: Vor 5 Jahren, am 25.06.1985, hatte die Fernmelde-Kommission die "CEPT-Lizenz" fuer Funkamateure gebilligt - siehe cq-DL 8/85, Seite 49 und 6/86, Seite 478 -. Mit dieser Empfehlung war der CEPT ein grossartiger Wurf gelungen: Sie erlaubt Funkamateuren den zeitweiligen Betrieb mobiler und portabler Funkanlagen in beteiligten CEPT-Laendern aufgrund ihrer Heimatlizenzurkunde. In dieser muss die CEPT-Lizenzurkunde 1 - fuer alle im Gastland zugelassenen Amateurfunkfrequenzen - bzw. 2 - fuer die entsprechenden UKW-Frequenzen oberhalb 144 MHz eingetragen sein. Dabei duerfen beim Uebergang in ein anderes CEPT-Land die Privilegien der Heimatlizenz nicht ausgeweitet werden. Die Zuordnung der nationalen Lizenzklasen zu denen der CEPT-Lizenz bleibt dabei den nationalen Fernmeldeverwaltungen ueberlassen, denen die VO Funk Nr. 2736 die Festsetzung der jeweiligen Pruefungs- und Lizenzbestimmungen uebertragen hat. Mit dieser vom Geist der Liberalitaet und Toleranz gepraegten Regelung hat die CEPT 1985 Massstaebe gesetzt, die weithin und weiterhin Nachahmung verdienen.
Bis Juni 1990 haben folgende 16 der 26 CEPT-Laender die CEPT-Lizenz eingefuehrt: Belgien, Bundesrepublik Deutschland, Daenemark, Finnland, Frankreich, Grossbritannien, Liechtenstein, Luxemburg, Monaco, Niederlande, Norwegen, Oesterreich, Schweiz, Spanien sowie Griechenland - mit laendermaessigen Beschraenkungen - und Schweden - nur auf UKW -. Von den ueberschlaegig 280.000 im CEPT-Raum ansaessigen Funkamateuren koennen damit aber bereits rund 255.000, das sind 90 %, ein solches weltweit einzigartiges Privileg nutzen.
Nachdem sich auch die CEPT-Lizenz in der Praxis weitgehend bewaehrt hat, ist die CEPT nun bemueht, eine vergleichbare Regelung fuer laengerdauernde Aufenthalte an festen Wohnsitzen in anderen CEPT-Laendern zu entwickeln. Wuenschen wir ihr dabei eine aehnlich glueckliche Hand wie mit der CEPT-Empfehlung T/R 61-01.

RASTATT:

Schluss mit Verdruss ueber mangelnde elektromagnetische Vertrae-

glichkeit - EMV - einem haeufigen Problem in der Naehe von Amateursendeanlagen, stellt eine Firma in Aussicht. Ihr ozonunschaedliches Produkt ist ein neuer, hochleitfaehiger Schutzlack, der einfach auf das Kunststoffgehaeuse gesprueht wird und Eintritt wie Austritt elektromagnetischer Wellen verhindern soll.

FUNKWETTERBERICHT: (19.06.)

Am 12.06. begann ein heftiger Magnetstrum, dessen Ursache nicht bekannt ist. der Mittelwert der magnetischen Kennziffer Ak stieg an diesem Tag in unserem Gebiet auf 88 Einheiten; auch die beiden anschliessenden Tage waren mit Ak = 64 bzw. 68 noch erheblich gestoert. Waehrend des Sturmes kam es zu Aurora-Ausbreitung, die erst am 15.06. zu Ende ging. Seitdem hat sich die Magnetik beruhigt. Die F2-Grenzfrequenzen, die zwischen dem 12. und 14.06. stark abgefallen waren, haben ihr frueheres Niveau von maximal 9 MHz wieder erreicht. Der gegenwaertige Rueckgang der Sonnenaktivitaet, in dessen Verlauf die Sonnenflecken-Relativzahl und die 10-cm-Strahlung am 17.06. bis auf 148 bzw. 179 Einheiten abgesunken sind, wird voraussichtlich erst am Monatsende zum Stillstand kommen und von einem neuen Aktivitaetsschub abgeloest werden. Bis dahin kann mit normalen bis maessigen und nahezu stoerungsfreien Ausbreitungsbedingungen gerechnet werden.

Ende des DL-RS Nr. 24/90 vom 22.06.1990

Well, I say what I think. Sometimes that happens to coincide with the "company line." If I remember right, the posting was about the microwave column. I've mentioned in several recent postings that there are other things published by ARRL--including feature articles--that IMHO more than make up for the loss of that column. Guess I should have said so in that response, too.

> **** SOAP-BOX MODE "ON" ****
> Many of us DO feel that QST should have at least ONE article above the lowest-
> common-denominator level (technically) each month. There is a claim

What's your definition of "lowest common denominator?" Looking over the past few months, I see a two-part article on 902-MHz power amplifiers, a two-part article on a PC-based weather satellite receiving system, an analysis of aurora techniques, an article on short top-loaded verticals (including--gasp!--integral equations), and an article on CP quagis for satellite use, among others. Now, none of those is breaking new technological ground, I'll grant you, but aren't they at least above the lowest common denominator?

> that QST is a publication for ALL HAMS... Don't leave out the 5 or 10% with

A good point, although I'm not sure who you are trying to get that message to. If it's the man on the street or the high-school kid, the present content of QST is sufficient to overwhelm them technically. If you are trying to impress the professional engineer, I think we'd have to go a lot further than you suggest. But maybe non-ham electronics hobbyists

would be drawn in by more technical content.

> are more valuable than monthly non-news special-interest columns. Is there
> ever any real info in Rip's satellite column? I think the complaints against

Well, Rip doesn't do it any more--see the title block on p. 68 of your
June QST.

> "Nobody ever went broke underestimating the intellect of
> the American public". Does our national ham society's journal have to
> follow this rule so closely?

Come now, Bob. It's not like it was the New York Post or the
National Enquirer. I'd like to see more techninal info in QST too,
because that's my particular interest. And who knows, if enough
people express an interest in having more technical info (and if
it's submitted for publication), maybe it'll happen.

3846. Grounding a roof top station.

Newsgroup: rec.ham-radio
Date: 1990-06-29 13:54:00 UTC
From: EVERETT@HIARAS.NRC.CA
Message-ID: <715A27FB513F00008E@NRCNET.NRC.CA>
Source record: 10646

Greetings all,

I have a problem that I am sure that another fellow ham must have
encountered before and perhaps could help me out.
I operate the University of New Brunswick ARC station located in
Fredericton, NB, Canada. The station is current in the process of
relocating its tower and we have a bit of a problem. The station is
located on the 3rd floor of the EE building with a 50 foot coax run out
to the antennas. The tower and antennas are located on a wide flat
(as in none-sloping) roof. It is at least 100 ft to the ground from the
tower site. As a result there is little we can do to ground the tower.
(Gasp! We do have lighting in the Great White North) To make matters
worse we are located in the older section of the building and there is
no good earth ground we can latch onto within the station. The only thing
we have is the normal 120 ac lines. There are no water pipes, fire alarm
conduits or other devices nearby. The only thing metal is the staircase
that goes down three floors and we don't know if it terminates in the earth.
(Also I don't like the idea of killing off my fellow engineers who happen
to be on the stairwell when a strike happens.) A ground to earth from the
tower would be a very long distance with a sharp 90 degree bend as it goes
over the roof. I can't find any I beams within the super structure that
might serve the purpose. I am open to whatever suggestions anyone may have.

Thanks for the space.

The cost of school is such that I am going to have to get out of
ham radio until I am sure that I can meet the tuition (sigh).
Here's the list of my gear that I am going to have to get rid of:

Drake TX-4C/ R4-C/ AC-4.....just back (4 days ago) from being overhauled by
Drake; still in the factory sealed boxes, with Drake warranty.

Icom IC-2SA....with extras, under a year old.

Kenwood TH-215A...also with extras, about a year and a half old.

Cushcraft R5....about a year old, with recent Cushcraft design updates.

I am the original owner on the last three pieces of gear; all are in very good
to excellent condition, and function perfectly.

Drop me a line at gray_s@dickinsn.bitnet, or feel free to call at
(717)-258-5477 anytime (I have an answering machine). Thanks!

> The ones I have are made by GE. In particular...
>
> - max plate, screen and grid voltages and currents,
>
> - plate dissipation, capacitance.
>
> Any tips for use in linear service.
>
>
Paul

The mention of a 6dq6 brings tears to my eyes (oh no, guess it's just allergies). That was the final in my first transmitter.

My older handbook says:

plate dissipation 18 watts
Cin 1.2 pf
Cout 15 pf
Cgp .55 pf

Plate V 250
Grid bias -22.5V /*class C? */
Screen 150V
Screen Ma 2.4
Plate Ma 75
Transconductance 6600 micromhos

6.3V 1.2 A filaments

I don't think I ever ran this tube linear though I did screen modulate one for my first AM contact (Guys I worked thought I was a girl because my voice hadn't changed. Took me a couple of days to make the second QSO..)

Hope this helps...

Ugh. Ick. Smells like politics, looks like politics, feels like politics, tastes like politics. Glad I didn't step in it.

Actually, this is one of the best places I can think of to argue ham radio politics. There's a wide, more-literate-than-elsewhere audience, and the free exchange of ideas not only encouraged, but not crippled by needless anachronistic impedimentia (callsigns, q-signals, morris crud, etc.) that somehow seems to accompany on-the-air discussions. Who knows? We might actually come up with a good idea or two!

Politics, you see, is what mankind evolved to replace battles.
- Brian

The release version of CT is now 6.14, which was first available at Dayton. Version 6 added true multioperator support which was not present in version 5. Of course, bug fixes and other improvements are also included. CT information can be obtained by sending an SASE (or $25 for the program) to:

BILL McGOWAN, KC1EO
33 TRUELL RD
HOLLIS, NH 03049

>Is it universal in being able to handle VHF contests as well as the HF ones?

What do you mean by universal? CT supports the ARRL VHF QSO Parties (June and Sept), I'm not sure about January (unless it's the same logging information and scoring).

jim, AD1C

> fingers crossed.

I can tell you that it *didn't* get into QST when I gave them first
option on it in 1987 (By "it" I am referring to my all band all-mode microwave
station series that went into Feb/June/October 1988 HR which detailed a
complete 10368 MHz transverter). They did say "too long" and "too technical".
QST suggested that it could go into QEX in a million installments. Although
QEX had handled the 10 GHz filters article I did previously pretty well, I
wasn't excited about a 15 part article.
On the other hand HR didn't really seem too sure what the article was
about... maybe it was just my poor writing style.

I have the impression that Paul Rinaldo would like to see QEX expand a bunch
and I wonder if we shouldn't consider trying to support him in this. I
got my copy of CQ like everyone else and I see no particular reason that
the current advertisers should be particularly helpful to articles of
more technical depth. QEX at least has some of the "fringe" advertisers.

I know that a lot of us are frustrated with the current state of
amateur technical publications but maybe even those of here on Usenet
can have more impact than we think.
Could we possibly overcome our differences and frustration enough to
actually do something in a coordinated way?
In a sense I think this question is a microcosmic view into amateur radio's
future. A lot of us care and we are all different. Can we effectively
work as a group? This kind of cooperation is what saved amateur radio
after we lost all the "good" spectrum above 200M in the early 1900's,
I believe we need it again if we are going to survive in the 21st century.

> We need all of that we can get.

Well not quite ALL, I mean, would you really want, for example, *every*
U.S. citizen to be licensed? There isn't that much bandwidth.

I agree, though, that moderately increasing the number of people I can
talk with wouldn't be such a bad thing. :-)

> Were those folks (since they were up on a mountain...) part of a club
> or organization...

Well, not those ones in particular, but I see (and sometimes even
participate in) Colorado Mountain Club trips.

> Is there a way you can arrange for a presentation at one of their
> meetings about ham radio?

Sounds like work! :-)

> Go try all the neat things you can do, and if you can do a favor for a
> friend or a stranger, let 'em know it was a HAM who did it!

Now that I can do and have been doing. Merely hiking with a radio on my
pack has generated lots of comments and questions. Thinking about it,
in my 13 years of Colorado mountaineering that's been a really rare
sight. I mention to people that if they have an emergency (very
unlikely), they should get ahold of me on up the mountain or whatever.

> has elapsed that all previous licenses have expired, how do you propose
> to
> comply??

It was my understanding that the FCC sidestepped that issue by issuing a "group license" to all citizens and residents of the USA. If they cared at all about callsigns, they might have specified "tactical callsigns selected by users" or some such gimmick.

This is a different age, Bill. In "our day" people felt the need for the structuring and order provided by licensing and testing - rules and regs and proper procedures and all that good stuff. Today's young people especially feel comfortable in a world of semi-organized chaos.

In other words, we were born in a "Why?" world. Today's society is a "Why not?" world. I'm not saying that's better. It's just the way it is.

3864. NJ "Scanner Law" PASSES in Senate!!!!!

Newsgroup: rec.ham-radio
Date: 1990-06-29 21:20:47 UTC
From: judice@oakisl.enet.dec.com
Message-ID: <9006292120.AA17957@decpa.pa.dec.com>
Source record: 10669

****
IMPORTANT NEWS FOR NEW JERSEY READERS!!!!!
****

There's good news and bad news... S-305 was PASSED by the New Jersey Senate. The bill has been referred to the Assembly Judiciary, Law and Public Safety committee. New Jerseyites are just two steps away from being able to legally use wideband receivers in their automobiles.

The bad news is that NJ's law enforcement community is complaining about the bill. I received a letter from Senator John Lynch (sponsor of S-305) urging supporters of the bill "to contact Assemblywoman Ford (Chairperson of the Assembly Committee reviewing S-305) to press for timely consideration of the bill by her committee and assure that the amendments to this legislation do address the legitimate concerns of law enforcement groups".

The address for The Honorable Marlene Lynch Ford is:

200 Main Street, Suite 2
Toms River, NJ 08753
201-240-2200

Senator Lynch attached a letter to Assemblywoman Lynch from P.O. Michael Brunson, chairman of the legislative committee of the NJ Police Traffic Officer's Association, urging ammendment of S-305. His concerns were:

- persons with the ability to receive police communications will interfere with emergency activities.

- they will try to avoid traffic tickets by ascertaining the location of patrols.

- And "many many more reasons that I could cite you and your committee" - though apparently he could not think of any at the time he wrote his letter.

I agree with Officer Brunson that anyone who uses a scanner to interfere with emergency activities should be ARRESTED. And that is exactly what S-305 provides for - misuse of radios is ILLEGAL, possesion is LEGAL. I disagree with his second point - having listened to police communications for a long time, there is little or nothing that would be of any use to speeders.

I strongly suggest readers WRITE or CALL Assemblywoman Ford TODAY, as well as your own assemblywoman.

Thanks,
Lou

3865. Remotely Tuned HF Beam Antenna

Newsgroup: rec.ham-radio
Date: 1990-06-29 21:22:17 UTC
From: gb@sunpix.East.Sun.COM
Message-ID: <3028@sunpix.East.Sun.COM>
Source record: 10651

Here's an idea for a remotely tuned beam for the HF bands. I'd like to hear about previous implementations, suggestions for implementation, reasons why it won't work, etc.

The plan is to put up a three element beam cut for 20 meters. At the center of each beam element there will be a tuning unit with a variable capacitor that can be controlled from the shack. By tuning the elements it should be possible to achieve optimum operation (gain or fb ratio, not both simultaneously) on any frequency on the band. Clearly some mechanism would be needed for measuring the performance to allow this adjustment.

If the tuning unit has sufficient range, it should be possible to operate the beam on 20, 17, 15, 12, and 10M by retuning the elements for proper resonance. The antenna would have increasing gain as frequency is increased.

This brings up several implementation questions for further research.

1) What sort of tuning unit?

I was thinking of a high-voltage variable capacitor constructed along the lines of one in the ARRL Antenna Compendium 2. The unit described there has two metal plates (one fixed and one moving) separated by a thin sheet of glass. The author claims greater than 10k volt breakdown and capacitance varying from 500pf to 10pf for a 4.5 inch square capacitor. I doubt I'd need more than 100pf maximum so I could reduce the size somewhat.

Anyone have other suggestions for a tuning unit? I'd like to avoid sliding electrical connections because of noise on receive. Commercial variable capacitors with high-breakdown voltages are very expensive. Any suggestions for sources of cheap ones?

2) What sort of remote control?

I was thinking of surplus stepper motors. They're pretty cheap, and compact. My impression is that you can know how far you've turned them by counting pulses so I wouldn't need another mechanism for determining tuner position. I've also heard that RC servos might be the right goods. Any suggestions?

3) What sort of performance feedback?

I thought about monitoring element currents with a small probe attached to each element. This wouldn't be too hard but requires putting a signal on the air (though maybe a small one) for adjustment

and it provides only an indirect indication of performance.

For a direct measurement, I thought of installing a few very
simple remote field-strength meters around the antenna. Using these I
could get a direct indication of relative gain and fb ratio. Again
this requires generating QRM for adjustment.

Maybe a few remotely controlled noise generators around in the
far field? This would allow adjustment with the receiver but other signals
might swamp a small noise source.

Any other ideas?

4) What sort of control in the shack?

I would probably start with simple manual controls (say a pot
for each) and maybe later try for computer control. A program with
some prestored tables could probably adjust the antenna very quickly.

Is anyone interested in discussing this?

> problems when I first started running power. What worked for 100
> watts was a joke of a ground system that was not effective at 1500.
> Your mileage may vary, but here is what I did...

Could someone please explain to me through what magic a "good ground"
can cure/prevent TVI? I have seen this claim many times through the
years, sometimes in reputable ham publications, but I believe it to be
a total crock.

For one thing, unless your ham shack is sitting right at ground level
with a VERY short ground cable, the equipment won't be at RF ground in
any case (4 feet is 1/8 wavelength at 30 MHz). On VHF/UHF, where the
TV channels are, it's even worse.

For another thing, so what if you COULD get the station equipment right
at RF ground potential. It's the antenna that does most of the radiating,
if your antenna system is working correctly. If you have VHF/UHF leakage
from transmitter or coax cables, grounding them might change the radiation
pattern somewhat, but this would be as likely to increase TVI as decrease
it, depending on the specific location of ham equipment and TV.

Seems to me that shielding, filtering, and reducing the RF field in the
vicinity of the TV set and antenna are the things to try.
Grounding is a red herring.

Source record: 10670

I recently returned from a diving vacation in Cayman Brac (ZF9), and on the way to and from our little 8-seater plane stopped on the island of Little Cayman (ZF8). This place was so beautiful, and the diving I did there so great, that I've decided to go back with the excuse of running a contest from ZF8. So here's the question I would pose to any other contesters out there: which one should I go for? I don't see where ZF8 would be much for CQWW (you have to get through the east coast wall for Europe), but it would be a great one for the ARRL contest in February. Trouble is, the water is cold enough by February that I'd have to wear a wet suit diving. Same thing for WPX. So...what contest (and I only want to run a CW contest) happens before the end of November and would be a good one with a ZF8 prefix? Any suggestions would be appreciated.

That sounds good in theory, but I still have this nagging, haunting fear that when Phil and the other tekkies finally perfect their phantasmagorical packeting machinery, the politicians may have made off with all the bands to use it in.

3871. 6DQ6B SPECS

Newsgroup: rec.ham-radio
Date: 1990-06-30 03:55:23 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9006300405.AA26340@ti.com>
Source record: 10676

My GE handbook gives these specs for the 6DQ6-B:

Fil Volts: 6.3
Fil Amps: 1.2
Pdis (Watts): 18
Max Ep: 770 (Supply volts, Design Maximum)
Max Screen Volts: 220 (Design Max)
Max Screen Watts: 3.6 (Design max)
Cin: 15 (without external shield)
Cout: 7.0 (without external shield)
Cg-p: 0.5 (without external shield)

In Horizontal Amp service (TV):
Ep: 250
Es: 150
Eg: -22.5
Ip: 65 mA
Is: 1.5 mA
Rp: 18,000 ohms
Gm: 7,300 uMho

A note says that in this service the design maximum positive plate pulse voltageis 6,500 and the design maximum dc cathode current is 175 mA.

73,
Dube Todd

3872. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-06-30 04:33:53 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006300438.AA02868@ucsd.edu>
Source record: 10674

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3873. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-06-30 04:34:38 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006300436.AA02855@ucsd.edu>
Source record: 10675

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

>extra-terrestrials! The book detailed some of Maxim's far-out
>philosophy, and was a real eye-opener concerning the "eclectic"
>interests of "our founder."

Many of you may be surprised to learn that Hiram Percy Maxim, son of
Sir Hiram Stevens Maxim was also the inventor of the world's first
practical firearm silencer. His father, H.S. Maxim was the inventor of the
first machine gun. His father's invention saw extensive use in the
hands of the Germans in WW1 in the form of the MG08. Son Hiram P's
invention was very popular with farmers, ranchers and mobsters until
1934 at which time Federal Law in the US made possession of his inventions
and his father's inventions subject to federal registration.

Hiram P's uncle, Hudson Maxim, was the inventor of smokeless gunpowder,
the self propelled torpedo, and a number of other explosive devices.

The phonetic alphabet can be found in the ARRL Operating Manual, which has loads of other useful info. Available by mail, at ham stores, etc.

I am looking for a low cost (< US$10K) spectrum analyzer that covers as much of 10 kHz -> 3 gHz as possible. The two units I've looked at so far are the Tek 2710 and the Hameg box. Comments on the 2710 in particular would be appreciated, as well as any other units you know of.

Thanks,

Rick Spanbauer, wb2cfv

> I got my copy of CQ like everyone else and I see no particular reason that
> the current advertisers should be particularly helpful to articles of
> more technical depth. QEX at least has some of the "fringe" advertisers.

It seems that the key is the advertisers. HR was driven out of business
by the lack of advertising revenue.

It seems that the advertisers have everything to lose by supporting
publications which help hams "roll your own". If I were in the business
of selling "rice boxes", it would be in my best interest to advertise in
a publication that encourages appliance operation. I am not putting my
product in competition with the article on the next page describing how
something similar can be home brewed. Nor am I trying to sell merchandise
to those likely to build it themselves.

If I were the paranoid type (which I am not), I would think that the
advertisers may have conspired to drive HR out of business. Any lawyer
types out there want to start a class action suit?

OK, :-)

Now back to reality. I think HRs demise is a result of the demographics
of the amateur radio population. Until we get a crop of operators that
think that there is something more to ham radio than getting a $10 or $20K
station and contesting (or DXing), there is little else we can do about
big monthly publications.

On the other hand, maybe the net is the perfect choice as a medium geared
toward technically oriented hams. We could standardize on .GIF or ORCAD
files to describe the circuits and distribute them in multipart articles.
Seems a bit like the comp.sources hierarchy here on Usenet.

>
>Why you 'big house' ops keep up this pretense of modesty is beyond me.

Damn--I've been found out!

How did you do it, Steve? Did someone who was visiting the Bay Area
drop by my mobile home park and notice the network of coax connecting
all the houses and feeding back to a giant antenna switch on my porch?

Did he perhaps take a nighttime aerial photo in which he could see that
I had switched on just the right awnings to form an arrow of RF pointed
towards Albania??

Oh, well--guess it's time I fessed up. Would you like me to write an
article for Ham Radio--er, uh, QST?, er, uh, QEX?, explaining how
I built a simple homebrew 68030-based controller to control which awnings
are active at any given time?? As long as the cat is out of the bag, we
might as well use the opportunity to give people one of the state-of-
the-art technical articles they've been clamoring for.

:-) :-) :-)

[This might be of general interest, so I'd better post. Something for Commonly Asked Questions :-)?]

In article <1990Jun21.044345.21793@cbnewsj.att.com> mea1@cbnewsj.att.com (michael.e.alterman) writes:
>Are there repeaters on 2M and 440 MHz around those countries as there are here,
>and will our current equipment be fine for accessing them, or do they have
>different requirements for access, such as special tones, or different offsets?

2M band runs from 144.0-145.99 in Europe. (so only 2MHz available)
Some interesting frequencies are:
145.200-145.575: FM simplex frequencies. 145.500=general calling frequency,
145.550=moble working frequency.
145.600-145.775: Repeater outputs. Inputs are 600 KHz lower.

Stay out of 144.8-145.0 (beacons), 145.8-146.0 (satelite).
Channel space is 25 KHz, sometimes 12.5 KHz (seldom).
Some countries still have repeaters on 145.8 or 145.825 (and apperently
don't care about disrupting satelite services :-(.

Working a repeater:
Don't know the American procedure, but in Europe most things are common:
For most repeaters, you need an oscillator of 1750 Hz to 'open' a repeater.
You send a burst of a few seconds, and the repeater will usually send its
callsign. Some repeaters are voice controlled, so 1750 Hz isn't required.
Subaudio etc not required, telephone access is never available.
All repeaters are open. Third party traffic forbidden.

70 CM situation is different in every country. For Holland: 70cm runs
from 430.0-440.0. Shift is +1.6 MHz, so input on 431.7, output on 430.1.
70cm is not as busy as 2M. If I remember correct, repeaters are from
430.0-430.2. Your best luck is to start on 2M. Note that repeater
allocation (as well as frequency allocation, which is the source of all
this trouble) is different in every country. Some lack 430-432, some
438-440, some both. Repeater shift is sometimes -1.6 Mhz, sometimes
7.6 (don't know the sign). As said, best start is on 2M.

Please don't take the situations on repeaters as representative for the
Ham community. You won't find me at those frequencies, for good reasons.

>Are the operating procedures on VHF/UHF repeaters similar to in the USA?
Don't know the American procedure. Just mention your call (_slowly_, English
is a second language for us) and tell what you want.

>Can we obtain directories of repeaters, before we leave home.
Send me your FAX number and I'll see what I can do (lists I have are a little
aged, but things don't change much)

>What is the required procedure for reciprocal operating privileges?

^^^^^^ ^^ ^^^^^^^^^
> nor improper.
^^^ ^^^^^^^^

It is ANNOYING! Why do you need more that one? Why do you even need to kerchunk at all? Just transmit, state your purpose, ID, and let up.

If you don't normally hear a tail on this repeater, kerchunking isn't going to get you anything anyway, so just listen for someone to answer.

If you do normally hear a tail (either a BEEP or just a noise burst) then you know you got in. If not, you might not have, or was seriously choppy.

If it is a test in and of itself, it is a complete transmission and needs and ID at the end of it, that means when the testing is done, ID it. Since a series of kerchunks give you no more information that ONE does, you only need one, and you need to ID at the end of it.

Contesting annoys a lot of people. Maybe if the contesters would voluntarily limit themselves to a portion of the band, the attitudes people have against contesting and contesters would ease up. Maybe the contest promoters could improve the situation. I think I'll hang on to my "new" subscription to CQ just long enough to ask them to make their contests off limits to certain frequencies on all bands.

> Senate. The bill has been referred to the Assembly Judiciary, Law
> and Public Safety committee. New Jerseyites are just two steps away
^^^^^^^^^^^^^^
> from being able to legally use wideband receivers in their automobiles.

Does this bill only exempt residents of New Jersey from the anti-scanner law?

Actually I suspect it is being written to exempt all hams, but the first point I am trying to bring up is that residents of New Jersey are NOT the only people affected by this bill. I want to urge anyone and everyone who has important postings on this to NOT restrict the distribution.

Now, maybe this time you will realize the matter in New Jersey is of a national concern, not just in New Jersey.

> The bad news is that NJ's law enforcement community is complaining
> about the bill. I received a letter from Senator John Lynch (sponsor
> of S-305) urging supporters of the bill "to contact Assemblywoman
> Ford (Chairperson of the Assembly Committee reviewing S-305) to
> press for timely consideration of the bill by her committee and assure
> that the amendments to this legislation do address the legitimate
> concerns of law enforcement groups".

We definitely need to write. And people from out of state can be just as important as people from in state. Remember to mention that without this change in law, for many hams the very act of crossing the New Jersey state line is a violation of state law in New Jersey. It isn't simply a matter of hams doing things like boycotting New Jersey, but rather that because it is a matter of law, we simply cannot go to New Jersey without risking arrest. Of course then our dollars are not spent in New Jersey, are they?

> The address for The Honorable Marlene Lynch Ford is:
>
> 200 Main Street, Suite 2
> Toms River, NJ 08753
> 201-240-2200

Write, even from out of state... ESPECIALLY from out of state.

> Senator Lynch attached a letter to Assemblywoman Lynch from P.O.
> Michael Brunson, chairman of the legislative committee of the NJ

> Police Traffic Officer's Association, urging ammendment of S-305.
> His concerns were:
>
> - persons with the ability to receive police communications
> will interfere with emergency activities.

This seems to reflect an attitude problem on the part of the Police
in New Jersey. Notice the word "will". An attitude of the assumption
of guilt has no place in law enforcement in any state.

> - they will try to avoid traffic tickets by ascertaining
> the location of patrols.

Again, that nasty word "will". Can someone verify if in fact the
word "will" really was used?

> - And "many many more reasons that I could cite you and your
> committee" - though apparently he could not think of
> any at the time he wrote his letter.

I bet these are ficticious.

> I agree with Officer Brunson that anyone who uses a scanner to
> interfere with emergency activities should be ARRESTED. And that is
> exactly what S-305 provides for - misuse of radios is ILLEGAL, possesion
> is LEGAL. I disagree with his second point - having listened to police

I am posting this message for Len. You can e-mail to him at
73147,3073@compuserve.com. Since I am not a ham radio operator, and know
very little about this project, please contact him with any questions. Also,
please mention where the information you received about this project came from.

RUSSIAN PHRASES FOR AMATEUR RADIO: UPDATE

This is a new 20-page syllabus compiled by W6HJK to help amateurs
better communicate with their Soviet colleagues. A 90-minute audio
cassette has been added to help with pronunciation. You need not be
an expert in Russian, only interested in "trying."

The booklet provides (1) English words and phrases for QSOs,
accompanied by (2) the Russian translation and (3) the English
transliteration, to assist you in pronouncing the Russian.

The syllabus follows the natural sequence of a QSO. There are
additional sections on the Russian alphabet, phonetics, CW characters,
numerals, and given names. Suggestions are made for addressing mail
to the Soviet Union.

The author undertook this project out of a personal interest in
improving the quality of his QSOs with Soviet hams and to enhance USA-
USSR relations. A nominal cost of $5 ($7 international) for the
booklet, and $6 ($8 international) for the audio cassette, are payable
to the Beyond War Foundation, the original sponsor and an educational
endeavor to build global dialogue and cooperation.

Requests should be sent to: RUSSIAN PHRASES FOR AMATEUR RADIO

>I have a problem that I am sure that another fellow ham must have
>encountered before and perhaps could help me out.
>I operate the University of New Brunswick ARC station located in
>Fredericton, NB, Canada. The station is current in the process of
>relocating its tower and we have a bit of a problem. The station is
>located on the 3rd floor of the EE building with a 50 foot coax run out
>to the antennas. The tower and antennas are located on a wide flat
>(as in none-sloping) roof. It is at least 100 ft to the ground from the
>tower site. As a result there is little we can do to ground the tower.

First, find out from the Facilities Engineering group how the
building is protected from lightning. Many buildings use the steel of
the building frame or the the reinforcing rods is the building columns.
These are supposed to be welded together and connected to a ground plane
established before the building was constructed. Otherwise, external
grounding cables are run down the outside of the building.

When running grounding cables for lightning protection, consider
lightning to run downhill like water. Loops and dips in the grounding
wire will fail to usher the lightning bolt to the desired sink. The
reasoning in considering that lightning runs downhill is that the
extreme voltage gradients present in the atmosphere during lightning
activity will also be established in the grounding wire and are a
function of the distance above the level of your grounding sink.
"Uphill" loops in the grounding wire will have the internal voltage
gradient overcome by the more intense lightning field and the conductor
will be blocked from carrying the bolt current away from the protected
structure, antenna or what have you.

There are also considerations that the 'down wires' can produce
side flashes through a building wall if there is a lower voltage path
within the building than there is in the lightning grounding wire. All
down wire paths should be inspected for possible alternative pathes
within the building. If you don' find them, the lightning bolt is sure
too.

Check with the Architectural plans for the building you are in and
consult with people who are learned in the lightning protection field.
Here in the US, our National Fire Protection Association (NFPA) has
a separate section of the code addressed specifically to lightning
protection which is separate from the normal wiring code.

3886. h-t battery pack meltdown!

Newsgroup: rec.ham-radio
Date: 1990-07-01 15:05:52 UTC
From: commgrp@silver.ucs.indiana.edu
Message-ID: <49407@iuvax.cs.indiana.edu>
Source record: 10591

Last week, a friend was carrying a large aftermarket NiCd battery pack for an Icom IC-02AT in his pants pocket. He bought something at a store, and dropped the change into the same pocket. A coin shorted the terminals on the top of the battery. The plastic case caught fire, burning a one-inch hole in itself and setting the owner's pants on fire. He escaped injury.

This was NOT an Icom product: Those have internal fuses (tiny wires). I don't know the brand; it was larger than Icom's BP-8.

I heard about a cop whose Motorola radio battery was shorted by loose pistol ammunition in his pocket-- A cartridge fired and the bullet went into his leg.

>
>Al N1AL

Ok the reason grounding is necessary is that your transmitter uses single ended unbalanced filters for interstage and output coupling. These filters are the primary method of suppressing out of band radiation. It does no good for these filters to bypass out of band energy to the chassis if the chassis is not at true RF ground. All you get is a "hot" chassis and radiation down the OUTSIDE of your coax.

It is relatively simple to get a good RF ground at your equipment. First, use several ground leads of different lengths between your equipment and your ground system. This breaks up any resonances in your ground leads at the frequencies you are trying to suppress. Second, I like to use the shielded ground trick. I use coax for ground runs with

the shield and center connected to ground and only the center connected to the radio. This prevents any ground lead that happens to be at a high impedance at the frequency of interest from radiating. This technique works sucessfully even if your shack is on the second floor as mine is.

>Seems a bit like the comp.sources hierarchy here on Usenet.

Let's give it a try!

This will not just benefit Usenet, imagine what it will do for the
amateur packet world too.

The last time schematic exchange was discussed in sci.electronics, no
one agreed on a format and the idea simply died. Some folks wanted CAD
readable format, some wanted their IMSAI to be able to display it, and
so on and on. Personally, I don't believe we need more than what we get
from magazines, for now - i.e., hardcopy diagrams.

There is also an attempt currently by Glenn Reid on finding an interchange
format for fancy email (i.e., including diagrams, and fancy fonts) around
PostScript. IMHO, even that would work for us. Heck, how about posting
a compressed version of PCL, even.

Are us Hams more rational and willing to compromise than the more general
sci.electronics community? I myself am willing to barf out code for the
Mac or the PC in whatever format the majority agrees on to make this
interchange a reality. Since I am with Printing here, I certainly would
volunteer to do a "Whatever-to-PostScript" translator and a "Whatever-to-PCL"
translator (although someone at HP can do the second job much better than
I can :-) for the project.

We can then stop posting ASCII J-poles :-). Someone gonna start with an
SWR meter or a Grid-dip meter??? :-) :-) :-)

Perhaps there is a silver lining behind CQ's takeover of HR, afterall; if
it will move us collectively to do something.

The Brain Interface Unit (BIU)
by Steven K. Roberts, N4RVE
Nomadic Research Labs
(from Nomadness, issue #9)

This issue's cover photo shows the Grand Turing Machine's bio-controller embedded in its interface shell, linked through visual, aural, and kinesthetic channels to on-board silicon-based systems. As shown in the photograph, every effort has been made to maximize communication bandwidth with the neuron-based system inside the flesh-shrouded head assembly. A 720 X 280-pixel display presents an apparent graphic overlay upon the system's binocular view of the world, spectrally peaked at 720 nanometers to minimize any ambiguity with reality and adjustable in apparent focus to minimize attention-switching stress. A second visual sub-window is provided by a circular optical reflector mounted on the solar attenuation shield, giving the controller a steerable view of conditions aft. Optional visual attenuation filters are shown installed, softening specular reflections while diverting airflow-borne particulates from the moist and delicate components of the image-acquisition optics.

Both of the rider's aural channels are coupled to transducers that allow transmission into the brain of synthesized human language, long-range bidirectional RF communication with others of the same species, alert messages, or any of a number of complex stereophonic wavefronts selected for relaxation, stimulation, motivation, or subjective time-compression purposes. Note that these transducers are of limited bandwidth, but can be augmented by miniature units inserted directly into the auditory canals, or alternatively by high-power acoustical drivers located behind the entire brain packaging system. Human speech utterances are converted into analog data by an input transducer, and are coupled through the audio network to speech recognition, recording, or communication subsystems as required.

Due to the human visual system's insensitivity to infrared and other useful wavelengths, the BIU incorporates powerful directional parabolic light transmitters, with two different degrees of collimation to accommodate varying road conditions. This has been proven more effective than constraining the beam's axis to that of the bike, since the bio-system is capable of rotating the entire head assembly to center the region of interest in its visual frame of reference (which is not necessarily co-axial with the bike's current physical trajectory). Whenever the system is traversing a region of the planet that is devoid of sunlight, reflections of these beams from landscape

features allow real-time decision-based navigation at normal velocities. A future version will reduce power requirements by overlaying an image-intensification system upon the visual field, but this is not a standalone solution (since it is beneficial for other autonomous wetware systems -- especially those piloting petroleum-based land vehicles -- to recognize the presence of the Megacycle and take appropriate evasive action).

The ability of the bio-system to track objects of interest through precise 3-axis positioning of the head assembly enables an additional level of interface with the on-board computer network. Three 40 kHz ultrasonic receivers positioned on the BIU's crown and temples receive a reference beam transmitted from the console. Pitch and yaw angles are derived from raw phase and doppler information, and are used by a dedicated processor to determine precise head pointing angle. This data, in quadrature form, is converted to conventional ADB events and passed to the Mac, yielding an apparent link between the rider's nares and the on-screen cursor. All mouse pointing is done with head movement; clicking and dragging are accomplished via handlebar contact closures antipodal to the data-entry keys associated with the user's phalanges.

The BIU is designed to cushion the relatively delicate host organism upon occurrence of rapid deceleration associated with impact. Should the human system separate from the Megacycle and become launched upon a divergent ballistic trajectory, the twin coiled cables carrying all interface lines will achieve full extension, actuating lanyard-release connectors. This is designed to prevent abrupt cervical misalignment or separation in high-velocity emergency situations.

Wetware temperature rise resulting from the accumulated losses of propulsion workload (exacerbated by the low thermal conductivity of the shock-isolating foam shell, especially under conditions of elevated ambient) can be controlled through a fluid heat exchanger closely coupled to the scalp and thermally pumped by a remote 50 watt Peltier-effect module. Continuous bio-system hydration is managed by the same fluid loop via a small sip tube to be positioned next to the speech output device (which doubles as the input port of the human alimentary tract and twin oxygen-uptake units).

Since the osseocarnisanguineoviscericartilaginonervomedullary system is essentially dependent upon fluid-evaporative cooling (despite significant augmentation by the heat-exchanger), there is potential for heavy accumulation of concentrated saline exudate within the BIU interface layer. This is reduced through an absorptive accumulator that can be manually cleared, as well as a circumferential fluid-removal channel that carries waste coolant back to the occipital region and thence into an overflow tube. These measures insure a minimum of irritation to the delicate ocular membranes under heavy load (the wetware information system, though only dissipating about 10 watts, is unfortunately dependent

upon the same metabolic processes that support the bio-engine's
fuel, waste, and heat management facilities).
In short, the BIU is the key interface link between the
Megacycle and all aspects of its biological host organism. It provides
crash safety, cooling, hydration, sweat removal, visual graphics
display, luminance attenuation, communication and entertainment
audio, a voice control channel, a view of the road behind, a steerable
light source, and a mechanism for hands-free mouse control.
And I never ride anywhere without it.

3891. Preliminary Agreement on 7 MHz for WARC-92

Newsgroup: rec.ham-radio
Date: 1990-07-01 19:00:57 UTC
From: rh@well.sf.ca.us
Message-ID: <18826@well.sf.ca.us>
Source record: 10594
Cross-posted to: rec.radio.shortwave,rec.ham-radio

A tentative agreement was reached on June 29th at a meeting of the informal working group concerned with shortwave reallocations at WARC-92. If it sticks, it could resolve the current (suboptimal) situation in which hams in North and South America share part of the 7 MHz band with international broadcasters.

The Industry Advisory Committee working group tentatively agreed to propose to the FCC that hams be allocated 6950-7250 kHz on an exclusive basis worldwide, while broadcasters get 7250-7750 kHz on an exclusive worldwide basis.

There will be a follow-up meeting early in July, and in a few months, the FCC will get together with US Government spectrum users and put together the US positions to take to WARC. So the above proposal is quite preliminary. But it was agreed to rather quickly, and no opposition was voiced within the group (pending successful reaccommodation of certain fixed services).

For in-depth and ongoing coverage of preparations for WARC-92, visit the "Airwaves" conference of Capital Online, a new computer conferencing system based in Washington, DC (202-833-1591; 300/1200/2400 baud, 8-N-1; hit the spacebar and type preview at the prompt).

OSCAR FD OPS A MAJOR SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 181.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 30, 1990
TO ALL RADIO AMATEURS BT

Field Day OSCAR Operations A Major Success

As many radio amateurs ponder last week's Field Day simulated emergency exercise, many a devoted FD operator will exclaim that they made their most contacts on 20M. While others will be inclined to say that 15M was the "hottest" band this year. However, for one day this year, those operating OSCAR stations at FD sites can say that AO-13 and AO-10 sounded, in many ways, like 20M! One operator that was surprised by the enormous activity while participating in FD '90 was AMSAT-NA President Doug Loughmiller (KO5I). Doug reported that he had never heard a day when there was so much activity on the birds. And most of the stations he heard were working from FD sites using emergency power. Another AMSAT stalwart, Jim White (WD0E), reports that he made 77 contacts during the first 2 hours of the Mode B segment from his battery powered FD station. Jim said that just when he thought that Mode B had "dried up," more new stations showed up on Mode JL for him to work. After FD was over, Jim remarked that he wondered why he doesn't hear these stations on the OSCARs more often. Still more reports have come in this week to the AMSAT News Service (ANS) about FD activity. W5IU, N8DUY, W0CY, and N5BF all expressed their satisfaction at working plenty of stations on AO-10 and AO-13 from their FD sites.

More than just a novel thing to do on FD, these satellites display their potential in providing another reliable means to move emergency message traffic out of a disaster area. Many of these FD stations mentioned above were using simple stations set up and operated under "less-than-optimium" conditions in the spirit of the FD event. AMSAT congratulates all those who undertook satellite operations during FD '90. If you didn't think it was worth it to set up an OSCAR station in order to make that one necessary satellite contact for a hundred bonus points for FD, think again. "QRZ FD, this is ...."

SILVER SPRING, MD JUNE 30, 1990
TO ALL RADIO AMATEURS BT

Deadline For Summaries Of Papers For AMSAT Symposium Nears

The AMSAT-NA Space Symposium and Annual Meeting will be held October 19-21, 1990 at the Johnson Space Center (JSC) in Houston, Texas. Coming as it does during a year in which two Shuttle missions were scheduled to carry licensed amateurs, this should be an exciting site for the meeting. With the added attraction of the Center's extensive museum and fascinating tours available, the attendance could easily break all records.

However, in order to have a successful meeting, quality papers must be presented. This announcement is to solicit appropriate papers. The AMSAT-NA Space Symposium, to be held in the JSC Visitors' Center Auditorium, is intended to feature talks on the latest in technology in both the manned and unmanned aspects of the Amateur Space Program. Talks on the MICROSATs and their use, Phase IIID, Phase IV, and SAREX are particularly invited. The session Sunday morning at the Ramada Kings Inn will feature presentations aimed at the beginning satellite users and including those wishing to try their hand with the RS birds, AO-13 and the MICROSATs.

Those wishing to present papers are requested to send summaries to the AMSAT-NA office 850 Sligo Ave., Suite #600 Silver Spring, MD, 20910 by July 15, 1990. Those selected for presentation will be notified by August 1, 1990. Final texts will be due in electronic form, either E-mail or floppy disc, by September 1, 1990. Reproducible figures and photographs will be due at the same time.

Let's make this the best AMSAT-NA Symposium ever. Get your summaries in right away.

STS-37 Mission to have Four Licensed Amateurs Aboard

It appears that when STS-37 is launched there will be a pile-up on both ends of the QSOs. When the crew for STS-37 was chosen, Ken Cameron KA5EWP was the only licensed amateur on the list. Since then, Ken has been very busy promoting amateur radio to his crew. In May, Mission Specialist Jay Apt passed the Technician Class license test. Recently, Ken has upgraded to General Class and Mission Commander Steven Nagel and Mission Specialist Linda

Godwin passed the Technician Class. Stay tuned to ANS for further updates on the STS-37 Mission.

Word received just prior to press time is that the space shuttle Atlantis, which was being prepared for a secret military launch shortly, is experiencing the same hydrogen leak problem that caused an indefinite postponement of STS-35. As a result, the entire shuttle fleet has been grounded by NASA until further notice. ANS will provide additional news on the STS-35 Astro-1 Mission as it becomes available.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 181.07 FROM AMSAT HQ
SILVER SPRING, MD JUNE 30, 1990

TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

Cross mode B and S QSOs are possible during MA 135 to 140.

The current attitude is:

BLON = 179.6 and BLAT = -4.7 for 02 Jul 90

Magnetorquing of AO-13 is scheduled to begin 02Jul90 and will extend for a few days. It can be expected that the transponders will be turned off during the magnetorquing period (which occurs toward the perigee end of the orbit). Once magnetorquing has been completed, BLON is expected to be 210 and BLAT is expected to be 0. Check the PSK, RTTY and CW bulletins on AO-13 beacons (145.813 and 435.651 MHz) for up to the minute Magnetorquing information.

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.
/EX
SB ALL @ AMSAT $ANS-181.08
AO13 TRNSPNDR SKED EXPLAINED

HR AMSAT NEWS SERVICE BULLETIN 181.08 FROM AMSAT HQ
SILVER SPRING, MD JUNE 30, 1990
TO ALL RADIO AMATEURS BT

As a point of explanation, the space industry uses the parameter Mean Anomaly (MA) as a term that describes a satellite's position in its orbit. An orbit of any satellite is broken down into 256 equally spaced (from an angular perspective) segments. Mean Anomaly 000 is the point in the orbit which is closest to the earth (perigee). Mean Anomaly 128 is the point in the orbit which is farthest away from the earth (apogee).

AO-13 can operate in a number of different modes:

Mode B: 435 MHz uplink 145 MHz Downlink
Mode L: 1269 MHz uplink 435 MHz Downlink
Mode J: 145 MHz uplink 435 MHz Downlink
Mode S: 435 MHz uplink 2400 MHz Downlink

In addition, AO-13 has two sets of antennae: High Gain and Omni-directional.
Except when noted in the schedule, the High Gain antenna are normally used
(they are configured for Right Hand Circular Polarization (RHCP).

The AO-13 Transponder schedule will indicate over what portion of AO-13 's
orbit you should expect a particular transponder to be operational.

3893. 2m antenna in the attic, bad?

Newsgroup: rec.ham-radio
Date: 1990-07-02 03:05:54 UTC
From: rfc@briar.Philips.Com
Message-ID: <101706@philabs.Philips.Com>
Source record: 10618

Got a question: Is it a bad thing to use a 2m antenna in the attic of the house? Does the roof and walls of the house attenuate the RF signal greatly? I had been using an antenna in the attic for packet. I noticed that my ability to connect to my local BBS (KD6TH) goes bad in the summertime. Thought it was tree leaf attenuation. Someone said to try an outdoor antenna. So, I did, and it made a big difference. Even though the outdoor antenna was one my brother used for his VHF scanner. A groundplane mounted 5 feet above the ground, on a pole in the middle of the garden filled with trees and bushes. (the pole used to hold a bird feeder!). Fed by about 50 feet of RG58 mostly buried under the lawn. This worked better than a DDRR antenna in the attic (about 20 feet higher than the garden antenna), fed by 40 feet of RG8 coax. (maybe the DDRR antenna is no good?).

I can see these possibilities:
a) antennas inside the house are a bad idea.
b) maybe the position of the attic antenna happened to be in a null
c) DDRR antennas are poor.

Don't have time to make a scientific test. Anyone know what is going on?

3895. Convert Icom IC255E -> 255A?

Newsgroup: rec.ham-radio
Date: 1990-07-02 13:03:52 UTC
From: eakin@rsmas.miami.edu
Message-ID: <7809.268f0df8@rsmas.miami.edu>
Source record: 10599

I'm working on trying to repair an Icom IC-255E for use on packet. It has a range fixed at 144-146Mhz. While this will work fine on packet, I'd like to be able to use it for occasional repeater use & most of our repeators are 146+.

Does anyone have information on the modification that separates the 255E from the 255A?

Tnx & 73.
Mark

Bruce Sawyer enthusiases about Caymanm Brac, etc., etc.

Here's a suggestion: go back there in late October or in November, 1990.
Take a good 6-meter SSB station and at least a 5-el beam.
Work the world. Lots of people on the West Coast, in Europe, etc., need
nearly all the Caribbean countries. For the East Coast, ZF8 has been pretty
common on Es.

Go to it.... 73, Bob W3OTC

There are also a <<lot>> of folks out there who have never even heard of
this network.

I think the number of hams who either know about or have access to this
net is a small minority.

Our repeater group has an 850 running here in Sandy Eggo. While the pinball machine may be descriptive on occation, it is not necessarily the norm.

When you have up to four link/remote bases online, it's very easy to get lost as to which reciever(s) are active and which transmitters are enabled (especially in cross-band operation). The 850 allows no courtesy tones or voice to id the carrier/PL closures. I prefer the tones, low level, low freq and of short duration. I think that a few seconds of hang-time go hand in hand with the voice-delay/kerchunk eliminator lash-up (on 220 anyway due to lack of Commercial surplus equipment). I don't like bursts of white noise, twice on each conversation turn-around on a simple Ker-Chunk repeater. And with the junky (aka SLOW PL decoders) on 220 radios, I think the voice delay is a SLIC way around the problem.

But the 850 is not without some bummer bugs, of which ACC, won't acknowledge, fix, or even tell you of. But that's another story (a long story). Basicly, to each his own. If you have one repeater on a clear (more or less, mostly less here in SoCal) let's have hang-time and telemetry. Zero hang-time for multiple repeater/remote base combinations with duplicate coverage.

Subject: Re: DTMF decoder chip

As for a simple digital pager circuit, I designed and built a slightly more sophisticated unit several years ago. I was in the process of writing it up when QST published one like it. I don't know the year let alone the month any more. One problem I encountered was due to the skew spec for the decoder chip. My design worked great with a direct path (ht to receiver to decoder). However, repeaters caused problems. Repeaters have low frequency audio filtering that tends to alter the levels of the DTMF tones. Typically, that changes the relative amplitudes such that the tones no longer meet the chip specs. I used some heavy filtering in front of the chip to compensate, however, that significantly reduces the ability of the chip to ingore speach. I get fairly regular false alarms out of the unit.

>or fb ratio, not both simultaneously) on any frequency on the band.

G6XN in his book "HF antennas for all locations" discusses simple beam reversing schemes using relays that short out capacitors in the centers of elements. I'd guess a similar technique could be used to vary the capacitance for the kind of beam you're talking about. A stepping relay with a few caps could be used. For just one band, I don't think the fine control you would get would really be that noticeable. A few coarser adjustments would probably suffice.

>If the tuning unit has sufficient range, it should be possible to
>operate the beam on 20, 17, 15, 12, and 10M by retuning the elements
>for proper resonance. The antenna would have increasing gain as
>frequency is increased.

As an existence proof of something easier, Austin Custom Antennas has some multi-band beams fed with open-wire line. You can do the tuning in the shack.

I have a 1986 Nissan hardbody and have exactly the same problem. I went
through the entire ignition system and cleaned it up--new plug wires, rotor,
distributor cap, etc. Then started bonding all the metal with braid. Each
step seemed to help a little, but the noise is still there. If anybody
knows a good trick to clean up this, I (along with Ken) would surely appreciate
any info. I have heard that running the power lead through the primary of a
13v transformer will help, but I haven't tried it yet. In my case, the rig
is an Icom 228H.

The above quote attributed to me (KA1GT) is actually what Glenn said. Please
be careful in editing. Also, from conversations with HR staff, including
Skip Tenney, I was under the impression that HR's sale was due to Skip wanting
to retire and had nothing to do with advertizing revenues. If you have other
information I would like to know (please quote your sources). The only way
to get your money out of a buisness if you want to retire is to sell it. There
are not many buyers out there for ham radio publications. I'm sorry HR had to
be sold, but Skip did a good job for many years and I would not blame hime
for doing what he did.

> fire, burning a one-inch hole in itself and setting the owner's pants
> on fire. He escaped injury.

This is not uncommon. A few years back I worked on a project
for the Library of Congress, Library for the blind. They had tape
recorders with NiCd battery packs which kept going up in smoke
(in the faces of the blind users who couldn't see the fire starting).
It turned out that some NiCd packs route the + and - through strips
of foil separated by only a thin layer of teflon tape. On overload or
heavy use, the teflon tape melted resulting in an internal short which
would then result in a dramatic meltdown. The interesting implication
being that even a momentary external short could cause an internal
short which could not be stopped. At that time, the battery pack
covers contained a polybromophenol fire retardent which while
preventing actual flames, resulted in an extremely unpleasantly
smelling smoke.

3906. Looking for February 1985 QST Magazine article

> went into his leg.

This can easily happen with NiCd battery packs. I will now proceed to relate an anecdote, followed by some suggestions... (nothing up my sleeve)...

Many years ago I was involved in the design of a wireless "auditory trainer", essentially a VHF FM hearing-aid for classroom use. It used an 8-cell NiCd pack. The battery was charged while in the trainer, and we included a diode in the charge path to prevent (catastrophic) discharge if a kid stuck a paper clip into the charging jack. We thought that we had covered all the bases as far as battery safety was concerned...

Well, we received a batch of Tantalum capacitors that tended to short-circuit after some months of use. The battery had a capacitor across it (after the power switch), and, perhaps triggered by the inrush current, the capacitors would short out, start smoking, catch fire, and melt through the plasitc case of the trainer.

Many of the hearing-impaired children who use this equipment have other disabilities as well. One child was confined to a wheelchair, having little or no mobility, with one of our radios strapped to his chest, when the radio proceeded to start smoking, then melting. Fortunately the teacher was able to remove the unit before the child was injured.

We (very quickly, believe me) identified the problem, and placed fuses in the battery packs. These worked, but did have a non-zero nuisance failure rate. At this time, the Raychem company was introducing a product called the "Polyswitch" (probably t.m.) This is the equivalent of a self-resetting circuit-breaker, or a very sharp-kneed PTC (Positive Temperature Coefficient) thermistor. We had Raychem make a unit that would fit into the battery case, and the problem was solved. I believe that it is still being used.

My recommendation: Remember that NiCd battery packs contain potentially catastrophic quantities of energy. Protect them against common fault conditions. I personally recommend the Raychem Polyswitch for this application. (I have no connection with Raychem).

OK, let's try it from my bedroom with a low-powered handheld, into my
favorite repeater:
"K5ZC monitoring."
If I haven't found a hot spot yet, all a listener will hear is:
"hissstorssssss".

Really useful. I probably won't get a response, and have learned
absolutely nothing.

>If you don't normally hear a tail on this repeater, kerchunking isn't
>going to get you anything anyway, so just listen for someone to answer.

How do I know whether it's worth it to move a few inches and try again?

>and ID at the end of it, that means when the testing is done, ID it. Since
>a series of kerchunks give you no more information that ONE does, you only
>need one, and you need to ID at the end of it.

Ah, but a series sometimes DOES provide more information, especially
with the "handheld on the fringe" scenario: you can find out where the
hot spot is. (No, it's not always where the receiver S-meter peaks, and
not all radios have S-meters.) The objective is to determine when you're
likely to get into the repeater; when you find that out, I agree that an
ID is necessary.

6950-7000 and 7300-7750 are surely allocated to other services, some of which probably no longer have so much need for this spectrum. But have they been consulted yet?

I am glad to see hams keeping, or getting, 300 khz of spectrum, and am also glad to see an expansion of the SWBC service in the portion of the spectrum. I would hope something like this goes through. We need to support it.

Now the tough parts. Do we just shift the band structure down 50 khz? What about extra class CW ops who's rigs won't go below 7000? Considering that the current band structure is based on the fact that most of the rest of the world has LESS, and if this proposal becomes the new allocation, they will have MORE (the same as the US) then we need to probably redesign the whole structure. I might suggest leaving the extra-only 25 khz righ where it is, and open up 6950-7000 for other things. This will depend greatly also on what other countries want to do. It needs to be done cooperatively once this proposal comes to be.

3912. Starting a car with NiCd's

Newsgroup: rec.ham-radio
Date: 1990-07-02 22:38:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500582@ux1.cso.uiuc.edu>
Source record: 10615

Has anyone ever tried starting a car with NiCd batteries? If you could validly assert that a certain number of cells of a certain size were able to start a car (even if they self destructed in the process) that might be significant enough to convince some people of the hazard.

Also, I am curious if anyone has ever tried to charge a regular (but low) car battery from alkaline cells. I would think it would require a number of them in series to get above the car battery voltage. Perhaps 10 D cells in series could, in the course of 1-4 hours, charge a car battery up enough to start it.

Then again, they do make those nifty solar cell battery chargers. They don't have much current, but a big one might get the job done, whereas the little one keeps the battery trickle charged if you don't leave your radio on.

3913. Carrying NiCd packs on airplanes

Newsgroup: rec.ham-radio
Date: 1990-07-02 22:45:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500583@ux1.cso.uiuc.edu>
Source record: 10616

Be sure to take EXTRA SPECIAL precautions when carrying NiCd battery packs aboard commercial aircraft. I would not want to see an FAA rule banning them.

I usually take a spare or two battery packs with me when travelling. I cover the open ends with a heavy plastic insulator, usually made from a expired credit card, and then wrap the whole thing in electrical tape to cover the charging terminals and hold the insulator in place so it cannot slide out.

I also do NOT use the insulators Periphex sent with my packs that says "battery may explode if shorted". Even if all the precautions are taken, some security checkpoint person is liable to prohibit them out of ignorance of all the work I did to prevent the problems, if they read that. So I just use a plain credit card plastic insulating tab. Besides, the ones I made fit much better anyway.

FYI, I have Icom HT's.

>wanted to try again to bring order (don't even think about it unless you
>have some power to back up your ideas), I will participate.

I'm afraid this is the unfortunate truth of the matter. The net control
will have to have full power into an omni. It wouldn't hurt if there
were a few other strategically placed backup net controls, such as in
Fla and Cal.

>I will NOT,
>however, be discourteous to ANY operator who signs his call, and that
>includes the barf boys who everyone seems to hate.

This is the right way to operate. It would only increase the chaos to
do otherwise. What is needed is a couple strong stations with the
discipline and skill required to run the net.

>It could be done again.

Maybe after I get my linear built. :-)

|> follow this rule so closely?

I think this is getting closer to the crux of the problem. The ARRL says that it is only providing what the members want in QST, and how can anyone argue with that?

Perhaps. But I think there's also some merit in the position that says that the League, as the primary organization of radio amateurs in the US, should also provide some occasional leadership by exposing its members to new ideas and technologies. It doesn't have to be 100% of QST, but it shouldn't be 0% either. But you'll never know if they'll be interested unless you try. Take a look at CQ-DL (Germany) or CQ (Japan). You don't need to read either German or Japanese to immediately see that neither magazine has anything to do with their American namesake. Just count the schematics!

Consider that American commercial television is also a product of the "we only give 'em what they say they want" philosophy. And consider also that cocaine dealers probably have a similar rationalization... :-)

From: nicholso@hpcuha.HP.COM
Message-ID: <22480003@hpcuha.HP.COM>
Source record: 10531

Hi. I've got some questions that maybe the net hams could answer, at least those with experience in CW. I'm new to this hobby and have been learning about and making some CW contacts in the HF bands. I hear all kinds of CW procedures being used, and am wondering what procedures are the correct ones.

I hear lots of variation in the use of things like:
- BT vs. periods for punctuation,
- one or two BT's at a time,
- R R R vs. FB,
- R R R before or after the callsigns,
- 559 vs 55N for the 2nd RST report,
- differing amounts of abbreviations,
- BK vs. BK TU vs. callsigns DE callsign KN,
- when to use AR (I've only heard it used twice),
- leaving out one callsign and just send DE callsign,
- just ending with BK and no callsigns,
- SK before or after the closing callsign,
- the dit dit at the end of contacts.

Also, could someone post or email me some transcripts of some basic CW QSO's, including things like a contest contact, a short DX QSO and a typical novice interchange (name is, rig is, ...).

3920. Scanner Antenna / Discone / Technical questions

Newsgroup: rec.ham-radio
Date: 1990-07-03 02:58:21 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Jul3.025821.8189@midway.uchicago.edu>
Source record: 10527
Cross-posted to: rec.ham-radio,rec.shortwave

I recently purchased a Discone scanner antenna from (ug) Radio Shack. This antenna has 8 horizontal radial elements and 8 radial elements at about a 30 degree angle with the vertical. It comes with a support tube and U bolts to attach to a mast or tripod but its pretty much free standing as it is for living room / portable use.

As far as performance goes - its much better than the rubber duck antenna on my Uniden BC100XLT. I pick up stuff clearly with the Discone that I can't even hear with the rubber duck - (esp useful when giving RST reports to your neighbors on their cordless phone transmissions - if you're in to that :))

But, its not better than my 45ft mult-band dipole. The discone is a bit "noisly" without a good ground connection. The dipole is clear as a bell but slighly less portable.

So thats that.

Here's the question(s)

1) The "users guide" cliams that the discone recieves 25MHz -> 1.3GHz. So what does this mean? A paper clip can recieve 25MHz - 1.3GHz. Is this hype or does it actually mean something ?

2) The claim is that it has a 1.5 SWR or better across 144,220,440 and 1296 MHz. Anyone use the Discone for transmitting ? How well does it work ?

3) I have a handfull of books on antennas but none discuss an antenna quite like the Discone. Can someone tell me qualitatively how this antenna with its double set of 8 radials "works"

Thanks
Gary

Cross-posted to: rec.ham-radio,rec.shortwave

I picked up a copy of the ARRL Operating Manual(copyright 1988). On page 2-17 there is some discussion of the NCDXF worldwide propagation beacon network on 14.100 MHz.

There are 9 transmitter sites - in NY, CA, HI, Japan, Israel, Finland, Madeira Island, South America and Buenos Aires. These stations signon and transmit for 1 minute each on power of 100 watts down to 1/10 watt. Each station takes its turn - 1 minute each - 9 stations - with the last minute silent. This cycle of 10 minutes repeats.

So says the ARRL Operating Manual. However, I've tuned into this 14.100 net for several days now and at various times and really haven't heard anything but background noise. I'm using a Kenwood TS-140S with a 45ft multi-band dipole. I can hear plenty of DX out there so I very much doubt its my radio - here in Chicago.

==> The question is this. My ARRL guide is from 1988. Is this beacon still
==> in operation ?

==> Also, I'd be very much interested in any other such propogation nets on
==> other ferequencies - or how people generally get "dynamic" propagation
==> information (ie other than looking at published LUF,MUF charts)

Thanks,
Gary

>the hazard...

In the '60s there were LOTS of wet-cell NiCd batteries available, surplus from obsolete Nike Ajax surface-to-air missiles. Their energy density was somewhat less than that of modern NiCd's, but they could supply enormous current for a short time. I went caving with some guys who used those to power their lights. Their Volkswagen's 6-volt battery was dead when it was time to go home. We were wet, and it was well below freezing. As our clothes began to solidify, we disconnected the car battery, paralleled two (partially discharged) 6v surplus NiCd batteries, connected them to the car, and the engine started! NiCd's work better than lead-acid at low temperature. It didn't seem to hurt the batteries.

Before we go off the dep end with this, keep in mind that the original
posting is about one working group _advising_ on what the US position
should be. (And my information is that the agreement within this
WG is less cast in concrete than might have been implied.) There are
other WG's with differing ideas, and the US position will be an amalgam
of the recommendations of these various groups (and other influences).
So we are a long way from seeing this made into an official US position.
And even if that happens, that's one vote among many countries at the
WARC. Not only aren't the chickens hatched, the eggs aren't even laid yet.

(Still, we can dream, can't we? :-)

Here's the straight story. It comes from a friend of Jim's family who got the news from Jim's uncle.

Jim passed away at the mic while working DX. The cause of his death was NOT caused by electrocution as was previously rumored. Apparently he died of a heart attack. Approximately 3 days after he died, he was found in front of the 781, log book page half filled, radio still on, etc.

That's the whole story.

One thing that hold back increasing more of one type of article is expense.
Having a special tear out section with different binding is going to be
even MORE expensive. So you can figure that with the same budget, you
would get LESS articles.

Yes, it means something. According to the ARRL Antenna Book, 15th edition,
"A discone antenna acts as a high-pass filter. Below some cutoff
frequency, the SWR will increase rapidly. Above this frequency, the
antenna SWR remains low up to a maximum of 10 times the cutoff frequency
value, depending on the design proportions."

> 2) The claim is that it has a 1.5 SWR or better across 144,220,440 and 1296

Just yesterday I talked on the phone to a fellow in central PA who is
using one on 220. He seemed to be having success with it. I've heard
of other people using it, too.

> 3) I have a handfull of books on antennas but none discuss an antenna quite

It's described in the ARRL Antenna Book, both 14th and 15th (the newest)
editions. The 15th edition devotes 5 pages to it. Maybe you have the
wrong antenna book :-)

OK, I can accept a "this is KA5XXX testing to find the "hot spot" for
my handie scratchie", but repeated and continuing unmodulated kerchunking
followed by BLEEP-BLOOP all day long wears the nerves of monitoring stations
VERY thin. It seems that nearly every operator MUST do this EVERY time
he turns on his radio. You can stand up at club meetings and ASK that
they don't do this, but still it continues day in and day out. The
ONLY thing that seems to stop this kerchunking is to take away the feedback
by going to no squelch tale.

Send one R only
>- R R R before or after the callsigns,
Send one R only either after your callsign or immediately
after the other station sends BK. IMPORANT! Send R only
if you recieved everything without error. Nothing ticks me
off more than the following:

NK2D de KA4XXX R R R FB OM AND TNX FER INFO
BUT MISSED UR NAME AND PSE RPT MY REPORT AND
YOUR QTH.

GRRRRR!

>- 559 vs 55N for the 2nd RST report,
Either way is OK
>- differing amounts of abbreviations,
The more the better
>- BK vs. BK TU vs. callsigns DE callsign KN,
Both are OK, but you should get in the habit of using BK
instead of identifying each time. The rules require identification
every 10 minutes, so sending BK instead saves time and leads to
a more conversational qso. BTW, why add the kn after your callsign?
you should just use k, especailly on domestic qsos.

>- when to use AR (I've only heard it used twice),
At the end of your transmission prior to sending:
KA4XXX de NK2D K

>- leaving out one callsign and just send DE callsign,
This practice is OK.
>- just ending with BK and no callsigns,
See above. This is generally best.
>- SK before or after the closing callsign,
SK goes after the callsign.
>- the dit dit at the end of contacts.
This has become quite common and is OK.

>
>Also, could someone post or email me some transcripts of some basic CW
>QSO's, including things like a contest contact, a short DX QSO and a
>typical novice interchange (name is, rig is, ...).

Try to get a hold of the arrl operators manual. It is basically
sound and has a listing of useful cw abbreviations and Q signals.

I am using a RS discone on both 2 meters and 70 cm. The SWR is about
1.1 on both bands. It works well. The gain is, of course, no better
than a dipole (possibly a little worse), but I am able to work a
repeater 70 miles away with 2 watts.

The antenna was designed many years ago and I believe first produced by
Hy Gain, but I don't see them advertising it any more.

]ID is necessary.

Actually, there is a problem with this. When you are hunting for hot spots, you are listening on the receive frequency. But... you need a hot spot for the transmit frequency also. Since hot spots are usually caused by multipath, the transmit and receive hot spots are often not in the same place. Most repeaters don't give you any indication of how strong your ker-chunk is. Micor's, I notice, do give you some hint - the squelch tail is slightly longer on a weak signal.

>
> ----------

Bob,
I agree that we need to keep technical interests in view of the masses
who don't yet know about them but it seems to me that we will have a hard
time getting both general and in-depth coverage in a single publication
of high circulation. Circulation and the resulting advertisement seems
to buy the pages. It may come down to "how much money does the
'technical amateur community' spend?".
I'm wondering if we (those of us desiring greater technical content) don't
need to band together a bit and support something. That was my reference to
QEX in a previous posting. I'm not partial to one medium over the other
at the moment, I just think we need to act as a group in support of
something.
I would love to see QEX (or what ever other forum becomes the main
technical one) become something *other* than a minority publication.
As far as I can tell Paul Rinaldo would too, but I can't speak for him
or the ARRL board.
I think I may myself be guilty of adding to the problem. The discretionary
money I spend into amateur radio pursuits tends to be for components
and materials rather than products from the main amateur manufacturers.
I'm not sure that my activities pay for many magazine pages. I probably do
pay more attention to QEX "fringe" advertisements than QST glossy ones.
Maybe if enough of us support a coomon forum those "fringes" can support
a significant number of solid technical pages. I hope so anyway.

The kenwood is the better rig, but don't take my word for it. Check out Passport to workd band radio, or other reviews that pit the two. I have a kenwood 440, the same thing only with transmit. Have had it for 4 years, and you could not give me the equivalent icom.

Icom used to have passband tuning, but they removed it from the current version of the R-71. This is a very needed feature, and without it you might as well keep your 2010 (I have one of those also, and like you I upgraded, but still use the sony for some listening).

The kenwood has MUCH better audio. Especially if you run it through an amplifier, or hook up an external speaker. The icom sounds like a bucket of tin.

The icom is touted as a DX machine. DX'ers do not care about audio quality, they just want an ID. BUT without the passband tuning, I think the icom suffers even in that aspect.

Kenwood calls their system IF shift. It works just beatifully. I have used it (In combination with usb) to pull out Pirate Stations that would have been lost on a rig without it.

There is no contest at all. The KENWOOD is the winner.

Most of the "technical" articles have been a how to build it. While there needs to be such articles, I think people will only become interested in technical articles if those articles provide new understanding of the issues. When I was just entering the field, I wanted, and looked everywhere, foor articles that explained how the design was derived. Not just why a bypass capacitor was used, but how its value and type was determined. When I want to build something, I don't go out and buy the exact parts and create a clone. Usually I want some mods and to use some parts that are available from cheaper sources. Without an understand of the real design techniques, indescriminate part substitution will most likely lead to project failure and loss of interest in designing and building your own equipment.

Discones work just fine for transmitting. The only problem is that because they're so broadband, they will gladly radiate any and all harmonics and spurs generated by your transmitter -- no "free filtering" at the antenna.

>of them in series to get above the car battery voltage. Perhaps 10 D cells
>in series could, in the course of 1-4 hours, charge a car battery up enough
>to start it.

I have done it twice. I built a portable computer (Z-181 laptop +
Telebit Trailblazer plus + Motorola 8000 series cell phone portable +
17 "D" (Radio shaft 4 AH nicads) a couple of years back. Left the
flashers on for 45 mins on my '90 Pontiac Transsport once..After being
used to a DieHard for years, I didnt realize how weenie those modern
sealed Delco batteries are these days. All the solenoid did was chatter.
Let stand with no load for 15 mins.. same thing. I patched up the
battery back from the suitcase terminal to the cigarette lighter, and
put a 12V 55W halogen bulb in series with it (around 21V on the terminal)
This "charged" the car battery at a couple of amps or so.. In 5 mins,
it started on the first try.

2nd time battery was totally dead (left the dome light on)., Did the same
trick, but let it charge for 45 mins and started fine.

I have heard of a form of lithiums (thoicynional?? sp?), which can short
circuit in the hundreds of amps. Four "C" cells can start a car.
They are not available to the public for obvious reasons.

Well, dying at the mic is really dramatic - the kind of stuff that the Hollywood "glop factories" make mega-buck movies out of.

I just hope we don't have some morons come around and say that MFJ did it out of revenge. That would really be a sick suggestion......

So long V31BB - hope you're in ham heaven!

From: paul@hpldola.HP.COM
Message-ID: <12120040@hpldola.HP.COM>
Source record: 10538

I have one of the Maxon ear-mic tranceivers. The ear-mic is very convenient when the external noise is low. When high it can trigger the VOX and cause all sorts of grief. The Maxon literature suggests these things are OK for use in high-noise environments like airport areas - used *underneath* the approved hearing-protection headsets. I haven't tried it but it should work fine.

3941. A primer on grounding

Newsgroup: rec.ham-radio
Date: 1990-07-03 18:18:38 UTC
From: gary@ke4zv.UUCP
Message-ID: <827@ke4zv.UUCP>
Source record: 10559

Grounding Techniques for Radio Installations
by Gary Coffman KE4ZV

There are three main reasons to ground radio equipment.

1. Safety grounding to protect operators from accidental
electrical shock.
2. RF grounding to prevent spurious and harmonic radiation
and to enhance antenna efficency.
3. Lightning protection.

Each of these require different grounding technique. A careful analysis
of the ground methods used is required to determine if all three objectives
are met.

Safety grounding is in many ways the easiest criteria to meet. Simply
bonding all equipment cabinets to the power company ground with conductors
of low resistance and adequate current carrying capacity to blow the
circuit breakers will meet safety requirements.

Effective RF grounding is often much harder to achieve. The ground
path must not offer any significant impedance at the frequencies of
interest. Since the frequencies of interest are often octaves apart,
this is challenging. The frequencies of interest are the fundamental
frequency of the transmitter, the harmonic frequencies of the transmitter,
and any spurious frequencies the transmitter may generate. The latter
is usually the toughest.

Grounding for lightning protection is difficult due both to the
magnitudes of the voltages and currents involved and to the fact
that the lightning waveform is a step function and has considerable
RF energy.

Probably the WORST problem one faces in designing an effective
grounding system is the prevention of GROUND LOOPS. Ground loops
will cause unintended currents to flow in circuitry, often with
disasterous effects. Either damage or degraded operation will
inevitably be the result of a ground loop.

The best method of securing a good ground for a radio installation
is to use a GROUND WINDOW. The ground window technique requires
that every cable that enters or leaves the radio room pass through
one small area where all ground connections are made.

The power company ground must be bonded to the ground window and
surge suppressors such as those marketed by Lightning Protection
Associates should be installed in series with the hot wires. Note

that simple shunt protectors will not be sufficient to protect the equipment in the event of a direct lightning strike. Series protectors are designed to open the circuit under severe overload.

All coaxial cables must have their shields attached to the ground window and have their inner conductors clamped with an arc cartridge designed to fail shorted. In addition the inner conductor should be fused in a manner that will open the line when the arc cartridge fails.

Telephone cables must enter through the ground window and have their leads clamped with MOVs and arc cartridges that are designed to fail shorted. In addition all leads must be fused in a manner that will open the line when the arc cartridge fails.

Each piece of equipment in the radio room must be attached to the ground window by a wide heavy strap installed so as to be as short and straight as possible. Neatness definitely does not count here. Don't "dress" the ground cable, make it short and direct. Do not "daisy chain" grounds. Make sure that the only path from one piece of equipment to another is via the ground window. This means that interconnecting shielded cables should go from the equipment out to the ground window, have the shield bonded to the ground window, then return to the next piece of equipment. This is the only sure way to prevent circulating ground currents.

Now that every piece of equipment in the radio room is at the same potential as the ground window, the ground window must be brought to true earth ground. This is fairly easy for DC and low frequency AC, just make sure the cable is heavy enough to have the smallest possible voltage drop across it. For RF, inductance and resonance effects must be considered as well as skin effect. A wide flat copper strap that is routed as straight as possible to earth ground is preferred. For maximum lightning protection, the ground strap must never travel upward because the space charge will resist the current flow. Sharp bends will act as single turn inductances and should be avoided. Since a single ground cable will exhibit resonance at certain frequencies due to it's length, several ground cables should be used with each a different length. The lengths should be chosen such that a cable that is near a quarter wavelength at a given frequency will be paralleled by a cable that is near a half wavelength. In practice, several cables varying from the shortest possible length to twice the shortest length should be paralleled so that at least one will present a low impedance at any frequency. Do not coil the longer cables, instead fan them at the center point.

The method used to route cables down the tower will effect the degree of lightning protection achieved. If possible use a plumber's delight type of antenna that is dc grounded to the tower. Route the coax down the inside of the tower, and ground the shield of the coax to the tower at several points. This last will short out the single turn transformer formed by the tower

and the shield of the cable. Unless this transformer is shorted, currents flowing in the tower to ground will induce currents in the shield of the coax.

The true ground must be more than a single stake driven into the earth. If the tower is ground mounted, use the base of the tower as the center of the ground field, otherwise drive an eight foot ground rod to form the center point of the ground field. Run radials out from the center of the ground field to a buried loop connecting a series of ground rods separated from each other by no less than eight feet. A minimum of eight rods should be used. If possible, the radials should continue outward for one quarter wavelength at the lowest frequency of operation. If your tower is not ground mounted, bring it's base ground back to the ground window using multiple lengths of cable as discussed above. Do not run a ground cable directly from the isolated tower to the true ground or a ground loop will surely be created that can allow damaging circulating currents to develop.

This all sounds like a lot of work and expense, but field experience has proven that a system like the one described will withstand direct lightning hits without loss of equipment, air time, or lives.

3942. KA9Q installation on MFJ 1270

Newsgroup: rec.ham-radio
Date: 1990-07-03 18:31:37 UTC
From: wjh0265@helios.tamu.edu
Message-ID: <6319@helios.TAMU.EDU>
Source record: 10543

I was thinking about installing the KA9Q net pkg. for an MFJ 1270 with 1.1.2 ROM. I was going to burn a new ROM with the patch supplied with the pkg., but I have heard there is a new ROM available that may make that a moot point. I would like dual operability for standard AX.25 and KA9Q. I downloaded the stuff from louie.udel.edu, but it seems to be the same stuff I saw there 2 years ago. Is there new code and docs elsewhere that I don't know about? Any help would be appreciated!

3943. Standard C528 Twinbander? Experiences?

Newsgroup: rec.ham-radio
Date: 1990-07-03 19:31:21 UTC
From: hks@funet.fi
Message-ID: <1990Jul3.193121.6767@funet.fi>
Source record: 10545

I've been offered by a local ham dealer (ELSTAR Oy) a Standard (Radio Co) Model C528 "Twin bander" which has more features than I have seen in others (ICOM-24ET, YEASY-470,Kenwood-75E) like dual/separate SQL,VOL,displays (including S-meter and memories), dual speaker jacks (maybe I could put TNC on main band and listen the other?), scan functions etc. Also it's supposed to have CODE scuelch/paging, tone scuelch (option), lots of scanning, dual watch etc. functions (a la ICOM) with wide extended coverage, PTT lock, Freq lock, squeclh off, APO etc. Only receiver specification is the sensitivity of 0.16uV at 12dB SINAD which sounds good. Of course it's also supposed to provide 2-5W, fit in to pocket and be raindrop proof. Price is a bit more expensive than ICOM, Heath or YEASY but so is nearly everything here due to low volumes and high taxes :-(

What I'd like to know has anyone any real experience on this Unit (or Standard in general). Can you trust it (them?)? Is it high quality and rugged construction? Any caveats? I or my friends have hardly even heard of the company and I've seen only a very small announcement in a UK ham paper but not in any major ones etc. Also the English grammar is horrible in their brochure (even to a non native speaker :-) although I don't hold that as an evidence of a bad product but bad marketing. Am I missing something or have most others missed an excellent dualbander?

Regards,

Harri Salminen

3945. Re: Homebrew repeater controllers

Newsgroup: rec.ham-radio
Date: 1990-07-03 19:59:12 UTC
From: brian@ucsd.Edu
Message-ID: <14954@ucsd.Edu>
Source record: 10546

People stop kerchunking the repeater when
a) they own radios they trust never to break
b) they use a repeater they trust never to break
c) you kill them
d) the repeater drops off the air so fast they can't hear the kerchunk

Which do YOU think is the most achievable?

(Recall that if you have a real radio, IT won't make any noise when the signal comes and goes either, so if the repeater also lacks pinball machine noises, it could be kerchunked all day long and nobody'd care.)
- Brian

3946. Re: Technical articles

Newsgroup: rec.ham-radio

>Most of the "technical" articles have been a how to build it. While there
>needs to be such articles, I think people will only become interested in
>technical articles if those articles provide new understanding of the issues.
>When I was just entering the field, I wanted, and looked everywhere, foor
>articles that explained how the design was derived. Not just why a
>bypass capacitor was used, but how its value and type was determined.

Giving that level of detail would put a severe limit on project complexity
given that they can't devote a whole issue to one article.

Usually they give you some clues such as "the next stage is an emitter-follower"
which you can then look up in the Radio Handbook or some other text
for generic parameter info.

Another explanation is that the size and type was determined by the author's
junk box. The author has developed a "feel" for what works for af or
rf bypass, etc, but is not up to a quantitative analysis.

On the other hand, if the author says that xxx or anything in the
range yyy-zzz will work just as well, and hasn't actually tried them, he
may end up with a bunch or irate letters if it doesn't work for some
unforseen reason.

> When
>I want to build something, I don't go out and buy the exact parts and create
>a clone. Usually I want some mods and to use some parts that are available
>from cheaper sources. Without an understand of the real design techniques,
>indescriminate part substitution will most likely lead to project failure
>and loss of interest in designing and building your own equipment.

For beginners, I think it would be best to build a couple of projects
as described. Then try some "educated" substitutions to see how it
changes things.

[trouble about subscribing QEX]

Since I have had trouble subscribing QEX, and so far nobody mentioned the address (which took me a month to get), I guess it is appropiate to give some data:

ARRL, (yep, that address isn't easy to find in Europe, I'd better include it)
225 Main Street, Newington, CT 06111 USA
Phone +1 203 666 1541, FAX +1 203 665 7531

I have had trouble getting the subscription money over to the ARRL. The person who helped me (thanks!) was Chetty Tardette. You might want to contact her for difficult situations (overseas, etc).

Subscription rates:
USA third class mail: member $10, nonmember $20
USA, Canada and Mexico first class mail: member $18, nonmember $28
Elsewhere Airmail: member $38, nonmember $48

I hope this is sufficient. Disclaimer: I am just subscribed to QEX. It took me quite some time to get this info. Maybe it helps others under similar circumstances.

Kenwood TS930 Problem

(I am posting this for Jim-W9NB but you should direct
replies either to me or rec.ham-radio)

KENWOOD TS930 PROBLEM
I have been having an intermittent problem with tuning...
the frequency will not change with inputs from the main tuning
control knob. I can turn off the unit and come back to it later
and the problem disappears! I have tried touching up through-
holes on the synthesizer board but the problem reappears
about a month later. Does anyone have any ideas? The
control processor may be getting into the act. One friend
suggested I reset when I see the problem.

Thankyou,
Jim-W9NB

In article <1990Jul3.030049.8312@midway.uchicago.edu> gary@ellis.uchicago.edu (gary buchholz) writes:
>I picked up a copy of the ARRL Operating Manual(copyright 1988). On pages
>2-17 there is some discussion of the NCDXF worldwide propagation beacon
>network on 14.100 MHz.
>==> The question is this. My ARRL guide is from 1988. Is this beacon still
>==> in operation ?

They sure are. In fact, the Stanford beacon now operates on three bands. When it finishes on 20m, it switches to 21.150MHz. Then during the next minute, it's on 28.200MHz. Then it's silent until its next turn on 20m.

Herewith the full scoop (obviously Gary has it, but others might appreciate the information):

**********(cut here)**********

Here's a list of the beacon stations supported by the Northern California DX Foundation on 14.100 MHz.

Schedule: Each beacon occupies a one-minute time slot on a rotating basis with the others. For example, 4U1UN/B at the U.N. headquarters in New York City is on the air at every "0" minute; i.e. at the top of the hour, at 10 minutes after, at 20 minutes after, etc. As yet, there is no beacon in the "9" slot.

Output sequence: Each message begins and ends with a CW id at 100 watts. In between, the beacon broadcasts a series of continuous tones at 100, 10, 1, and 0.1 watts.

TIME CALL SIGN LOCATION
00 4U1UN/B New York
01 W6WX/B California
02 KH6O/B Hawaii
03 JA2IGY Japan
04 4X6TU/B Israel
05 OH2B Finland
06 CT3B Madeira Island (off NW coast of Africa)
07 ZS6DN/B South Africa
08 LU4AA Argentina

Also, at 02, the W6WX beacon broadcasts on 21.150 MHz. At 03, it transmits on 28.200 MHz.

Reports: The DX Foundation is eager to get reception reports. They've even worked up a way for individual stations to best evaluate day-to-day

propagation changes. (It's based on assigning numbers to the different
power levels and adding up the total you can hear.)

For more information, contact the Northern California DX Foundation,
P.O. Box 2368, Stanford, CA 94309. I'd suggest you put "Beacon Info"
or some such on the envelope so it will immediately be routed to the
beacon manager. You can also request information about the Foundation's
other activities (such as DXpedition support and free slide shows).

Happy beaconing!

Patty N6BIS

**********(cut here)**********

>There are 9 transmitter sites - in NY, CA, HI, Japan, Israel, Finland,
>Madeira Island, South America and Buenos Aires.
^^^^^^^^^^^^
I think you meant "South Africa" there, unless Buenos Aires has moved
and can no longer be considered part of South America. :-)

>==> Also, I'd be very much interested in any other such propagation nets on
>==> other frequencies - or how people generally get "dynamic" propagation
>==> information (ie other than looking at published LUF,MUF charts)

There are about a gizillion 10m beacons, but I'll let someone else
discuss them because I don't have the list.

From: cb@cci632.UUCP
Message-ID: <38479@cci632.UUCP>
Source record: 10563

After reading some of the comments about fm vhf contesting, I was
compelled to say a few words. FM only is not dead here in WNY,
Fn02/03/12/13. The local vhf/uhf group has resurrected this
mode of operation. As a club they have provide incentive for
contacts by providing competion between groups and individuals
for FM only competition.
For example I made about 255 QSO's on 2.5 bands FM (my 220 was getting
into the local 442.0 machine) and came in an astounding 4th place!
(which was embarassing since I came in 3rd the previous year :-).
The local DX club won top honors for the second year in the interclub
competion (not bad for bunch of 2m maybe kind of guy :-).

Anyway to make a long story short, those fm contacts do help the club,
at least from looking at the January results.

Maybe next year I'll have 4 bands no better have 5 Rich just added
20 more feet to his tower :-).

FM contesting is FUN, thanks Rochester VHF group....

My mistake. Apologies to both you and Glenn.

>Also, from conversations with HR staff, including
>Skip Tenney, I was under the impression that HR's sale was due to Skip wanting
>to retire and had nothing to do with advertizing revenues. If you have other
>information I would like to know (please quote your sources).

No, I have no such data. Just idle musing. I thought that would be obvious from the fact that my diatribe ended with the call for a class action suit against the advertisers who did not place ads in Ham Radio.

Maybe a :-) or two would have helped. :-)

[Sorry to bother the net with this. Both the flame and the reply would have been better handled by private e-mail, but having been chastised publicly, it seems that a public reply is in order.]

Now back to the business at hand. What would get us off top dead center regarding the proposal to publish technical articles here (including graphics, schematics, etc.). Would uuencoded GIF files do the job? (or would it be too large?) Is a DOS based reader readily available? Once the DOS based reader is available, the Amiga and X11 people will follow.

Another pertinent question, I think, is whether the authors normally make enough money off their articles that the lack of remuneration would be a deterrent. Or is the payment small enough that it is just a formality that authors would be willing to do without?

I think exposure would be no problem. Already articles from this newsgroup make it onto Fido/Opus, packet (ax.25), and TCP/IP. Hopefully these would too. I think we would then be reaching a good portion of the technically active hams.

Or is the net happier with discussion of ordering pizza over the repeater's phone patch?

Start a car? No. But I have been present for the starting of
a Mitsubishi MU-2, which pulls about 2000 amps at 24 volts during
the start cycle. It requires spinning the single shaft turbine
and the coupled prop up for a suprisingly long time before the
engine is ready to run. As I recall, it used wet cell NiCad batteries.

Even the little X sized (slightly larger than D cell) lead acid
batteries will give a lot of current. At a trade show, it was claimed
that 6 of them would start a car. (Yes, they deliver 100 - 200 amps.)

Alan

Jon,
Are you the only one from HQ who reads this net?

It might be interesting if some of the folks there saw some of these
opinions/flames/catterwallling/etc/

Hope you get a nibble!

> From: TILDE::"nicholso@hpcuha.HP.COM" "Ron Nicholson" 3-JUL-1990 17:25:05.78
> Subj: Some CW procedure questions

Ron,

Good luck with it. PROCEDURE is really intended for formal situation, like emergency traffic anmd directed nets. What you find ON THE AIR is more in the realm of CUSTOMARY.

If you have access to ARRL books, I would recommend "The ARRL Operating Manual" and "Operating and Amateur Radio Station". Both give formal and informal examples.

Here, I have commented on your question, to the best of my awareness. As a code instructor, I try to at least keep aware of what's going on out there.

I am sure you will get other responses, and I hope this and those will help answer your questions.

> I hear lots of variation in the use of things like:
> - BT vs. periods for punctuation,
BT is a "double dash" and might be analogous to an "uhhhh..." is speech. It is supposed to be a separator between segments, but some folks send BT just to waste time until their brain catches up with their fingers. Punctuating takes a little thought. It sounds formal, too. BT sounds quick and informal, and is nice and easy to send.

> - one or two BT's at a time,
They really can't think of what to say.

> - R R R vs. FB,

Partly as before, while gearing up thinking what to say, some folks send R R R just to waste time. One is probably enough. Imagine on voice, someone saying "I heard you, I heard you,..." over and over.
R means "RECEIVED" and kind of informally, "ROGER" (acknowledged),
FB is abbreviation for FINE BUSINESS (?) which must be a pretty old expression, and only used in radio; I've never heard it in any other context. Think of it as an adjective describing the state of mind of the other operator; he is hearing you well and is happy to talk to you... (I suppose!)

Saying R FB (or worse, R R R FB) is redundant. But you hear it again and again...(sorry about that!)...on the air.

> - R R R before or after the callsigns,

Again, wasting time, getting the brain up to speed with the fingers.

> - 559 vs 55N for the 2nd RST report,
Shorthand. N for 9. You'll also hear 5NN.

> - differing amounts of abbreviations,
I have a list I will mail you, copied from ARRL lists and other sources.
If you get other lists from elsewhere, I would appreciate a copy to merge
with mine, because I sometimes send them in code practice sessions at the
radio club here.

> - BK vs. BK TU vs. callsigns DE callsign KN,
BACK (sometimes read BREAK if quick exchanges are happening) generally
BACK with the TU meaning TO YOU.
CALL SIGN DE CALL SIGN is full-out you-from-me identification, with the
KN meaning GO-ONLY, the QSO is not meant to be broken into.

> - when to use AR (I've only heard it used twice),
QSOs? Maybe never. It is a formalism. It is used to mark specific END OF
TRANSMISSION in formal third party traffic and in Net operation.
When you're rag-chewing or contact chasing, it's probably not really
necessary.

> - leaving out one callsign and just send DE callsign,
Shorthand. You really only have to send your OWN call sign.

> - just ending with BK and no callsigns,
Shorthand. You really only have to identify every 10 minutes and at the
end of the contact, so BK (BACK or maybe BREAK) just passes
it back to the other person.

> - SK before or after the closing callsign,
SK means END OF CONTACT. (BTW it is one of the prosigns REQURED in the
FCC/VE code exams, along with AR and BT.)

> - the dit dit at the end of contacts.
Silliness... Shave-and-a-haircut, Two Bits. That's how it started, and
has sort of degraded to just the dit-dit.

> Also, could someone post or email me some transcripts of some basic CW
> QSO's, including things like a contest contact, a short DX QSO and a
> typical novice interchange (name is, rig is, ...).

REMEMBERING that the PROSIGNS, BT AR SK AS KN, are run together as
one character, =***= not =*** =, etc.

(I hope if these call signs exist, the holders won't mind!!)

CQ CQ CQ DE WA8YCD WA8YCD WA8YCD K

WA8YCD DE KY2D K

KY2D DE WA8YCD R TNX FER CALL BT
UR RST 589 BT
QTH MORGANTOWN, WV BT
NAME BOB BT
RIG HR IS DRAKE TR4C ES ANT DIPOLE UP 34 FEET BT

WX HR IS SUNNY AND WARM, TEMP ABT 80 DEGREES BT
JUST THOT I WUD SEE WATS ON THE BAND THIS MORNING HI HI
SO WAT SA? N2EFG DE KA1BCD K

etc....

If conditions were marginal, you might send the RST, your NAME, and QTH twice, but at slow code speeds if it is not necessary, don't make the other OP wait through it.

The other operator may ask for repeats. You may also have to ask for repeats if (QRM, man-made) or (QRN, natural) interference or changing band conditions (such as fading, QSB) keep you from hearing the entire transmission.

VERY IMPORTANT! Send your CQ and generally everything, at the speed YOU want to copy! Don't blame the other OP for sending back too fast if you send that fast too!

QRS (send slower) when asked to, and don't be afraid to ask the other OP to slow down if you are missing too much!

Contesting is a different matter on exchanges... you might hear all kinds of short cuts.

BTW, "CQ TEST" has come to mean "CQ CONTEST", not TEST as in experiment.

CQ FD CQ FD DE WA8YCD WA8YCD K
WA8YCD DE KY2D K
KY2D DE WA8YCD TU 1A WV BK
DE KY2D QSL 1A WV TU 2A NNJ BK
DE WA8YCD TU GL TEST SK

Listen. Not all contesters are doing the same thing, some work faster and hear more distinct calls out of a pile-up and shortcuts work. But if in doubt, pick an exchange that makes sense to you and stick with it.

Some contests have specific formats. Check the magazines for how those work.

I'll look at my Code Practice files and see what else I can send you.

When in doubt, use CUE CARDS (Just like on TV!!)

I recommend to new hams that they write out on a sheet of paper in large, friendly letters the information they would like to send to the other station in a QSO. Such a "script" or "Cue Card" can help you when you can't think of what to say next. After a while, you relax with it and can get rather chatty.

When you can relax, you start enjoying the CW QSO and it becomes a transformation into a language, not just a code.

Good luck!

3960. Conversation with K2EEK, Editor CQ Magazine (Long)

Newsgroup: rec.ham-radio
Date: 1990-07-04 04:18:31 UTC
From: ornitz@kodak.kodak.com
Message-ID: <1990Jul4.041831.24933@kodak.kodak.com>
Source record: 10562

After reading a number of replies to my comments about the demise of Ham Radio Magazine and my dissatisfaction with CQ magazine, I decided to call Alan Dorhoffer, K2EEK, the editor of CQ Magazine and ask him to elaborate on the editorial in the June issue of CQ. I felt that Alan's editorial and the message from CQ's publisher, Dick Ross, K2MGA, were quite negative regarding the technical aspect of amateur radio. Quoting a few of their comments:

CQ for the last 10 1/2 years has worked very hard to carve our a niche among today's amateurs. By todays amateurs, I mean those who are operator oriented and somewhat less technically geared. K2EEK

But the technicians among us no longer provide the numbers needed to support a monthly magazine of the caliber of Ham Radio. K2MGA

What changes are we likely to see within the pages of CQ? Probably not too much that you'll notice at first glance other than increased size. K2EEK

We agreed to the concept of integrating the circulation files of the two magazines, and to the broadening of the editorial scope of CQ to include more technical material, although it was clear that the very highly technical characteristic of the early Ham Radio would not be suitable for the combined audience of CQ and Ham Radio. K2MGA

There will be no fundamental changes in what has been CQ, right down to the food reviews. K2EEK

Obviously, we'd like to add more small projects for you to build (and use), and Ham Radio has always had interesting projects for an evening or weekend. K2EEK

These comments are illustrative of the overall tone of CQ after buying out Ham Radio. As someone who loves the technical side of the hobby, I was disgusted that the next three years of my subscription was going to buy a magazine whose editor and publishers felt this way.

At this point, I decided to call Alan, K2EEK, at his office. We spoke for what seemed well over an hour on 6/28 in the afternoon.

I was really quite surprised with some of Alan's comments and asked if I could pass them along to the net, to which he agreed. Alan, unlike the various ARRL officials I have conversed with over the years, was quite articulate while "pulling no punches" with his answers.

The word I would best describe Alan by would be a BUSINESSMAN. CQ magazine is there to make money. Period! While Alan enjoys amateur radio and

running the magazine, it is still a business which must be profitable if he is to remain employed. Buying Ham Radio was a business decision based mainly on what the distribution outlet of Ham Radio Bookstore could bring to CQ Communications, Inc. Ham Radio Magazine really was secondary to the decision. Alan felt that Ham Radio Magazine was basically unwanted; the magazine was ailing to begin with, and that CQ would never publish the highly technical articles like Ham Radio did for fear of losing existing CQ readers.

He made this point quite clearly: "the reality is that the world has changed." Ham radio is dominated by the appliance operator and those few technically minded hams left are a small majority. His magazine is there to serve the needs of the masses, not the majority. He added that while CQ might become somewhat more technical, the changes would be very slight.

What was surprising to me was that Alan too mourned the loss of this technical competence in our hobby. He would like to see hams doing more technically challenging projects, but since they are not, CQ will be aimed for the non-technical audience. He said that right now, hams need to learn more about operating procedures, and rules and regulations. Alan lamented the fact that one could pass an amateur exam by passing only the technical questions and missing every question on Rules & Regulations.

I asked Alan about a code-free license and whether he thought it might attract more technical people to the hobby. He answered that it probably would not - that the same percentage of technical people would be hams before and after adding a code-free license. The hobby would certainly grow but it would be basically the same mix of people - only larger. There would be no fundamental shift toward the technical side of the hobby.

{To insert my opinion here, increasing the number of techies might cause some aspects of the hobby, such as digital communications or microwaves, to reach critical mass. Here you need more of the right people, spread across the country. If the larger numbers can be found by keeping the same percentage of a larger total, the effect will be the same as getting just a smaller number of the right folks. However, other problems such as HF and repeater crowding are functions of total numbers. Alan made mention that to keep our government happy, ham radio must create enough jobs and business capital if we are to keep our privileges. We need larger numbers for this.}

I changed the subject back to the needs of the technically oriented ham and what possibilities Alan saw for us. He said that there was always QST, of course, but that the League was also aiming their magazine to the masses and that the masses were NOT technically oriented. He pointed out that QST had several advantages because they were not solely driven by subscriptions and advertiser revenue, and that they were a non-profit publication. Because of this, QST could afford to run an occasional article that would appeal to a specialty audience. CQ could not afford to do this. This is an important point made by several USENET readers. We should continue to encourage the League to run these articles in QST. As someone has pointed out, such articles may attract new people who had not been exposed to the

more technical side of the hobby. Alan then said that he felt Wayne (Green) would fold his magazine soon (73). He agreed with me when I commented that I and many other people felt that there was no professional integrity to Wayne's magazine. Alan said that there was a growing trend to produce specialty publications as evidenced on the number of books on packet radio, antennas, QRP, etc. He stated that these were targeted to a specialty audience - something that made them successful. The problem with including more technical articles in CQ was that they would take up room normally given to articles more suited to CQ subscribers. The loss of advertisers because of increasing numbers of "homebrew" construction projects is a moot point. Advertisers have NO worry about hams building their own gear and abandoning commercial rigs. After all, how many of us can build an equivalent to an Icom, Kenwood, or Yaesu transceiver? Or even if we could, how much would the parts cost and where would we find all the necessary test equipment? Commercial ham equipment manufacturers actually want to see experimentation. If the experimenters had not built repeaters from surplus commercial FM gear, or played with OSCAR satellites, we still might be using Gonset Goony-boxes on 2-meter AM and 432 MHz might only be used by a handful of people in VHF contests. The experimenters open up new territory for the rest of the hams; when enough people are using the new technology and there is a demand for equipment, the manufacturers are more than happy to meet that demand. Look at the number of TNC's based on the TAPR design if you want to see a modern example.

Our talking about commercial equipment brought forth some negative comments from me about the equipment reviews in CQ. Alan responded by saying that CQ is not a "Consumers Reports" magazine. He said that even though QST published measured specifications, only a very small number of hams ever understood what the numbers or the intermodulation distortion graphs meant. Alan told me that hams buy equipment based on what other hams are buying - a herd mentality. After all, the major rigs are really quite similar in technical specifications. Want the best rig? Spend the most money! {This is something I do not totally agree with although there is a lot of truth in his statements.} Of course, CQ rates rigs more on operating convenience than actual technical specs.

I pointed out the review of the AEA Iso-Loop as being representative of the type of article that turned me off completely. Alan made it clear that he understood antenna theory fairly well. He said the only reason the model that was reviewed performed so well was that it was very high-Q. Hidden away in the review is the statement that all of the metal connections in the antenna are machined and welded. If the resonant Q is high enough, a small antenna can perform surprisingly well. Of course, it is very expensive to do the machining and welding. Alan and I both wondered how long it would be before this antenna was manufactured using rivets and clamps - and ceased to perform! I told Alan that I felt this point should have been made more prominently in the article. He said if AEA changed their design to lower their manufacturing costs (and seriously degrade the antenna performance), they might consider publishing a follow-up. He also defended the antenna matching unit {?} they reviewed several years ago {Max Com, if memory serves}. This unit was basically a 50 ohm resistor across

the dipole center insulator. Paraphrasing his comments: "So what if it is very inefficient. It allows your rig to operate with low SWR on bands that you could not operate on without a tuner." Of course, the unit cost about the same as a tuner. But a tuner requires some adjustments. Me? I use a tuner to match a dipole fed with ladder line. The dummy load is used only when I don't want to radiate a signal!

I then told Alan about my earlier call to Ham Radio where they told me a number of long-time subscribers were indignant about the sale to CQ and had canceled their subscriptions. He replied that he was aware of this although he had seen very few cancellations to date. {There must be more than he cares to admit. CQ now requires you to cancel by mail, sending the subscription labels for both HR and CQ to them for processing.} Alan told me that CQ was happy to cancel anyone's subscription and refund the money for the remainder. He said he wants repeat business and a good reputation; he does not want to make enemies. He reminded me that Skip Tenny, W1NLB, had sold Ham Radio because he wanted to retire, not because the magazine was in dire straits...yet. CQ bought HR mainly for the bookstore business; the gain in subscribers had little to do with the purchase. Alan also mentioned that anyone could choose to have the remainder of their Ham Radio subscription filled by any of the other CQ publications.

Finally, Alan told me of some VERY tentative plans for the future that will definitely be of interest to the technically minded hams. He said that he was considering the publishing of a technical quarterly. This quarterly would be aimed directly at the advanced experimenter. He described it almost as a professional journal, much more refined than QEX but aimed at a similar audience. He said this quarterly would not be sold in newsstands and that he expected a total subscription list of less than ten thousand. While Alan will not say anything definite, he said to expect the first issue late next fall, perhaps in November. I wished him the best of luck with this publication.

After exchanging a few more pleasantries, I said 73 to Alan, K2EEK. He was able to answer virtually all of my questions, but I was certainly not very happy with many of his answers. CQ may add a few more simple construction projects, but will likely never publish a microwave series like Glen Elmore's. The magazine still continues to be directed to the contester and appliance operator. But I must grudgingly admit that the average ham is merely an appliance operator. CQ is a "for profit" business venture, and as such, will not risk losing business to serve the needs of a minority of readers.

So where does this leave me?

I have canceled my subscription to CQ and asked for my money back. No amount of weekend gadget projects can compensate for my complete lack of interest in DXing or contesting.

If CQ comes out with a technical quarterly, I will give it a try. If it is only moderately good, I will support it and try to make it better.

I plan to call my ARRL division director and give him HELL about League advertising that neglects to mention QEX. Your division director is usually much more responsive than League officials in Newington, CT.

I will buy more specialty publications such as the 2nd Antenna Compendium (and the Microwave Handbook if it is EVER finished). I will also buy more RSGB publications.

And finally, I will continue to support the ARRL and QST, especially when they utilize their technical articles to teach beginners. I may even try my hand at writing such an article.

Yes, but none of this has anything to do with 'homebrew repeater controllers'.

I'd like to hear more about phil's intelligent 'carrier level' sensing system which decides how strong a signal is and takes appropriate action, whether that is keying a repeater, preventing it from being keyed, or whatever have you.

Phil?

Surprisingly I have found "professional" shops tuning up front ends
and IFs by ear! But getting a sweep is not tricky. In fact most radio
service benches already have the gear sitting there.

This is what you need: A VHF/UHF signal generator with an "external
FM" input socket. An Oscilloscope with a sawtooth wave output. If the
scope does not have the sawtooth available from a socket, you can get
it out with minor surgery.

Now connect the sawtooth output to the FM input of the signal gennie.
Feed the DC from the discriminator to the vertical input of the
'scope. Tune the signal gennie to the antenna frequency and adjust
the vert horiz sweep until you get the IF waveform on the scope tube.
This works like a charm. I used this method 20 years ago, I am sure
it still works today. Coupla gotchas, the sawtooth may need
amplifying with certain gennie/scope combos. The IF disc pickoff may
need a do it yerself diode to rectify it to bung in the vert input of
the scope.

This will allow you to tune the front end and IF of a radio in
minutes. You can get very good at this and do several receivers an
hour.

Have fun.

Depends on the material between the antenna and the outside of the
house. Ferro-concrete walls and galvanised ("Hot Tin") roofs are
excellent shields. If the material is dry and RF transparent, say
polystyrene foam then it doesn't matter. If you want a general rule,
Outside is best. But if you live in Hurricane alley or you get 15 Ft
of snow every winter then inside may be better in the long run.

Could be. Move the house a few feet and watch the S meter (-:

> c) DDRR antennas are poor.
They are pretty poor. Why not put up a dipole? For indoor use you can
make one in 30 Mins with a soldering iron and staple gun.

In an hour you could make a ruggedised outdoor dipole.

Is anyone in the Waterloo/Toronto/London region interested in a Yaesu 767?
It has all three plug in modules (6m, 2m, 430-440) with about 100 hours on
the rig. Service manual and hand mike are included. aprox $3000
Eric

Assuming you don't have a tracking generator and coordinated scope, or a broadband noise generator and spectrum analyzer, you can still do a decent job of aligning a mistuned IF in the typical ham FM rig (presumably some other ham has gotten in there and tightened all the screws - IFs rarely need it otherwise!).

Make sure the local oscillators are on freq if you're injecting at the carrier freq, else inject at the IF freq. Be sure to zero the discriminator on this signal.

Peak the IF cans for maximum quieting on a weak signal. Then run a good quieting (but NOT saturated) signal into the radio from a signal generator. Apply FM deviation, and adjust the IF tuning for minimum distortion. Keep increasing the deviation and tweak for minimum crud until you've got the dev up around 30 to 50% above the rated bandwidth of the radio - i.e., 7 or 8 kHz for normal 5 kHz max gear.

You can check for distortion with a scope at the discriminator output, but your ears will probably do a better job. Trust them.

When you're all done, check to make sure that the discriminator idles very near zero on noise. If it doesn't, there's a real good chance that either you screwed up or one of the IF bandpass filters is defective.

|>
|> 3) I have a handfull of books on antennas but none discuss an antenna quite
|> like the Discone. Can someone tell me qualitatively how this antenna with
|> its double set of 8 radials "works"

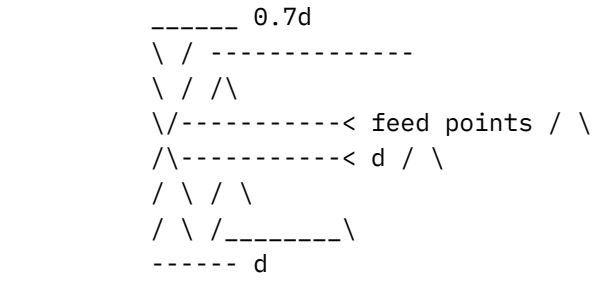
Quote from a radio handbook (not sure which one, I only have a copy of
the pages relating to discones, log-periodics and helicals to hand):

"The `discone' antenna is a vertically polarised omnidirectional
radiator which has very broad-band characteristics and permits a simple,
rugged structure. The antenna presents a substantially uniform feedpoint
impedance, suitable for direct connection of a coaxial line, over a
range of several octaves. Also, the vertical pattern is suitable for
ground-wave work over several octaves, the gain varying only slightly
over a very wide frequency range.
...

Below the frequency at which the slant height is equal to a free-space
quarter wavelength the standing-wave ratio starts to climb, and below a
frequency approximately 20 % lower than this the standing-wave ratio
climbs very rapidly. This is termed the cutoff frequency of the antenna.
By making the slant height approximately equal to a free-space quarter
wavelength at the lowest frequency employed (refers out to a diagram),
an SWR of less than 1.5 will be obtained throughout the operating range
of the antenna."

Unquote.

The essential design of the aerial (sorry, lapsing into English :-))
is, I believe, derived from the biconical, which is a more symetrical
aerial. Both are basically vertically-polarised dipoles, but with
enormous bandwidth: several octaves instead of about 10% for a standard
wire dipole.



Biconical Discone

(d=lambda/4 for lowest frequency)
Note for discone: Feedpoint is between disc and top of cone, cable and
support pole go up the cone.

In its `pure' form, the discone has a sheet disc for the top half, and a
hollow cone for the bottom half. This is obviously a substantial aerial
to build and keep aloft, so the skeletal form, using rods, is more
convenient. However, I would guess that this introduces deviant behavoir
in terms of SWR and gain.
Having said that, I am on my second discone, and I find it a really
great aerial for use with a wide-band receiver (I've not tried using it
for transmitting).

My other wideband aerial is a horizontally-polarised log-periodic array,
which is even more wierd in terms of its design, quote from the same source:

"Frequency-independant antennas, of which the `log-periodic' array is an
example, are structures that have the same performance at different
frequencies by virtue of the fact that the array is self-scaling and has
no dimensions that are frequency sensitive. A basic self-scaling
structure (refers out to a diagram of a spiral design) is described by
angles alone, with no characteristic length. Practical structures of
this type are finite in size, thus limiting the frequency-independant
behavoir."

From: guhsd000@crash.cts.com
Message-ID: <3403@crash.cts.com>
Source record: 10575

Problem: I recently got a 80 foot crank up tower for a very good price, and it's in good condition, and I don't want to get rid of it. Space is the main problem, there are not alot of areas I can put it in and guy it without using the good space we do have. What I wanted to do is stand it off the house (2 stories) and oppose the open side with 2 guy lines on the first 20 foot section.

Her Royalness didn't like the idea, and took one look at it and said put an ad in the paper. I'd hate myself later, no way in the next 20 years could I beat the price I paid.

Possible Solution: Free standing it on a 20" x 20" x 7' deep cement base, fully renforced, with the mounts welded to the re-bar frame. I figrued depth was more important than bulk, and the ARRL seemed to back this up, but the problem is there is no room for wires if I work this way. I figured that several tons of force would be needed to tear the base out of the ground, but 80 feet can pose alot of leverage. The base can handle it on the tower, and has six 1 inch mounting holes.
I was told, in it's last location, it was free standing.
My area does not get regular high winds or storms, or otherwise weather that would regularly threaten the structure.

The discone is a very broadbanded antenna. I use mine with a RS PRO-2004 scanner which has the same frequency range as that claimed for the antenna. Mine is mounted on my chimney and pulls in signals very well. Your high frequency performance is dependent on the type and length of your coax feed. RG-58 100 feet long will severely attenuate signals above VHF.
>
> 2) The claim is that it has a 1.5 SWR or better across 144,220,440 and 1296
> MHz. Anyone use the Discone for transmitting ? How well does it work ?
>
I have used to transmit on both 144 and 440 MHZ. Mounted on the chimney I have worked repeaters over 50 miles away. I get good signal reports on both bands, even when using 1.5 watts from a 440 HT. SWR on 144 MHZ was less than 1.5/1. I haven't measured it on 440.
>
> 3) I have a handfull of books on antennas but none discuss an antenna quite

> its double set of 8 radials "works"
>
The ARRL antenna book describes the discone in detail. The 8 "radials" as you call them form a disc and an inverted cone, hence the name discone. As I said above it has a low SWR across a broad range in frequencies. The trade off is an antenna with no gain. Bottom line is that I am very satisfied with my RS discone.

3975. distributing schematics

Newsgroup: rec.ham-radio
Date: 1990-07-05 00:35:16 UTC
From: kjh@pollux.usc.edu
Message-ID: <25710@usc.edu>
Source record: 10479

I don't know why I didn't think of this last week when the question was raised, but at least I thought of it now ...

Use SPICE format to distribute schematics!

Advantages:
1 It's pure ascii text, and it doesn't require a lot of bandwidth.
2 The small bandwidth is a large advantage for the packet people.
3 It fits through existing mailer programs just fine.
4 You can run it through your SPICE program, and play with it.
5 If you don't yet have SPICE for your IBM PC clone, a student version is available free of charge. Any respectable university or corporation will have SPICE running on their workstations.
6 SPICE is well known, and is _gaining_ popularity as device manufacturers are now providing SPICE parameters for their devices. In addition, other manufacturers are providing test equipment that automatically measures devices, and gives you the SPICE parameters.

Disadvantages:
1 Some people may not yet know SPICE. However, it's easy to learn.
2 Some devices used may not yet be parameterized for SPICE. Even though you can't run it through SPICE to simulate it, you can still distribute the schematic.

I think the advantages far outweigh the disadvantages. Any other comments?

Yes I regularly use a sweep generator for several areas...primarily it
is very useful when couple with the spectrum analyzer to set up cavities
for repeaters and front ends for radios. First I use the sweep generator
as a crude alinement point to get the filters shaped the way I want them,
then I use cw to check the notches and rejection at the 6 db points...
It makes setup time remarkably fast and easy. Sweepers are great for
checking out coax for flatness(as well as using a TDR)

The sweeper I currently use is a PM model 1042 5 to 500 mhz generator
delivers approximately +18 dbm across the entire spectrum, it is fairly
flat in amplitude but has a high degree of phase noise... thus I use it
with some caution when alining things. There are several nice features
on this unit such as the F1, F2 and Marker are all variable and the sweep
rate is free running, line or can be triggered. Pretty much all you need
for quick and dirty set up of if filters and the like.
As to seeing many units at hamfests I have not encountered many of them
lately nor is the use of sweep generators a dying art, they are used every
day in our company to setup they equipment we manufacture.
(Forgot to add the sweeper has a variable pad in 10 db steps)

I recently installed a TRC-430 Realistic (radio shack) CB in my pickup.
I had real bad problems with receiving and sending... forget it!
I just got the SWR meter and after spending an hour fooling around trying
to figure out whats right and whats not heres what i got...
the field strength from about 2 1/2 feet away (with the CAL in the middle..
whats a good setting to put CAL on for field strength anyways??) but i dont
know if thats up to par with what i should have.. or is it?
with the regular SWR testing i was able to get channel 19 to just about 1 and
channels 1 and 40 were at about 2.. i think thats how its supposed to be
if you just want the bands be to "even".
But when you transmit, i was used to the regular setting of all 3 green bars
and the red (4th bar) lighting up. now only 2 bars light up. whats the deal?
I am able to get all 4 bars to light up IF my field strength is 0 (again with
CAL in the middle) and the regular SWR testing showed a 3-4 on all channels..
Shouldn't all 4 bars light up when transmitting?
Maybe one of you experienced CB'ers can help me out with this, I'd really
appreciate it...
Thanks...

I just stick the spare batteries in individual zip-lock plastic bags in my aluminum suitcase. 100,000+ air miles and never a problem.

I have carried 35mm still cameras, film, walkies, walkmen, motion picture and video equipment, oscilloscopes, toolkits, and demo equipment onto I don't know how many planes over the last 15 years, and all they want to look at is my umbrella. Every time; never fails - so I stick the umbrella in my jacket pocket and throw the whole thing into the xray.

Not ONCE have the wanted to look at my battery stuff, and with the plastic bag trick, I've never had a short or a leak.

I can tell you a story about getting an interesting burn mark when the battery contacts on the bottom of a walkie shorted on a jewelry chain I was wearing, but I suspect there's few of you I know well enough to show you the scar....

The last airplane flight I went on I took 4 BP-8S packs with me. These are the 1200mah biggies. I packed them in the suitcase as usual. When it went through the X-ray machine, the attendant called the other one over. I heard one say to the other "they look like ball bearings to me". They asked me what "all those round things" were. I said I had several radio battery packs inside. They said "ok" and let me pass. Inside the secure area I opened up the suitcase and found that based on the orientation of the 4 BP-8S's AND the 2 BP-70's, they would be been X-raying down the axis of the cells of every pack. I have opened them and know the cell configurations.

BTW, Brian's idea of putting a battery pack in a zip-top bag is a good idea. I don't know why I didn't think of that; I use those bags for just about everything else.

I'm looking for information on the FCC General Radiotelephone Operator License. Specifically, I would like to know the difference between the Class A, B and C licences - what they're required for, what is covered on the exams, etc.

I'm an EE student with an interest in RF engineering and I have a Restricted Radiotelephone license, but that simply requires that one is able to fill out the requisite form. Are there any jobs where one is still required to have a Class A [or Class B or C] license? Any information would be appreciated. Unless you think your response is of general interest, please send e-mail. TNX.

3985. Kerchunking (was Re: Homebrew repeater controllers)

Newsgroup: rec.ham-radio
Date: 1990-07-05 06:24:56 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <26712@netnews.upenn.edu>
Source record: 10485

The best way to prevent kerchunking and still maintain a courtesy beep and/or a transmit carrier hang time is to have the repeater only key up when a carrier breaks squelch, PL is heard (if applicable) AND audio is present. This forces the would-be kerchunker to say something, hopefully his call sign. At least one repeater I know of here uses this technique, quite successfully. The reason it works is that nobody wants to key down and say "Hello" or "Testing", without IDing for fear that his voice would be recognized.

After the repeater is first brought up, the audio-presence test should probably be ignored, as there is a good chance that the first few ms of a transmission may get cut off before the controller realizes that audio is present, but the delay would probably be insignificant if done properly.

The only problem with this system is that unfamiliar users would probably assume that the repeater was down. But hey, if everybody did it this way, kerchunkers would soon become extinct. Yeah, right :-)

>Which do YOU think is the most achievable?

D, obviously. Repeaters and user radios may not break, but they will NEVER make the repeater 100% of the time. The problem with D is that the users go away, too, since the repeater is unusable.

>(Recall that if you have a real radio, IT won't make any noise when the
>signal comes and goes either, so if the repeater also lacks pinball machine
>noises, it could be kerchunked all day long and nobody'd care.)

Obviously, your definition of "real radio" only includes anything with a MICOR squelch circuit. By that definition, only Motorola makes "real radios", and not all of them; my IC32AT definitely doesn't qualify, but my custom-built Flitefone III full-duplex mobile does, since I built a MICOR squelch for it. Of course, it's easy to tell with a full-duplex radio whether or not you're making the repeater, but the only in-band full-duplex portable radio I've seen is the (surprise!) Motorola APCOR cardiac telemetry radio - at well over $1K on the used market, and it's a luggable.

Coincidentally I just took out of our library the 1946 (!) volume of the
Proceedings of the Institute of Radio Engineers. The February issue has
an article entitled "Three New Antenna Types and Their Applications" by
Armig G. Kandoian (pp. 70W - 75W). One of these antennas is the
Discone.

Bring on the technical articles. I would much rather read about technical topics than sea lawyers arguing about the legality of phonepatches, autopatches other fine points of interpreting part 95. I would really be pleased if we could get the technical community to post their articles and projects here. I am sure that there would be some difficulties with formats for different computers, but it could be worked out. If the authors are willing, I'd be happy to have it! 73

This sort of stuff is really neat. Here in Rochester we have a repeater
that uses (I believe) a General Electric voting selector. The unit uses
an internal noise source to compute the signal-to-noise ratio of the in-
coming signal, and takes that one. This signal may not necessarily be
the one with the highest S-reading (or so I am told). The selector also
employs circuitry to provide a switchover "threshhold", i.e. receiver 1
will stay in effect until receiver 2 is markedly improved, so that if you
are smack in the middle of the two it won't clack back-and-forth.

The part that amazes me is that it is a completely analog device. (Yes,
I am stuck in the digital world, and I would have guessed DSP only).

Does anybody have any (technical) insight on how these things work?

Most of the postings in this group seem to come from the technically inclined- I don't recognize many DXers or contest callsigns- so I want to point out something which may be of interest to you.
I, too, lament the loss of Ham Radio as do many other Dxers and contesters I know. Since CQ is sponsor of the greatest DX Contest on earth, it has become the focal point of Contest scores and news. So all the contesters feel required to subscribe for the contest news and scores.

But you would be surpised at the number of contesters I know, (even members of the CQ contest committee) who consider the magazine completely worthless, outside of contest results. (Of course, if you have no interest in contests, then it IS completely worthless!) I think that many contesters and DXers would welcome a more technical editorial policy.

Market research is part of K2EEKs job, and I don't want to second guess him on this point. But perhaps he is underestimating his readership? After all, the contest community is one of the first to embrace new technology if it leads to higher scores. Witness, for example, the enthusiasm with which contesters adopted computer technology to radio(K1EA, K8CC, etc.).

On the other hand, I am reminded of the quotation:
"No one ever lost money underestimating the intelligence of the American Public." Could this also be true for the Amateur Radio public at large and CQ's readership?

>
>Use SPICE format to distribute schematics!

>I think the advantages far outweigh the disadvantages. Any other
>comments?

The disadvantage is that it is just a netlist. A well drawn schematic gives you a lot of semantic clues about how a circuit works that just aren't there in a netlist (though you can put comments in).

If this subject has been hashed through before, someone must have brought up EDIF (Electronic Design Interchange Format). It allows you to include graphic schematic information, netlist, physical layout, behaviour, etc. If someone has already designed a board for a circuit, you can include that as well as the netlist.

Disadvantages to EDIF: Reading it directly is probably about as intuitive as reading postscript. There isn't a whole lot (any?) public domain software out there to translate EDIF into more useful forms, but we could change that if we wanted to use it.

I need some help finding a modification for the Kenwood TW4100A. A friend had modified his for out of band RX by means of some keystroke commands. Unfortunately, he reset his CPU & does not remember the sequence. We are not interested in the hardware mod that extends the TX, we do not want to extend the Tx range on the radio, only the Rx.

If anyone knows the modification, please e-mail.

Message-ID: <9007051610.AA00490@ti.com>
Source record: 10497

Hollywood and our friend Bruce Willis have managed to get the Kenwood name up on the Big Screen again. (really, the producers and studio, I doubt if Mr. Willis knows or cares about the significance... they're just "movie props!")

The HT's were TH45's and you could read "440 MHz" just as plain. I dunno, I should have asked the guy sitting in the row in front of me if he noticed. I sure did, but I would tend to, the average moviegoer probably won't.

They supposedly had "scramblers" and since our hero didn't have the code to key in, he couldn't use the radios like he did in the first film.

They also showed a larger Kenwood rig. Sorry, I couldn't see the model and don't know the product line well enough to sasy what it was; it was on screen a few times, but for seconds at a time. They even had a scope sitting on top displaying a nice sine wave...

I wonder what agreement Kenwood has with 20th Century Fox??

Cross-posted to: rec.ham-radio,rec.radio.shortwave

TO ALL INTERESTED PARTIES:

The Launch of the balloon CARRYING LIVE ATV has been re-scheduled
to SUNDAY JULY 15 at 9:00 AM. The Net will start at around 8:00 AM
on 7155 KHz. The launch of the "micro-balloon" with the cw telemetry
is still scheduled for this saturday (July 7) at 9:00 am.

Coverage of both the micro balloon and the live ATV balloon should
be in excess of a 400 miles radius centered around Peteborough N.H.
This should provide coverage south past Washington D.C., west past
Rochester N.Y., and north into the Montreal area. ATV beacon (2M)
will be 144.34. Video 439.25 (Cable Ch 60). Micro balloon frequency
will be different. Details to follow.

Howdy:

I finally got together enough modified loader code so that we can bypass this problem with the DOVE S band modulator. Hugh Pett, VE3FLL, original author of the BOOTLOADER running on all four microsats, and I worked together for several days getting together a subset of the loader on board, and a modified version of the ground station bootloader exerciser.

The problem with DOVE has been caused by a failure (we believe of a silver mica cap) in the modulator for the S band transmitter. This failure caused the data modulation index to be VERY small. The total phase shift was much less than 180 degrees for a data 1. It was so small that no existing standard PSK modem (TAPR, PACCOMM, or G3RUH) could demodulate it. I wrote a DSP based demodulator that worked fine by moving around the place where the data was sliced. The problem with this approach is that I have a pretty good S band receive setup but not a great one. I couldn't give up the DSP modem as I was doing code development on it for AEA. I finally decided that the one and only weekend I could work on this was this coming weekend and I prepared to go to Boulder to the home of K0RZ. Bill has an outstanding S band setup and is a satellite afficionado. This put me so far into the doghouse at home that I became frightened into the solution that I should have come up with three months ago.

If we could just get a few hundred bytes into the spacecraft by ASSUMING when we heard any response it was an ack, then we could put in a loader that didn't have the faults of the one we flew. I made a mentat computation (in other words I hoped ;-) that if I heard a response from the spacecraft when I sent these ten packets the probability that the response was a NAK instead of an ACK would be low. Furthermore, since this code did NOTHING to the modules in the spacecraft around the transmitter, then the likelihood of doing something dumb if one of the packets was a NAK would be low. The watchdog would just not be banged and it would reset back to the ROM or I would have to resend the reset signal. The only thing that could really go wrong is by some freak accident the 2 meter transmitter got turned on. I really did view this probability to be exceedingly small. So I risked sending code in the blind. The loader came up and from all indications functioned perfectly from the first try. Last evening, K0RZ hooked up a phone patch to his rig and I transmitted load commands to DOVE on two meters. I could easily hear the ACK (remember NAKS are no longer transmitted) and hit the `continue on with the next packet' key now built into the ground station loader code. I finished the operating system (kernel) in one half of a pass. This morning, I found the main problem with the S band system at my house (a lousy job on an N connector in the line between the S band antenna and the S band preamp). After I fixed that up, I was able to load half of the remaining code in two passes. Unless something is really wrong,

I will be turning DOVE's 2 meter transmitter (145.825) on by this weekend. All appears to proceed normally.

3998. The World's Largest QSL Collection?

Newsgroup: rec.ham-radio
Date: 1990-07-05 17:32:48 UTC
From: sawyer@twg.com
Message-ID: <7488@gollum.twg.com>
Source record: 10508

Yesterday (July 4) I had the privilege of seeing what is reputed to be the world's largest QSL card collection, and this was so astounding it just begs to be passed along. For those who are "too busy" to QSL or who think that replies via the buro are beneath them (Jim, are you listening?), this collection should be cause for pause.

Lloyd and Iris Colvin held a July 4 picnic for the Northern California DX Club and threw their card collection open to the guests. Let me try to describe. There are two rooms used to house the collection, and the floor has had to be reinforced from below to hold it. In these two rooms, there are a total of 24 filing cabinets stuffed full of QSL cards. Each cabinet has 12 rows of drawers with 2 side-by-side columns of cards each. The stacks were an average of about 2 feet deep. My estimation is thus 24 x 12 x 2 x 2 = 1152 feet of QSL cards. I believe that's a little more than the height of the Empire State Building! The sheer volume wouldn't be so much, but the organization of these is what is incredible. They are sorted alphabetically and meticulously arranged by call sign. And it is not only the amateur QSL's so arranged--every SWL card they have ever received is also filed away in order. Naturally, I went to see if they had all of mine from their recent Niger-Burkina Faso-Bahrain-Algeria-Australia-New Zealand-French Polynesia expedition. Every one of them was in there, filed in precise sequence by date of contact. While we were going through this stack, one fellow came upon a card his GRANDFATHER had sent the Colvins! Still looking for an A6 card? Lloyd and Iris have a 4" stack of them. And on and on it goes.

If you've ever read the front of one of their YASME cards, let me vouch for the authenticity of what is claimed on them. They have operated from 140 different countries, and have now qualified for DXCC from over 100 of them. Lloyd got his ticket back when he was 12, and he's been hard at it ever since. He's now 75. Iris didn't get her license 'till 1945, though. Every award you ever heard of is hanging on the wall--including at least a dozen top score trophies from CQWW and the ARRL DX contest. They only admit to "about" 600,000 cards, but I can't help but believe 1152 feet of QSL cards is more than 600 K. Every one of them, of course, has been answered. Promptly. One person--W6NLG--even told me Lloyd had once bugged him for a card for a contact when he hadn't sent one in! Seeing all of this, I suspect I'll think twice before grumbling about the next stack of SWL cards that comes in with my next buro batch.

3999. kenwood 440 mic shock

Newsgroup: rec.ham-radio
Date: 1990-07-05 17:40:29 UTC
From: washer@unisoft.UUCP
Message-ID: <3062@unisoft.UUCP>
Source record: 10504

Recently, while operating my kenwood ts440s mobile, I received
an electrical shock from the metal plate on the back of the stock
microphone.
I was opertating 10meter side band. I had been doing so for some
time with no problem, however when I pulled into my driveway (up
close to the house which may have effected the SWR) I began
to 'feel' a burning sensation on my hand. This occurred only
while transmiting.

Opening up the mike reveals that the metal plate is connect to
one of the mic cable pins. see diagram

Looking at the microphone cable (not the radio jack)
v
o o
this pin--> o 0 o
o o
o

Now, depending on how you interpret the drawing in the 440 manual,
this is either STBY(pin 2) or NC(pin 6).

Now the questions.
a) was this 12v dc coming thru the mic wires?
b) was this rf energy ?
c) what was this?
d) WHY IS THIS PLATE CONNECTED TO ANYTHING TO BEGINE WITH.

Well, Any comments or answers would be appreciated.

Tnx

> with the local PD on things like "Halloween Watch Patrols" according to the
> FCC because it's contributing to the "routine business" of the Police Dept.

Let's take a "sideways" look at that, Skip.

I am sort of get the impression that ANY amateur activity involving some public function, walkathons, whatever, COULD BE interpreted in some way by SOMEONE as contributing to the "routine business" of SOME party of agency, unless an actual emergency precluding "normal" communications occurs. Especially with cellular phones being more and more common, that narrows it down even more.

I've read through Part 97, plus the ARRL comments in the "FCC Rule Book," and I sort of understand the logic (?) behind the "routine business" argument, but have you heard of a CASE OF SPECIFIC PROHIBITION in this type of activity?

I'd think that if it were planned just right, we could come up with a ham activity for almost any occasion. One that did not interfere with, and could, in fact, aid the public interest... (call it a training/preparedness drill!) ...no matter what the public activity is!

It would, of course, be to our (hams') best interest to widely publicize such a training exercise in the community (good public relations, don'tcha know!) and to keep the local authorities advised of the activity... and if the hams happened across a lost kid during their Halloween Nite Transmitter Hunt, well, it'd only be public spirited citizenship to communicate that to the police...

Creativity, gang. Non-linear thinking, sometimes...

What say?

CC:
Subj: Re: Carrying NiCd packs on airplanes

The last airplane flight I went on I took 4 BP-8S packs with me. These are the 1200mah biggies. I packed them in the suitcase as usual. When it went through the X-ray machine, the attendant called the other one over. I heard one say to the other "they look like ball bearings to me". They asked me what "all those round things" were. I said I had several radio battery packs inside. They said "ok" and let me pass. Inside the secure area I opened up the suitcase and found that based on the orientation of the 4 BP-8S's AND the 2 BP-70's, they would be been X-raying down the axis of the cells of every pack. I have opened them and know the cell configurations.

BTW, Brian's idea of putting a battery pack in a zip-top bag is a good idea. I don't know why I didn't think of that; I use those bags for just about everything else.

4003. Icom IC-2SAT enhancements, part 2

Newsgroup: rec.ham-radio
Date: 1990-07-05 18:46:11 UTC
From: cromwell@rvl4.ecn.purdue.edu
Message-ID: <1990Jul5.184611.20707@ecn.purdue.edu>
Source record: 10506

A friend of mine in Germany mailed me a *very* intriguing photocopy of a letter he received from someone who works for Icom-Europe. It's an internal ICOM memo with details on how to do all sorts of nifty tricks with the IC-2SE (which may nicely translate to IC-2SAT tricks).

I have attempted to exactly duplicate the memo below, mangled spelling, unclear passages, and all. I don't have an IC-2SAT service manual yet, and so I'm not qualified to say if this is all really applicable or not. And, the German at the closing is a mystery. I typed "fu:r" to indicate "f<u-with-umlaut>r". Anyone with more details, please let us know!

Bob Cromwell KC9RG
cromwell@ecn.purdue.edu

ps: For the people asking "what was your original diode matrix, that appears at the end. There was some thought that the matrix programming changed after the first few (hundred? thousand?) models. This is from the schematic that came with mine, with serial number in the 9500's.
pps: Before you ask "where's part 1", that was the article titled "Icom IC-2SAT", where I gave results of signal generator testing....

heachtet werden.

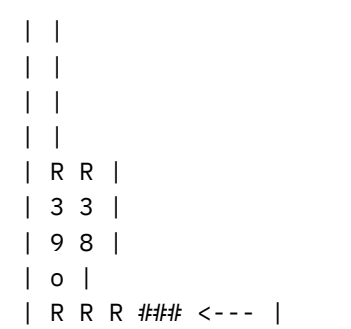
>>
[page 2]

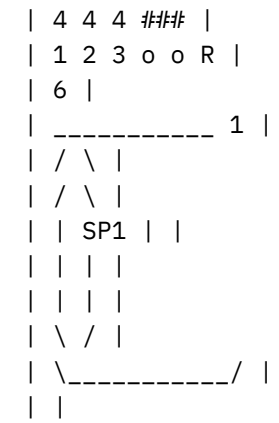
IC-2SA/E Frequency range expantion

* Remove any diode position on D6
* Install diode DA (code No. 1750000160) position D6

After this modification frequency lock range will be expand typicaly :

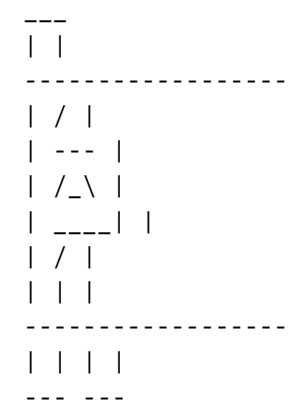
RX (MHz) : 108 - 140 (AM) , 138-169 (FM) , 310-370 (FM) ,
TX (MHz) : 139 - 163 (FM) ,





>>>
[explanation of page 2]

Yeah, the above is crude, just meant to give the relative locations of the
mysterious diode, SP1, R38, R39, R41, R42, R43, and R61. The 3-terminal
box with an arrow drawn to it (the arrow is in the original image) looks
like the below. A diode is connected from the lower left tab to the upper tab.



>>>
[diode matrix programming]

To simplify/fool-proof this, if the schematic has:

(X) --->|--- (Y)

I'll say "from X to Y". From the "IC-2SAT IC-2SET SCHEMATIC DIAGRAM":

Japan Version D6: DA115 from KEYI2 to KEYS2
Europe Version D5: DA115 from KEYI0 to KEYS3
D6: DA115 from KEYI2 to KEYS2
Italy Version D5: DAN202U from KEYI1 to KEYS3 and
from KEYI0 to KEYS3
D6: DA114 from KEYI0 to KEYS2
U.S.A. Version D4: DA115 from KEYI2 to KEYS3
D9: ISS254 from KEYI1 to KEYS2
Australia Version D5: DA114 from KEYI1 to KEYS3
D6: DA115 from KEYI2 to KEYS2

Asia Version D4: DA115 from KEYI2 to KEYS3

Now, can anyone use this to figure out the Icom-Europe memo???

Since I've been out of broadcasting for some time perhaps someone can be of help. My general radiotelephone license is in need of renewing. What are the current procedures for doing this. Since I once held a First Phone do I have to do anything to keep my transmitter prividges?

Your help is appreciated.

Well, I've been off the air for a while, but at least when I was on the
air...

> - BT vs. periods for punctuation,

BT isn't so much punctuation as it is the CW equivalent of "uhhhh..."
At least when I used it, it was more like an ellipsis (...) to indicate the
end of an incomplete thought, or sometimes as a paragraph marker.

> - one or two BT's at a time,

"uhh..." versus "uuhhhhhhhhh..." :-)

> - R R R vs. FB,

I've never considered them interchangable, but...

> - R R R before or after the callsigns,

Generally it is an emphatic "Roger, yup, copied that, yup, yup, yup",
which sounds silly but quickly becomes habit. (:-) When FB is used as filler
it might occupy the same location (start of a reply, after the IDs).
I generally used FB only when I wanted to specifically indicate approval or
interest in something particular.

> - 559 vs 55N for the 2nd RST report,

That's someone being honest, saying solid copy (5xx), quality signal (xx9),
middling signal strength (x5x). If by "2nd RST report" you mean after hearing
the first person say 599 or 5NN*, then the first person either had a really
hot receiver or was the kind of person who might say "YR SIGS 5NN PSE RPT ALL
AFTER CALLSIGN QSB K"... (Hmm... is QSB fading? I don't have a
reference handy, and it HAS been quite a while)

* Bonus answer without a question: "cut numbers", exemplified by 5NN,
actually are an honored tradition, whose roots are obscured by the fact that
you usually hear them in the ham bands only for "5NN" signal reports. When
the question of "number or letter" is unambiguous, it is semi-traditional to
replace the dashes in a number with one dash, resulting in "AUV456BDNT" for
1..0.

> - differing amounts of abbreviations,

Personal style (and instantaneous level of fist exhaustion :-).

> - BK vs. BK TU vs. callsigns DE callsign KN,

--
You need only ID every 10 minutes; BK (sometimes B...K, sometimes BK) is to hand it over without IDing. KN used to be used to emphasize that you want *only* the addressed station to reply, with K meaning breakers will at least be considered; I understand that KN has become nearly universal and has lost the distinction.

> - when to use AR (I've only heard it used twice),

Oh dear. Great shame. I knew what this meant, it was important, and it has completely slipped my mind. I think it means "end of contact, but I'm just sitting next to the rig with nothing better to do, so someone else can call me if they wish".

> - leaving out one callsign and just send DE callsign,

OF syndrome strikes again; I think you need not identify both stations any more, just yourself (except at the beginning and end), but I'm not sure, since that would be a change from when I was active.

> - SK before or after the closing callsign,

"Pulling switches, don't bother calling me even if you ARE the last DX contact I need for DXCC, because I am going off for dinner just as soon as we finish five minutes worth of the dit-dididit-dit / dit-dit ritual."

> - the dit dit at the end of contacts.

an amusing closing ritual, the full version of which is
WA0AAA WZ9ZZZ
dit-dididit-dit
dit-dit
dit-dididit-dit
dit-dit
To the rhythm of "Shave and a haircut...two bits". Once, someone and I dragged this protocol out for about 20 cycles or so, until I ID'ed again with a very emphatic "dididididahdidaaaaaaaaaaaaaaaaah" at the end :-).

> Also, could someone post or email me some transcripts of some basic CW
> QSO's, including things like a contest contact, a short DX QSO and a
> typical novice interchange (name is, rig is, ...).

Let's see... I *think* the "ARRL Operating Manual" actually has a few of these in it (and is probably worth having even if not).

>mode of operation. As a club they have provide incentive for
>contacts by providing competion between groups and individuals
>for FM only competition.

My VHF contest experience has been in four geographic areas:

- Philadelphia/southern NJ
- Pocono mountain region of Pennsylvania
- Maryland/DC
- Boston/Worcester MA.

Virtually all of my operating has been with medium to large multioperator groups. FM, while not the predominant mode used to make contacts, still produces quite a number of contacts, especially on 144 and 220 MHz. I have found that the closer you are to a metropolitan area the more success you will have. This makes sense, of course. The more people there are close to you, the higher your probability of getting *someone's* attention on one of the simplex channels.

Some of the highest 2m FM totals I have seen have been from operations near Boston (Mt. Wachusett, with the K1TR group) and one between Philadelphia and New York (Camelback Mt. in the Pocono region, with the K3MTK group). The location near Boston is on a mountain (approx. 2200' AMSL) with a clear shot into Boston and in most other directions except west. The Camelback Mt. location has an excellent shot towards Philadelphia AND New York, and for that reason is ideally suited to produce a large number of FM contacts.

The best strategy for getting FM contacts seems to be hitting the main simplex channels every fifteen minutes or so for just a few minutes, then going back to SSB/CW.

>Anyway to make a long story short, those fm contacts do help the club,
>at least from looking at the January results.

FM contacts help all entrants' scores, regardless of where they are located. This is true in all VHF contests, but I have to agree that it is most lucrative in the January event. Just check out all those FM only scores in the Western NY Section! Amazing!

4010. Re. VOA Feeder on 20125 kHz USB

Newsgroup: rec.ham-radio
Date: 1990-07-05 22:28:22 UTC
From: ckp@cup.portal.com
Message-ID: <31451@cup.portal.com>
Source record: 10511
Cross-posted to: rec.ham-radio,rec.radio.shortwave

To add to the discussion about the VOA Feeder on 20125 kHz, the following appears in the July, 1990 edition of The Umbra et Lux Newsletter, published by DX/SWL Press. It is reprinted here with the permission of the publisher, Harry L. Helms:

"The June, 1990 issue of Clandestine Calling published by Harald Kuhl contains news of an unusual signal on 20125 kHz USB being heard in Europe. This station seems to be operating on a more or less continuous basis with

music and scrambled voice traffic. It appears that the purpose of the music is to hold the channel for the scrambled voice transmissions.

"A breakthrough in identifying this station took place on May 24 at 1505, when Sweden's Claes Olsson reported hearing the music stop and the following voice traffic in the clear:

"Greenville calling. Greenville calling Liberia. Do you
copy us? (Pause) Gary, Gary Wise. Hello. Hello. Gary
Wise. Libera. Liberia. Greenville calling. Over.
(Pause, with people heard speaking in the background).
Hello Liberia. Liberia, this is Greenville calling, this
is Greenville calling. Do you read us? Over. (Pause)
Hello Liberia, hello Liberia, this is Greenville calling.
Do you read us? Over."

"After this the music started again.

"It so happens that 20125 kHz is listed as a VOA feeder station at Greenville, NC. But what's with the scrambled voice traffic? And is it just a coincidence that the VOA Greenville feeder on 7651 nicely coincides with KKN44 on 7652 kHz? "

The Umbra et Lux Newsletter is available from DX/SWL Press, 10606-8 Camino Ruiz, #174, San Diego, CA 92126. Published monthly $18/yr, $2.00/sample.

[stuff deleted]
>radios", and not all of them; my IC32AT definitely doesn't qualify, but

Now we get down to it. The users that go away are the ones with handie-scratchies trying to use them from marginal locations on the fringes of the repeater's coverage. In my opinion, if you are not equipped to put a full quieting signal into the repeater you shouldn't be attempting to use the repeater except in that mythical life or death situation where no other means of communications are available. And even in that situation, if someone is not there to hear your distress call, all the little beeps in the world won't help you. The only thing worse than listening to endless beeps and boops is listening to someone sitting in his easy chair fading in and out of the repeater with each breath because he is to lazy to walk over to his base station and put a solid signal into the machine.

I was stopped by an attendant while leaving Gatwick Airport in London. She
thought the battery pack looked like explosives! They wanted me to open the
sealed pack, and after much conversation finally agreed to let me pass. They
can cause problems.

P.S. The battery pack was attached to an HT in my carry-on bag.

I have a number of ideas, none of which I have ever experimented with yet. I really would have to get into the experimenting to really come up with anything useful (or determine if I am off base). But until I can experiment in software without having to build my own hardware (since I don't want to experiment with that right now) the ideas will just have to sit in limbo. We'll see what can be done with the Kantronics DataEngine once they get their promised developer's technical reference manual out. I just hope they have not hired one of George "read my lips; no new taxes" Bush's relatives to publish it.

A voting system would basically be relatively simple to do. Sure you could do it in software, and I personally would rather do so since my software writing experience is a few orders of magnitude greater than my hardware building experience. But a hardware based one would not be that hard to do either. You could do it by having a binary tree where the leaves are hardware representing the input signals. Each node selects the quieter of the two signals and at the end pops out the quietest signal. Rather than have a noise filter and detector pair at each node, only one per input is really needed, and its output, a constant DC level, would be passed on from node to node.

Required characters are A-Z, 0-9, PERIOD, COMMA, QUESTION MARK, SLANT BAR,
<BT>, <AR> and <SK>.

Note that in counting characters for "one-minute solid copy" that letters
A-Z count 1 character each, and everything else, numbers, punctuation, and
prosigns, all count 2 each.

> ... Is this listed in the ARRL study guides? (along
> with required punctuation?)

Yes it is pretty much listed in any good code study guide, ARRL and otherwise.

It is in PART 97 which is included in the ARRL's "FCC Rule Book" and in the
"Tune in the World" and other code practice stuff. (Gordon West (no relation!
:-) , AMECO, Radio Shack, etc.)

4017. Better muffler for a generator

Newsgroup: rec.ham-radio
Date: 1990-07-06 02:33:57 UTC
From: larry@tapa.uucp
Message-ID: <1990Jul6.023357.812@tapa.uucp>
Source record: 10514

I purchased a couple of years ago from K-Mart one of the Coleman 4kw generators which comes complete with a "Low Tone" muffler. Well to my way of thinking it isn't very "Low Tone" at all. It's noisey enough to require ear protection when in a garrage with it running.

Since it has an 8hp. Briggs & Stratton engine I checked with my local repair shop and found out that I could buy for about $30 a "Super Low Tone" muffler kit. The kit includes all the bolts and gaskets neede for the new larger muffler. The only addtional item I needed was some anti-sieze which I got from the local auto parts store. I installed the new muffler in less than 5 minutes and what a difference it makes. I can actually hear the acoustic noise from the generator itself (sort of like a quiet siren) and can be in the garrage the without hearing protectors. Highly recommended mod.

The repair shop had a catalog with "Super Low Tone" mufflers for most all of the Briggs engines. For my 8hp. engine the Briggs part number is 398200.

>I sit back and smile a smile full of vindication now when
>I hear someone praise the simple operation of our repeater
>while using the cross-band feature of his radio.

>It really is more fun to be a smart ham than a flashy ham.

Well John, you can be smart and flashy too! Put a subaudible
tone on the repeater transmitter, HOWEVER rig it a little differently
than usual. Instead of having the subaudible come on constantly
with the transmitter, you have it triggered by COS (carrier operated
squelch) only. I.E. The subaudible is on ONLY when someone is trans-
mitting INTO the repeater.

You then take your nifty-neato cross band repeat rigs and equip them
with subaudible decoders. Now everything works perfectly no matter
how long the repeater's squelch tail is, and ... if you have TWO
repeaters that do this... guess what the cross band repeat rig can
then do? Should be obvious! This can also be connected (as we did)
into a user controlled command so it can be turned on and off. It is
cheap and easy and solves the cross band repeat guys problem and also
allows a longer squelch tail for those that like it (as I do).

Short or nonexistent squelch tail repeaters have their proponents, but
with the band openings around here I get tired of hearing the machine
bang up and down constantly. YES, I am aware of hysteresis squelch
circuits and there is one in our repeater... yet when the band gets
weird, they are not fool proof. Getting into the theory of it all,
which is more stressful on the darn thing; A repeater coming up and
staying up for 10 minutes, or a repeater keying up and down 50 times
in the same period?

Bottom line? It's all just a matter of taste, and there is plenty of room for either method.

In article <1250184@hpnmdla.HP.COM> donm@hpnmdla.HP.COM (Don Montgomery) writes:
>Then there's the conversation overheard on 11 meters:

Ghad, another one who missed the point entirely.

Explanation: hams are supposed to be technical. They had to pass an exam that purported to show that they were technical.

CB'ers aren't supposed to be technical. Therefore, their ignorance of technical matters is not remarkable. They got their radios to chat with one another, not to be technical. The pseudo-technical discussions of CB operators are just like the chat you have with the gas station attendant about your work - he's just making conversation while you fill up with guzzoline - or the chat you have with your bartender whilst he mixes your favourite popskull. Think of CBers as being the radio equivalent of shade-tree car mechanics.

No, what is remarkable about voodoo radio is that these are people who passed an exam and still couldn't grab their ass with both hands, radio-wise, without an illustrated manual.

As with driving skills, I think periodic mandatory retesting on radio knowledge would be a wonderful idea. After all, how are supposed to advance the state of the art when we don't even insist that people keep current in it?

This posting is for a friend, whose news feed has dried up for a while. Please reply to him directly as per his signature, please don't hit the "r" key !

Message from friend follows:

Hi,
I've just become the owner of an "Eldorado Model 992 Microwave Universal Counter", but I didn't get the manual :-(. I was told it covered up to about 500MHz directly, and would cover up to 18GHz with a prescaler. I do not have a prescaler, and would very much like one if anyone has one to spare. I am also looking for manual(s) or any information about this item.

The unit seems to have been manufactured by "E+H Research Lab's Inc" of Oakland, CA; 555-1212 has no current listing for them so either they've closed or moved.

Any information/manuals/prescalers would be gratefully received.

Thanks in advance,

There is a company here in the UK that sell a device called a 'Powerbank'
which is a hand-held unit containing (i believe) a set of high current 12volt
Nicads and a recharger. The thing is lunchbox-sized, and claims to be able
to jumpstart automobiles. It is sold as being ideal for campers/yachtsmen etc.
for a portable power supply. It would also make a fine power supply for
portable radios. Cost here in the UK is something around one hundred pounds
sterling (make that about 180 US dollars).

While I might quibble over the details of which freqencies are allocated to broadcasting and which are allocated to hams, on the whole, I've got to say that I think that this is a great proposal, and I sure do hope that it is put forward and adopted at WARC-92.

The situation in the 41-meter band has basically been unaccepable for as long as *I* can remember (~20 years): neither broadcasters/listeners nor hams have been very happy about it, and it has been the source of needless friction - and occasional outright hostility - between SWLs and hams.

Adoption of the proposal described in the base note (or some similar scheme) will make *everybody* happier. Broadcasters and listeners will get a much- needed chunk of the lower end of the HF spectrum. This will help relieve congestion in the 49- and 31-meter bands, which is guaranteed to get even worse as the solar cycle starts to decline. Hams in North and South America will retain a 300 kiloHertz wide slice of spectrum around 7 MHz; much (most?) existing ham gear won't require extensive modification to work in the newly allocated band, as things have only been "shifted down" by 50 kiloHertz. Its probably true that most 40-meter ham dipoles won't even need to be recut to work pretty well. Hams elsewhere in the world will have a red-letter day, finding a 300 kiloHertz wide band available to them where before only 100 kiloHertz was allocated.

If this proposal is adopted, maybe its only a matter of time before the similar problem in the 75-meter broadcast-band/80-meter ham-band is cleaned up as well.

Hat's off to a great proposal!

4030. Book Review: Exploring Antennas and Transmission Lines....

Newsgroup: rec.ham-radio
Date: 1990-07-06 13:34:11 UTC
From: harrism@aquila.rtp.dg.com
Message-ID: <1990Jul6.133411.8767@dg-rtp.dg.com>
Source record: 10336

"Exploring Antennas and Transmission Lines by Personal Computer".

Author: John A. Kuecken; Publisher: Van Nostrand Reinhold.

I've only had this book about a week, but I really like it. It's approach is a bit more engineering oriented than theoretical. I don't have the Jassick classic so I can't compare them. The program sources in the book are mostly in APPLESOFT BASIC although porting them hasn't been a problem. In addition to the technical content, I really appreciate the book for showing how to put the abstract equations into practice on the pc and *see* the results.

About $45 from your local technical bookstore (I had to order it).

If you want to preview it, you should be able to find it at any University library. I found this copy at North Carolina State while researching Smith Charts.

Some tidbits from the cover and TOC:

"Rely on this step-by-step guide to turn your personal computer into a teaching tool for antenna arts."

"John A. Kuecken thoroughly explores antenna, transmission line, and propogation topics. He shows you how to use your computer as an instructional tool while giving you practical design programs. You will be able to use your computer to illustrate concepts that are usually difficult to visualize sucy as contra-rotating vectors in transmission line problems and circular polarizations."

"Exploring Antennas and Transmission Lines by Personal Computer privides detailed coverage of antenna couplers and land mobile antennas, an area not usually examined in most antenna reference books. I enables you to experiment with the Fast Fourier Transform to develop the phase and amplitude distributions required to form arbitrary shaped beams such as the cosecant-squared shape used for search RADAR."

"Antenn Basics are clearly explained including:

x. action of arrays of sources and unfilled arrays.
x. effects of aperture distributions
x. geometric collimators
x. tracking antennas
x. shaped beam antennas
"

"You will also gain valuable insight into the telegraphers equation,
... the steady-state A.C. Case... the Smith Chart...mutual impedance
...electrically small antennas...mobile and vehicular antennas...
reflections in space and antennas above the earth."

"Equiped with *this book*, you will have invaluable assistance for
mastering professional level antenna and transmission line work."

Table of Contents:

1. A brief History
2. Antenna math with a personal computer
3. Gain and Huygens Principle
4. Arrays of Sources
5. Aperture Distributions
6. Geometric Collimators
7. Off-axix Feeds and Phase Errors
8. Tracking Antennas
9. Shaped Beam Antennas
10. Unfilled Arrays
11. The Telegraphers Equation
12. The Steady-State AC Case
13. The Smith Chart
14. Elementary Radiators
15. Wire Antennas
16. Mutual Impedance
17. Electrically Small Antennas
18. Mobile and Vehicular Antennas
19. Reflections in Space and Antennas above Earth

4031. Personality Test (long)

Newsgroup: rec.ham-radio
Date: 1990-07-06 14:06:51 UTC
From: harrism@aquila.rtp.dg.com
Message-ID: <1990Jul6.140651.9297@dg-rtp.dg.com>
Source record: 10339

Here's a fun ham radio personality test. I copied it from the Raleigh Amateur Radio Society newsletter. I believe it originally came from the Laurel (MD) ARC "Feedback" newsletter (via Maria L. Evans, KT5Y).

Directions: Circle the letters of the sentences below that most closely resemble your attitudes about amateur radio. Then read the descriptions of those same letters to determine your personality profile.

A. Twenty meters is the band with all the action. It's propagation, overall characteristics, and the skill of it's regular operators epitomize the entire concept of Amateur Radio.

B. Twenty meters is full of California flakes and East Coast Kilowatts. Amateur Radio is a fraternity, and that fraternity only exists on 40 and 75 meter SSB.

C. Traffic handling is a living example of the history and traditions of Amateur Radio, and traffic handlers exude skills and decorum not found in the amateur community as a whole, and in general, are superior operators in all regards.

D. The high excitement and fever pitch of contest activities sharpen the endurance and stamina needed in emergency operation. Contesting is where it's at.

E. Amateur Radio has few unexplored ares, few real operating frontiers. UHF is one of the last of these outposts of research and exploration.

F. Amateurs have a duty to serve their community in emergency situation. Consequently, each amateur should be prepared that he/she may be called upon to render service above and beyond the call of duty.

G. Personally, I find the traditional modes of Amateur Radio communication quite boring. Amateur Radio's only future is in the growing number of specialty modes and new developments in amateur communication.

H. As a young person involved in Amateur Radio, I find that I am often confronted with cultural gaps in my hobby.

I. Too many hams these days are technically inclined to the point that they aren't good conversationalists. I find the friendships that I've gained via Amateur Radio the most rewarding part of the hobby.

J. Just as women in today's world are breaking into traditionally closed areas, today's YL is also becoming more involved in amateur activity. As one of this new breed of YL, I find the men and women of Amateur

Radio exciting and challenging.

That's it. End of test. Now score yourself!

A. You are fat, middle aged, and smoke cigars. A real DX fiend, you own stacked monobanders at 150 feet. King Hussein and Father Moran know you on a first name basis. When you key the mic, the power company declares a peak power emergency.

B. Your idea of state of the art equipment is an HW-101. You own a NCX-3 or a Hallicrafters of some sort. You and your cronies make an 8 KHz wide dent on the upper end of 75. Your only knowledge of the word "splatter" is what bugs do on your windshield. On SSB, you use a chrome plated D-104 lollipop mic. For your annual CW QSO, you use a bug set to send dots at 65 wpm, and dashes at 5 wpm. When people can't sleep, they tune to 40 and listen to you rattle about the "good old AM days."

C. You are basically nosy, and get secret thrills out of reading the traffic that you pass. Your obsession with line noise borders on paranoia. You fantasize about using thermonuclear devices to eliminate all your neighbors' household appliances, and strangling the 75 meter roundtable geezers with hardline.

D. You wear plaid shorts, black socks, and loafers to hamfests. Your call tag has little blinking LEDs on it. Children in your neighborhood get spending money by shoveling out aluminum beer cans at your place that stack up on contest weekends.

E. You think that two meters is for peasants. Your house looks like Mission Control in Houston. Truth is, you have gear for every band above 440, but no one to talk to. People with pacemakers should not tour your shack.

F. Disaster is a turn on for you. You love to jump in your car and follow fire-engines and ambulances. You took every kind of first aid class the Red Cross offers in hopes of becoming a hero. You hover over the local repeater like the Angel of Death.

G. Your shack looks like the cockpit of the Space Shuttle. For X pieces of radio equipment, you have (2*X) pieces of accessory gear, and (5*X) sets of interface cables. It takes you 30 minutes to change modes. In an ordinary garden variety ragchew, you are a total conversational geek.

H. You parents hope that Amateur Radio is just a phase you'll grow out of. You lose points with dates by leaving the two meter rig on at the drive in movie. You tell your friends that you'll be on MARS this afternoon, and they ask if you can get them some of whatever your on.

I. You regularly call CQ on top of BY1s. You call home on the autopatch and your spouse divulges your darkest secrets on the repeater. You have an impressive collection of "borrowed" QSTs. Last week, your neighbors hired a Gypsy to curse your tower.

J. Strange old men call you "honey" on the air. Everybody wants your QSL for WAS-YL. At hamfests, XYLs fume when you buy tickets for both the afgan and the TS-940. While discussing erotic subjects like the Russian Woodpecker, these same XYLs drag their husbands away from you. Sometimes you wonder if these gals are going to get together and buy you a call sign hat with a scarlet A on it.

"As you probably have now discovered, NOBODY won this one!"

Many receiver voting systems exist; most work upon the principle of encoding the received signal strength (or s/n ratio) at the receiver site and carrying that under the signal on the link to the voting site.

Some use various PL tones and divide the signal strength into two or three levels - strong, moderate, weak - and send an appropriate tone.

Others use a series of audio tones around 2500 Hz or so, and notch them out of the system at the voter.

Still others transmit the strength separately on another channel - most commonly done when there are several clusters connected by microwave, like the City of San Diego does.

This isn't that hard for a ham to build. I can do the PL flavour with just two chips at the receiver: A set of simple comparators (like the 4-in-a-can LM339) watch the signal strength, each set to a laddered level, and go to a priority encoder (like an LS148), with the output from the encoder driving the bottom bits of a simple PL encoder like the SS-32. Voila, you are now encoding the signal strength on the link.

At the voter site, you need a bunch of PL decoders (n per receiver), and you have a uP that samples all of them and decides which to select for feeding the transmitter. The nice thing about the uP is that the circuitry for it will be simpler than doing it with discrete logic, and you can do such things as add hysteresis to avoid chattering between receiver sites.

Disadvantages: it's an A-1 prime pain in the ass to get the audio to sound good and consistent across all those links; and the PL decoders are slow to respond so that the voting system won't act like a diversity setup - it's incapable of following mobile chop, for example.

The person who makes and sells these for the ham market gets to deal with any patent issues.
- Brian

Diana, you're certainly right about Field Day. However, I was talking about VHF Contests, not FIELD DAY. Besides, I don't consider Field Day a contest, it's more of a communications exercise, even though it's run like a contest. I long for the day when the Field Day exchange is changed to something a bit more meaningful to emergency communications, something that will require a bit of challenge to copy! And something that could be checked for accuracy. I sure wouldn't want some of the ops I work year to year in Field Day copying priority traffic, especially medical traffic. There are really lots of ops out there who don't seem to hear well, even when signals are strong. And even when things are said phonetically. But I digress.

Anyone who pays attention to VHF contesting surely recognizes K1TR as having operated from Mt. Wachusett since the early 1980's.

Sorry to burst your bubble, Diana. Just wanted to set the record straight.

[rest of article deleted]

The key combos don't seem to work on a IC-2SAT. And the following one:

>--
>LIGHT + FUNC + V/M RECEIVER MODE (All Band) All Band - no Tx
>--

will reset your cpu. (there is no "V/M" on the 2sat, only CLR, which is Memory -> VFO mode, and MR which is VFO -> Memory mode. I used CLR instead of V/M and got a reset -- oh well, fortunately I had all those repeater freqs written down.)

...or because all his available funds are tied up elsewhere, like a real Unix computer to put on the packet network.

Face it, Gary...not all hams are rich enough to put money into high-powered radios for every car and base stations for every band. Some of us have other things to do for the advancement of the art.

> Radio public at large and CQ's readership?

Well, the "Big Three" US automakers lost billions of dollars doing just exactly that, once they had carefully crafted the market research organizations in such a way that they confirmed exactly what was already believed. Instead, the Japanese came in and ate their lunch, and they are STILL having difficulty coping with reality.

Businessmen, being human, often become quite attached to what they think their business ought to be and ignore what the market is trying to tell them. Perhaps it is therefore pointless to try to convince CQ to become more technical, but on the other hand, perhaps even K2EEK can be convinced if his market yells loudly enough.

Does anyone have the addresses for any of the following hams:
Kirk Bailey N7CCB, Robert Larkin W7PUA, or Gary Oliver WA7SHI.
(or are they on the net here?)

They wrote a paper for the '88 Microwave Update entitled "TNT for 10 GHz
(The Tuesday Night Transverter)".

I would like to get in touch with any of them to see what design changes
have been made in the past 2 years.

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

Hello I wasn't sure if this was the right place to submits this but...

I was thinking of buying my dad Sony's new worldband radio, for the novice. At first glance it seemed pretty nice. My dad enjoys being aware of current events and also likes new toys. Is a world band radio a good way to satisfy these two needs????

Also, are there enough stations around the world which broadcast in English so that my father could understand them???

I would apprieciate it if someone could adress my questions
Thankyou for your time
Fred

I can understand and excuse the cop whose Motorola radio battery was shorted by loose ammunition (and after a chuckle, feel sorry for him). My guess is that most cops know nothing about the technical aspects involved and, unless someone tells them specifically not to mix exposed battery contacts and conducting materials, they wouldn't think of the danger. Hams are another matter however. Maybe we ought to include a question or two in the writtens for all license categories about battery charge levels, rates, internal resistances, discharge rates, and the like. :)

73,
Dube Todd N5PDK

4044. DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 26/90 VOM 06.07.1990

Newsgroup: rec.ham-radio
Date: 1990-07-06 21:50:12 UTC

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 26/90 VOM 06.07.1990

TRIER:

Der langjaehrige Redakteur des DX-Rundspruchs Hans-Georg Goebel, DK1RV, hat das DX-Referat aus persoenlichen Gruenden gebeten, den DX-Rundspruch in neue Haende zu legen. Die deutschen DX-Amateure sind DK1RV zu grossem Dank verpflichtet fuer die zuverlaessige Gestaltung des DX-Rundspruchs in den vergangenen Jahren. Gleichzeitig teilt das DX-Referat mit, dass der DX-Rundspruch des DARC und des RSV ab sofort ueber die Station Y62DXR abgestrahlt wird. Redaktion und Bearbeitung liegen bei Ulf Ehrlich, Y42MK. Der Rundspruch wird wie bisher freitags um 17:00 UTC auf etwa 3.745 kHz abgestrahlt. Die zentrale Lage der Rundspruchstation in Thueringen garantiert optimale Empfangsmoeglichkeiten zu allen Jahreszeiten. Der Rundspruchredakteur wird in naechster Zeit ebenfalls mit dem DX-Packet-Cluster verbunden sein, so dass aktuelle Informationen direkt verarbeitet werden koennen.

DUISBURG:

Am 27.06.1990 fand vor dem Oberverwaltungsgericht Muenster die Verwaltungsrechtsberufungssache Gerd Kautz, DL5JP, gegen die Deutsche Bundespost Telekom statt. Seit 1985 verursachte der Klaeger in verschiedenen Empfangsanlagen seiner Nachbarn erhebliche Stoerungen. Messungen der Funkstoerungsmessstelle Duisburg ergaben, dass sowohl die mit FTZ-Nummer versehenen Empfangsanlagen der Nachbarn als auch die Geraetschaften des Funkamateurs in Ordnung waren. Gemaess Paragraph 16 Absatz 4 DV-AFuG wurde dem Funkamateur zur Auflage gemacht, eine Sendeleistung von maximal 10 Watt einzuhalten oder ausserhalb der ortsueblichen Fernsehsendezeiten Funkbetrieb durchzufuehren. Bei der Verhandlung im November 1988 vor dem Verwaltungsgericht Duesseldorf wurde vorgeschlagen, die Leistungsbeschraenkung von 10 Watt in 100 Watt abzuaendern. Das akzeptierte seinerzeit der Klaeger. Diese abgeaenderte Leistungsbeschraenkung war jedoch aus grundsaetzlichen Erwaegungen heraus nicht annehmbar. Im Berufungsprozess vor dem Oberverwaltungsgericht Muenster wurde neu verhandelt, ob derartige verfuegende Massnahmen ueberhaupt berechtigt seien. Dank der guten Argumentation des DARC-Justitiars Boyke Dettmers, DJ4KD, gegen diese Leistungsbeschraenkung hob die Deutsche Bundespost vor dem Senat des Oberverwaltungsgerichts in Muenster die Ordnungsverfuegung vom 17.12.1987 und den Widerspruchsbescheid vom

12.12.1989 komplett auf.

DARMSTADT:

Im ersten Halbjahr 1990 stieg die Zahl der Amateurfunklizenzen in der Bundesrepublik Deutschland um 840 auf 64.013, d. h. um 1,3 %. Die Verteilung der 61.024 Individuallizenzen blieb prozentual gleich, das heisst 54 % in der Klasse B, 3 % in der Klasse A und 43 % in der Klasse C. Club- und Relaisfunkstellen verzeichneten einen Zuwachs von 2 %. 1.164 zivile Auslaender stellen weiter 1,9 % der Individuallizenzen.

FRIEDRICHSHAFEN:

Vom 29.06. bis 01.07. fand in Friedrichshafen die 15. Ham Radio statt. Mit 16.429 Besuchern aus ueber 30 Laendern, 160 Direktausstellern aus neun Laendern sowie der erstmals grossen Beteiligung aus der DDR wurde eine neue Dimension dieser Ausstellung erreicht. Ueber 31 % der Gaeste kamen aus dem Ausland. Gleichzeitig mit der Ham Radio 90 beging der DARC als ideeller Traeger das 41. Bodenseetreffen. Neben zahlreichen Vortraegen und Treffen wurden vor allem die aktuellen Probleme des Amateurfunks in der Bundesrepublik diskutiert. So warnte der erste Vorsitzende des DARC, Guenther Matz, DJ8BN, in seiner Eroeffnungsrede davor, allein aus wirtschaftlichen Gesichtspunkten heraus das 70-cm-Band zu Gunsten anderer Bedarfstraeger zu beschneiden. Ebenso verfolge man, so DJ8BN, die Belegung der Sonderkanaele im Breitband-Kabelnetz der Deutschen Bundespost mit grosser Sorge. Die Ham Radio 1991 findet vom 28.-30.06. auf dem Friedrichshafener Messegelaende statt.

TOURS:

Im Rahmen einer Montblanc-Expedition im August soll eine Amateurfunkstation vom Gipfel des mit 4.810 m hoechsten Berges Europas betrieben werden. Die Expedition wird zwischen dem 10. und 20.08. 1990, abhaengig von der Wetterlage, aufbrechen und mindestens vier Tage, bei gutem Wetter zwei Tage laenger, dauern. Dabei ist ein 24stuendiges Biwak auf dem Gipfel vorgesehen. Unter dem Rufzeichen F8UFT werden die Operateure versuchen, mit moeglichst vielen Funkamateuren in Kontakt zu treten. Als Arbeitsfrequenzen sind vorgesehen: 144,100 MHz in CW, 144,330 MHz in SSB, 145,550 MHz in FM, 145,350 MHz via Relais FZ8VHB, 145,725 MHz via Relais HB9G, 438,500 MHz in ATV mit der Rueckruffrequenz 144,170 MHz in SSB und 144,150 MHz in FM. Ausserdem wird eine CW-Bake auf 144,050 MHz installiert. Vom Basislager gibt es aktuelle Informationen um 21:00 Uhr Ortszeit auf 3.610 kHz in SSB sowie um 21:30 Uhr Ortszeit auf 3.545 kHz in CW. QSL-Karten gehen via FD1JMH.

DOEBRIACH:

Vom 21.07.-12.08. findet in Doebriach am Millstaetter See in

Kaernten/Oesterreich das diesjaehrige DX-Camp statt. Obwohl das DX-Camp in erster Linie fuer Freunde des Kurzwellen- und UKW-Rundfunks gedacht ist, sind auch Funkamateure sehr willkommen. Vom 29.07.-03.08. stellt die ADXB-OE eine Amateurfunkstation fuer Kurzwelle und UKW mit dem Rufzeichen OE8XBC zur Verfuegung.

FUNKWETTERBERICHT: (03.07.)

Der ausgepraegte periodische Verlauf der Sonnenaktivitaet, der sich seit Jahresanfang herausgebildet hatte und der mit dem Monatsrhythmus zusammenfiel, scheint nun zu Ende zu gehen. Ursache war eine sehr ungleichmaessige Verteilung der Aktivitaetsgebiete auf der Sonne. Ob diese Umorientierung eine Erhoehung der Sonnentaetigkeit mit sich bringen wird, laesst sich zur Zeit noch nicht abschaetzen. Der Anstieg der Sonnenfleckenzahl und der 10-cm-Strahlung, der Ende Juni begonnen hatte, setzt sich weiter fort. Am 02.07. erreichte die Radiostrahlung 252 Einheiten. Wegen Verzoegerungen bei der Datenzustellung liegen keine aktuellen R-Werte hier vor. Jedoch duerfte Ende Juni nach der Skala von Boulder/Colorado die Grenze von 300 Einheiten ueberschritten worden sein. Die Magnetik war bisher ruhig, allerdings sind schnelle Aenderungen dieses Zustandes jederzeit moeglich. Infolgedessen muss im Vorhersagezeitraum mit sehr wechselhaftem Funkwetter gerechnet werden.

BAUNATAL:

Fuer den Deutschland-Rundspruch beginnt jetzt eine mehrwoechige Sommerpause. Der naechste Rundspruch wird am 24.08. herausgegeben. Allen Lesern wuenscht die Redaktion eine erholsame Urlaubszeit.

Ende des DL-RS Nr. 26/90 vom 06.07.1990

Bearbeitung: DC7XJ

- BT vs. periods for punctuation,

BT seems easier to copy.

- one or two BT's at a time,

I send two when my brain is stuck for a way to say something with
the fewest number of characters :-)

- 559 vs 55N for the 2nd RST report,

5nn is "cut code", an alternate method for transmitting numbers.

- leaving out one callsign and just send DE callsign,

Some of us send so slow that we ID every time, or we may overrun the
10 minute limit. :-)

- the dit dit at the end of contacts.

I use this as an acknowledgement that I received the last transmission
after I've SKed.

In a very few days I'll be travelling through Cedar Rapids, Iowa.
Are there any historical vestiges of Collins Radio there--like
displays of old gear, a museum to old man Collins himself, etc?
I'm not interested in trying to see Rockwell/Collins, but thought
there might be something in the town or a little corner of the
plant devoted to the old days.

I'll be leaving on Sunday, July 8, so any quick responses would be
appreciated. I will read my e-mail on Saturday.

Cheers--Jim, K6ZH, ARPANET: price@nosc.mil

It is all very interesting, but where do those displaced go? I know that the
U.S. government, among others, makes use of that 6950-7000 slot.

Sb: Alinco DR-510 Cross-Band Rpt MOD

DR-510 - Vehicular Extender Modification

I discovered this modification the other day and wish to share it
with other 510 owners, I did it and it works for me!

I did not originate the modification and will NOT accept any
responsibility for any damage the may occur as a result.
(I won't myself. WA2ISE)

How to do it

1. Remove bottom cover

2. Remove 2 Phillips screws at corners of subtone board
(small board near center in front) and move the tone board out of
the way.

3. Solder an 16V electrolytic capacitor
(10MFD to 100MFD but best to use 40MFD to
50MFD) as follows:

A. Neg (-) lead to pin 8 on device (IC) labeled - M54959P
B. Pos (+) lead to pin 3, counting from left while facing front
of transceiver of the white 11 pin connector.

ANT Power cord
-----------------Rear----------------------------

```
l_l_l_l_l_l_l_l
l M54959P l
l_____________l (-)
l l l l l l l l------47uF+
/(+)
/
[][][][][][] [][][X][][][][][][][][]
```
------------------Front---------------------------

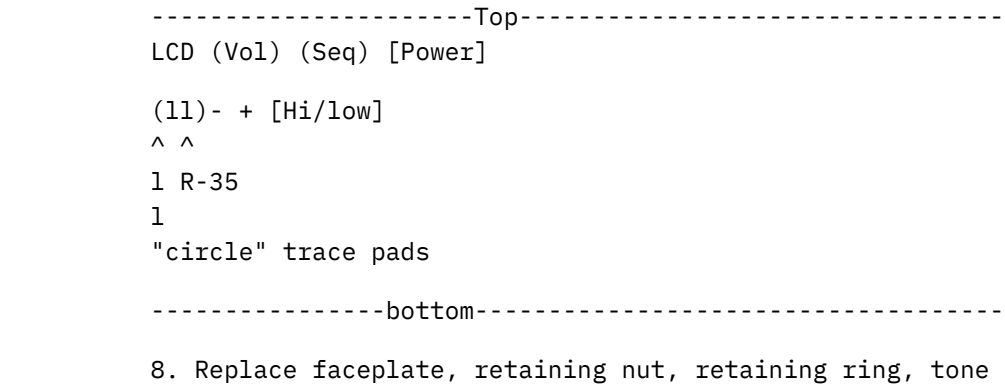
4. Remove top cover and faceplate of transceiver. Be careful of speaker wires!
A. To remove faceplate:
1. Remove main dial knob and retaining nut.
2. Remove mic. socket retaining ring.
3. GENTLY lift tabs, located approximately 3/4" in from each side,
on top of faceplate and "rotate" toward front of the transceiver.

4. When tabs are "free", turn transceiver over and repeat
the process. Remember - gently!
5. Set free plate aside.

5. Locate surface monnt device labeled R-35 on control board
(front of transceiver).
A. R-35 is positioned between, and slightly below, the squelch and
high/low power button. To the left of device R-35 is a "circle" trace.
inside the "circle" trace are two solder pads, one of which is already
soldered to R-35.

6. Bridge the unsoldered pad to the soldered pad inside the "circle" trace.

7. Short R-35



8. Replace faceplate, retaining nut, retaining ring, tone board,
bottom and top of transceiver.

Operation
1. Store different bands (2m or UHF) in VFO mode and Memory Channel 1-9.
Any thing you can store in memory 1-9, split, subtone enc,
subtone dec will work.
2. Store "DUAL" mode in VFO (Simplex) also it will accept subtone enc
and subtone dec.
3. Turn power off and then keep pressing the REV key, turn on the power
switch.
4. Audio Vol. control is your deviation control in repeater mode.
5. To return to normal operation turn off power then turn on again
without pressing any keys.

Notes:

The transceiver scans back and forth between the VFO and Memory until
it finds a signal then it locks on and transmits what it hears on the
other band. This scanning causes a slight delay when keying up as the
radio takes time to scan. I recommend the use of subtones when
possible so that the radio will not key up on noise and not allow
non-authorized personal to use your radio, the transmissions of which
YOU are responsible.

Good Luck, es 73's Rick N8KNJ

Note: I haven't tried this, proceed at your own risk. WA2ISE

4050. NASA Prediction Bulletins

Ok Jay, I admit I have a profound dislike for fighting marginal signals on a local repeater. Most of these problems seem to be related to using a HT with rubber duck in areas where they just don't work well.

I agree that not all hams are rich, Lord knows I'm not, but surely any ham worthy of the name can build a simple quarter wave ground plane antenna and permanantly fix it in a good spot at his home. And any ham should be able to install an outside antenna on his car and use it instead of the terribly inefficent rubber duck INSIDE the car.

There seems to be a mentallity in ham radio today that goes "The manufacturer put a duck on my radio and I don't dare change it."

If you have to rock back and forth in your easy chair to find the "hot spot" you need a better antenna and/or more power to properly work THAT repeater.

Hams to lose all UHF Freqs?
July 1, 1990

Sorry for the alarmist title but often it takes a knock
on the head to wake up.

As you know, ham radio recently lost 2 MHz of spectrum at
220-222 MHz. But did you know that in roughly the last TEN
years, ham radio lost an astounding 91 MHz! That works out
to 9 MHz per year from 1980 to 1989, making 1989's loss of
220-222 MHz a very good year for ham radio.

Between 1980 and 1989, the U.S. Amateur Radio Service
lost forever, a total of 117 MHz of spectrum in the VHF/ UHF
region alone:
420-430 MHz north of 'Line A'.
1215-1240 MHz .
2310-2390 MHz.
220-222 MHz.
The only good news is that we did get 902-928 MHz, for a net
loss of 'only' 91.00 Mhz.

What is so frightening about all of this is that the strong arguments we presented to the FCC to save 220-222 MHz were not good enough - and do you seriously believe that we can provide better arguments to retain our holds at 902, 1240, 2400 or even 440 MHz?

Fast Approaching Demands on the Spectrum

Cellular telephones and high definition TV (HDTV) have all received a great deal of press regarding their growth and demands on spectrum. Lesser known are a number of new technologies that will start to come on line during the coming decade and which will demand their own frequency allocations.

Coming soon is the Personal Communications Network, which is best described as a 'micro cellular' system. The idea is that cells will shrink to less than 1 kilometer in size (in some cases maybe a hundred meters) as this is the only way that huge numbers of portable telephones can be accomodated. Conceptually every city block, every shopping center, every business will have a cell site. The single 'cordless phone' that you use at home will operate at your business, at the airport or while shopping. PCN is for real: A U.S. company has received FCC approval to build a pilot system on the east coast. Some systems are already operating in the U.K.

Even cellular is already maxed out in many areas. Today there are 3.5 million cellular subscribers with forecasts that the number will reach 28 million subscribers by 1997. That means that roughly 1 out of every 10 people in the U.S. will have a cellular telephone.

The cellular industry is looking to new technologies, especially digital cellular that will enable them to multiplex multiple signals, and hence, make better use of the available spectrum. Undoubtedly, they will want more spectrum.

Motorola has announced plans to build a world-wide satellite and terrestrial based cellular phone system. Using a large number of low earth orbit satellites, the system will provide worldwide telephone service from rural and remote areas of the entire world. When the user travels into a metropolitan area, the system will automatically switch from satellite

operation to the terrestrial cellular phone system.

Before the end of this decade, Digital Audio Broadcasting will likely make its debut. Just as FM broadcasting has nearly replaced AM radio, DAB may do the same, providing CD quality audio broadcasts. This digital broadcasting system will soon be seeking a dedicated frequency allocation, allegedly in the 1.2 to 2.0 GHz range.

And if that were not enough, virtually every single radio service currently in existence is seeking additional allocations.

The Impact

Last month (June 21, 1990 news report), Rep. Edward J. Markey (D-MA) introduced legislation forcing the Department of Defense to give up some of its frequencies. On June 18th, the House committee on Energy and Commerce unanimously approved a bill that would force the U.S. government to give up its hold on large segments of spectrum that it now holds.

Is this good or bad? Considering that ham radio shares frequency allocations with military radar allocations (go take a look at Part 2 of the FCC rules), this means that ham radio could easily lose significant chunks of spectrum. Only 430-440 MHz is an international ham radio allocation; 440-450 is US domestic only and is shared with military radar, as are 1240 to 1300 MHz.

Meanwhile, the Bush adminstration has gone on record saying that it favors the concept of selling 'access rights' to the spectrum. Industry analysts have said that market prices for 1 megahertz of prime spectrum might easily fetch 8 to 10 BILLION DOLLARS. Its hard to see how ham radio can compete with such dollar valued market forces.

Today, approximately one half of the FCC's employees are lawyers. How much do you think the FCC's lawyers value ham radio's contributions to packet radio technology, low cost PACSAT satellite technology and other breakthroughs or even the unbelievably extensive public service of volunteer ham operators?

If all this isn't gloomy enough, restrictive antenna ordinances (the private ones NOT covered by PRB-1) are establishing defacto prohibitions on HF ham operations, at the same time that we are losing our VHF and UHF allocations.

Do we need VHF or UHF frequencies? You had better believe we do! Wide band modes such as ATV and high speed packet are only allowed at UHF frequencies. Packet networks and conventional voice repeater links and control circuits operate on these frequencies. Even if you do not personally use these frequencies, chances are good that the FM voice repeaters or the packet BBS station that you rely upon, all use these frequencies. Further, our future growth and experimentation of new technologies absolutely depend upon the availability of adequate spectrum. Even if you don't see the personal need for these frequencies, the Amateur Radio Service as whole is utterly dependent on these allocations for its future existence.

The Solutions?

Part 15 devices to save us?

Most hams do not realize that virtually all of our VHF and UHF bands are shared allocations, generally allocated to other services such as military radar. In effect, these are 'junk' bands that are incapable of serving the needs of paying customers.

We also share several UHF and SHF bands with unlicensed Part 15 devices, and strangely, the 'junk' nature of these bands may actually save them for ham radio. For example, 902-928 and 2400-2450 MHz are shared 'junk' allocations used also by Part 15 and Industrial, Scientific and Medical transmitters. For example, ordinary microwave ovens operate at 2450 plus or minus 50 MHz.

Right now, nearly a dozen companies are selling or will shortly be selling 1 watt high speed data transceivers in the 902 MHz band. These units operate spread spectrum and have claimed ranges of up to 10 miles; external antennas are allowed. Meanwhile, other companies are building digital cordless telephones on top of this technology. Since these data transceivers operate at a 200 kbps rate, its easy to use them as a basis for long range digital cordless telephones. I suspect we will see the first digital cordless phones, with a 2 to 5 mile range, costing $400-$500 dollars by mid-1991, with shipping units by Christmas of 1991.

Other applications include non spread spectrum, very short range, wireless connections between VCRs and TVs throughout

the house.

Path: WD6CMU!W6CUS!KA6FUB!N6ECP!AL7IN!WB7VMS!N7DXT!N7JQK!W0LVJ!KD7NM

Fortunately, the FCC made it very clear that the Part 15 devices are 3rd class citizens here and must put up with interference. Especially noteworthy is that these Part 15 devices will be interfering with each other! In effect, the FCC has recognized that these are 'junk' bands and this may actually help save these bands for ham radio use too (but note that we may already have lost access to 920-928 MHz - see below).

Furthermore, there isn't any reason why a licensed ham radio operator couldn't add a 50 watt amplifier to one of these units and end up with a low cost, mass produced high speed digital data network - unless of course, the FCC bans the sale of 900 MHz amplifiers, just as they banned the sale of 10/11 meter amplifiers!

Increase our Numbers

Ham radio must increase its number of licensees. Between 1980 and 1990, ham radio grew at an average annual growth rate of 2%. That compares to growth in other radio services of many tens of percent per year. Since we are all competing for the same spectrum, guess who wins the request for more spectrum and guess who loses?

The issue over a no-CW class of ham radio license isn't one over whether or not a CW-illiterate license will obliterate ham radio. The choice is whether or not we want to share our VHF and UHF frequencies with licensed ham operators who have passed a technical exam but no CW test, versus losing those frequencies within the next few years to Landmobile and other services who are starving for allocatinos. Most of us would at least like to continue to have access to some of that spectrum versus having industry slam the door in our faces.

The FCC, actually, has been extremely supportive of ham radio. But, based on our relatively low numbers, they cannot continue to justify our radio allocations against the demands of other services. The CW-illiterate license proposal may be their last opportunity for the Amateur Radio Service to kick us into significant growth. If this fails, or if the growth fails to materialize, there are literally hundreds of other

services waiting for those frequencies.

The ICOM advertising department has perhaps seen another alternative to help spurn ham radio growth: during the past year or so, their ads have deliberatly emphasized hamming as an activity appropriate for the entire family. Not just Dad, but Mom and the kids too. Maybe the view of hamming as a life-of-leisure, sit back and talk to the world for hours on end, has become dated. Today, when Dad and Mom both work just to meet the mortgage payments, hamming is way to keep in touch and to enjoy social contact on the daily commute. We need to explore new concepts as to what, exactly, ham radio is going to become in the coming decade and in the next century.

Turn the ARRL into a political organization?

The ARRL must increasingly turn itself from a fraternal organization to a politically active organization, similar to the Sierra Club or the Aircraft Owner's and Pilots Association. These organizations both do an excellent job of motivating their memberships to write Congressman and to take an active role in preservering either the environment or access to the nation's airspace, respectively. The ARRL is currently very poor in this regard and needs to focus attention in QST and elsewhere on the real life political issues facing ham radio today. Most hams are largely oblivious to the technologies and political forces that will be raining upon us during the next decade.

The ARRL is our only national representative. I fear that in the next 1 to 2 years, ham radio may lose additional UHF frequencies (portions of 902-928 MHz, especially 1240-1300 MHz, very likely 420-430 over the rest of the U.S., and potentially even 440-450 if military radar goes away) and that this could result in a backlash against the ARRL, and the rise of a second national ham radio organization. It is not at all clear that 2 voices would be better than one.

What to do?

I strongly urge you to discuss these issues with your ARRL Division Director and ARRL Section Manager and certainly

other ham operators. Let's get the ball rolling and let's
meet the challenges of the 1990's head on. Most of all - DO
SOMETHING! Ask yourself that famous question: What are you,
personally, doing to help promote Amateur Radio?

I welcome your thoughts and comments,
Ed Mitchell
KF7VY @ KD7NM.#WWA.WA.NA.USA

P.S. During the weeks that I have written this note, the
'hot' topics on the packet BBS network have been:
- code versus no code
- handicapped access without 13 or 20 wpm code
- closed repeaters
All of these are important issues. However, I fear that we
are putting an enormous amount of emotional enery into
arguing about the quality of each tree - while the entire
forest is rapidly being cut down to make way for a new
development!

Please, let's get some constructive dialogue going on the
basic issue of ham radio existing at all!

----------END...AR----------

PLEASE REpost as you choose.....
tnx,

4056. loss of frequencies

Newsgroup: rec.ham-radio
Date: 1990-07-08 00:51:20 UTC
From: oo7@ut-emx.UUCP
Message-ID: <33530@ut-emx.UUCP>
Source record: 10362

millard@eos.UUCP (Millard Edgerton) says:

The following was posted to Packet Radio by Ed Mitchell, formerlly [sic]...

As you know, ham radio recently lost 2 MHz of spectrum at
220-222 MHz. But did you know that in roughly the last TEN
years, ham radio lost an astounding 91 MHz! That works out
to 9 MHz per year from 1980 to 1989, making 1989's loss of
220-222 MHz a very good year for ham radio.

Between 1980 and 1989, the U.S. Amateur Radio Service
lost forever, a total of 117 MHz of spectrum in the VHF/ UHF
region alone:
420-430 MHz north of 'Line A'.
1215-1240 MHz .
2310-2390 MHz.
220-222 MHz.
The only good news is that we did get 902-928 MHz, for a net
loss of 'only' 91.00 Mhz.

This is undoubtedly a serious problem, but it's downright silly talking
about how many MHz we have won or lost. Fractional frequency is all that
counts. I would gladly give up 20 MHz of allocation around 2300 MHz in
return for even a solid 20 MHz elsewhere - e.g. everything from 10-30 MHz.
Or even better, everything from 1-21 MHz (0-20 MHz would be fine too).

If you believe this line of reasoning, the powers that be could wipe out
our 14-14.35 MHz band and give us 2390-2391 instead - "hey look, we gave
you nearly 3 times as many MHz, be grateful".

I don't mean to belittle the problem, but I can't read >300 lines of
posting that starts out with an argument like that. It's just asking
not to be taken seriously.

end pet peeve mode...

Why?
>
> For one thing, unless your ham shack is sitting right at ground level
> with a VERY short ground cable, the equipment won't be at RF ground in
> any case (4 feet is 1/8 wavelength at 30 MHz). On VHF/UHF, where the
> TV channels are, it's even worse.

I have my radio room in the corner of the basement for just this reason.
My ground system is a series of commercial ten foot ground rods in treated
soil, just outside the basement wall. They are tied together with wide
copper strap, which runs through the wall, and is bolted to the chassis of
my linear amplifier, antenna tuner, and exciter.

You will never get your ground connection EXACTLY AT ground, but the
closer the better.
>
> For another thing, so what if you COULD get the station equipment right
> at RF ground potential. It's the antenna that does most of the radiating,
> if your antenna system is working correctly.

Let us suppose that you have various filters in the signal chain, including
a bandpass filter at the exciter and a low pass filter between the
exciter and the final amplifier, and at the output of the linear. Part of
those filters involve capacitors which shunt energy to ground. Isn't it
better to have GROUND connected to the ground side of the filter, rather
than nothing at all?

>
> Seems to me that shielding, filtering, and reducing the RF field in the
> vicinity of the TV set and antenna are the things to try.
> Grounding is a red herring.
>

Why?

How effective is a filter which includes a ground as part of the design,
if you leave it UNGROUNDED?

There are many Sonys. Were you thinking of the ICF-SW1S?

> At first glance it seemed pretty nice. My dad enjoys being aware of current
> events and also likes new toys. Is a world band radio a good way to satisfy
> these two needs????
The SW1 may be a great toy since it's sooooo small.
Shortwave listening can be lots of fun.

> Also, are there enough stations around the world which broadcast in English
> so that my father could understand them???
Yes. I think there are "enough",.
but I don't know if your father understands English :-)

> I would apprieciate it if someone could adress my questions
> Thankyou for your time
> Fred

I would also recommend getting him the book: "Passport to World Band Radio"
ISBN 0-914941-20-8 at your local book store. Don't be a fool -- buy it first,
before you buy the radio. (sorry about using the f word, but you really need
the book)

Richard Artz / N0LZR / 303-229-2036 / richard@hpfcww.fc.hp.com
(NO, I don't have a thing to do with the book, I just recommend it highly.)

4061. Re: HAM RADIO IN DANGER

Newsgroup: rec.ham-radio

Message-ID: <9007080829.AA25478@ucsd.edu>
Source record: 10368

A few months ago I posted a message asking for help re: a Motorola MX330S
which I picked up at the Dayton Hamvention this year.
Someone was nice enough to answer - letting me know that it can be programmed
on the ham bands for free - however left no TELEPHONE NUMBER where I can get
hold of this person. The return address on E-Mail for some reason did not go
through.
The person who posted the reply was part of the Motorola Ham Group in Florida.
Are you reading this ??? Or if anyone out there in Net-Land can help with info
as to where I can program the PROM of the MX330S - Please let me know.
Thanks on 73,
Richard Harel

4063. E-Mail via Radio/MicroWave?

Newsgroup: rec.ham-radio
Date: 1990-07-08 16:48:00 UTC
From: D1749@applelink.apple.COM
Message-ID: <5969518@AppleLink.Apple.COM>
Source record: 10369

Does anyone know of a cheap way to connect multiple sites (200-2000) within a 15 mile radius to a central site using radio/microwave are some other sort of technology? What I'd like to do is setup a multiline (16 lines) E-Mail System in Metro Manila, and have the modems (1200 baud is fine) connect to some sort of radio/microwave rcver/txmitter, that sends data through the airwaves onto some low-cost (>$1000) rcver/txmitter at the remote end. Ideally, the system should work fine even during thunderstorms.

Why not just do the obvious thing and use phone lines? Because the average waiting time here (for a line) is about 5 years! And if you think that's bad, consider this: PLDT (phil. long distance tel.) service is so notoriously slow, phone lines have actually become a commodity and go for about US$1,500 per line. That's about 3x the income of an average Filipino! Why just today, I was talking to a friend who's had her application in since 1967 and only last week had the line allocated - honest!

If anyone has any suggestions, please send me some E-mail directly, as I haven't subscribed to this group!

thanks,
Joel Disini

> or fb ratio, not both simultaneously) on any frequency on the band.

My 3 element 20 meter Yagi has a director and reflector that are each a continuous piece of aluminum tubing. How would a variable capacitor tune these elements?

> If the tuning unit has sufficient range, it should be possible to
> operate the beam on 20, 17, 15, 12, and 10M by retuning the elements
> for proper resonance. The antenna would have increasing gain as
> frequency is increased.

To be effective, a Yagi requires precise spacing in terms of a fraction of a wavelength between each element. If I am using .18 wavelength spacing from the driven element to the director on 20, that becomes .36 wv on 10 meters. Also, my .507 wv driven element on 20 becomes over one wavelength long on 10, no matter how you tune it.

I see problems!

n>
> This brings up several implementation questions for further research.
>
> 1) What sort of tuning unit?

A MAGIC one! :)

>
> Any other ideas?

How about just buying a commercial triband Yagi with traps? Or perhaps that Mosley model that works all the WARC bands in between? It should work a LOT better!

> " " 13.0020____KPH (B. Parnass
> " " 17.0165____KPH (B. Parnass
> " " 6.5005____KPH (B. Parnass

KPH is a maritime costal station located in the San
Francisco area. (Since the transmitters and receivers are
generally seperated by 10-200 miles for such stations,
"location" is not a single value.) Facilities at these
stations are often quite impressive; worth seeing if you
happen by one. These stations relay traffic (eg, telegrams)
to and from shipboard stations on a commerical basis. When
not in QSO with a ship, they generally transmit a continuous
loop of CQ or VVV, callsign, and the frequencies that they
are montioring. Thus, QSX 4 6 8 12 16 22 MHZ means KPH is
currently monitoring (and probably simulcasting) on its
assigned frequency in each of those 6 bands. Ships reply on
paired frequencies generally about 100-200 khz removed from
the shore frequency. Ship stations are generally half
duplex or breakin, while the shore station is generally full
duplex. The purpose of the loop is to allow a ship station
to select the frequency with the best signal at a given
time. (Wouldn't that be neat for working DX?) It also keeps
intruders off the frequencies. In addition to the CQ loop,
you will hear traffic lists (lists of 4-letter ship
callsigns) for whom the station is holding msgs, and weather
reports. While the CQ loop may be slow, most of these ops can
send and copy CW fast enough that it sounds like RTTY,
probably while eating lunch and carrying on a converstaion -
these guys are pros.

Unfortunately (at least for CW buffs), CW comms for maritime mobile services are rapidly dying out, having been replaced by low-skill automated RTTY and satellite comms. You will hear less and less of these stations in the future, and the MM ship-shore frequencies will probably be reallocated to other services.

For detailed info on these and other utility stations, I recommend Klingenfuss' book "Guide to Utility Stations", available from ham store and mailorder bookstores. For example, he lists about 23 frequencies for KFS. He has a callsign to location cross ref which is neat for figuring out where things you hear are. There is also a lot of freq allocation info, including ship/shore frequency pairing.

4066. Kenwood TS140s computer interface ?

Newsgroup: rec.ham-radio
Date: 1990-07-08 20:26:10 UTC
From: daveegan@dhw68k.cts.com
Message-ID: <1990Jul8.202610.2283@dhw68k.cts.com>
Source record: 10370

Hello fellow amateur/netters. In my quest to avoid "voodoo radio" as quoted by others, I've been seriously eyeing some information that came over the net in April, 1990. It was a quick and dirty sheet of parts needed to construct a computer interface for a Kenwood TS440s. The instructions told of the main parts needed, some various jumper changes, and the instructions to send the radio to control it from the computer. This originated from Mark C. DiVecchio - K3FWT and was put on the net by Thomas Brown - KA2UGQ.

My problem is: I have a Kenwood TS140s and am very inexperienced in designing stuff (electronics).

I hope somebody out there has done this hardware for the TS140s and can give me a little more help. I don't mind learning how to do it (that's why I'm interested), but I realize that my ignorance can cause damage. Software is my domain. If somebody has the tips, or wants to work through it with me, please mail me. If I anyone wants responses on what I find, please mail and I'll re-post to the Net.

Thanks in advance.

Let's get REALISTIC!

As most everything else slowly moves off shortwave, there will be lots of this spectrum for grabs. But the Shortwave Broadcasting service is going to end up with most of it. Hams themselves are going to get some, but nothing near 10 or 15 Mhz.

As a shortwave listener, I actually look forward to more SWBC spectrum. As a ham I'd also like to see us get more, even though my interest in shortwave is primarily as a listener. Nearly ALL of my hamming is on VHF and above.

However, amateur radio is going to be judged. Those who are making the decisions to allocate spectrum are surely not interested in allocating any spectrum to the "shout, cuss, and QRM" service. While VHF and up has these problems as well, we hear them in HF, and everyone else in the world does, too.

4068. ICOM R1 - The Final Chapter

Newsgroup: rec.ham-radio
Date: 1990-07-08 20:39:44 UTC
From: paulf@jessica.Stanford.EDU
Message-ID: <1990Jul8.203944.12979@portia.Stanford.EDU>
Source record: 10439
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Well, folks, I'm back from Japan, and I have a few things to report on the ICOM R1 story. First of all, if you go to Akihabara, you will not find an R1 for sale. You'll find a very few R1s as display models, with the price crossed out, and some kanji (usually written in red) amounting to "waiting list several months long". According to the manager at T-Zone, Akihabara as a whole receives fewer than a dozen R1s per week. JH1GNU and I went to about a dozen stores before giving up that weekend.

Thus, ICOM's pleas about inadequate production would seem to be substantiated. This does not rule out, of course, the rumors regarding UNIDEN's patent lawsuits, but at least ICOM is being truthful, if not candid.

For those of you still salivating, here are the receiver specs:

2-25 MHz:
AM 1.6uV
FM 0.79uV
WFM 6.3uV

25-905 MHz:
AM 0.79uV
FM 0.4uV
WFM 3.2uV

The PLL does lock, and the radio does work from 100KHz to 1.3GHz.

That would be all I had if I hadn't stopped again in Akihabara on my way to Narita. It was raining heavily, and I stopped into this little place by the tracks just to get out of the rain. I strolled down the aisles, looking at all the parts, and came across an R1 on display. Just for grins and giggles I decided to ask about it, in my best Japanese (which is very bad). The kid behind the counter smiled, and pulled out a calculator. "Cash?" he asked. "VISA" I replied. After putting on the 3% consumption tax, it came to Y47000. Naw, he's just teasing me, I thought. "In stock?" I asked. "Hai". "Box?" He digs out the box, I look in, and there it is. "Sold", I said. So, for somewhat less than $300, I nabbed one.

I'll put out a real review in about a week or so, but I have noted something of an intermod / ACI problem. However, it does pull in Radio Australia at night, with a rubber duck.

From: mleech@bcarh342.bnr.ca
Message-ID: <1990Jul8.210023.22483@bnrgate.bnr.ca>
Source record: 10372

I'm the middle of design/fabrication of a 21cm interferometer for
Amateur Radio-Astronomy. I find that I need a 1350MHZ VFO to generate
a 70MHZ I.F. for the input frequency of 1420MHZ.
I'm considering several L.O. designs:

PLL-synthesized VFO with stripline oscillator and a doubler.

Conventional VCXO with several multiplier stages.

135MHZ VCXO with a single S.R.D. comb generator, and a couple of stages of
BandPassFiltering/Amplification to pick off the appropriate harmonic.

I only need a few megahertz (let's say 2.5MHZ in either direction) of tunability.

Having never built such an L.O. before, I'm hoping someone can point me at
a resonably simple design that I can steal ideas from, or simply "scale"
to the desired frequency.
Thanx in advance

No. I don't think of ham radio as an antique wireless museum, which is basically what happens on HF. I think of ham radio as a National Park of the Mind where the curious can go adventuring on the frontiers of technology. THAT is happening on VHF and up.

SB RTTYDX @ RTTYDX $RTDX0706
RTTY DX Notes, 1of3, 7/6/90

RTTY DX Notes for Weekending 6th June 1990.
Part 1 of 3.
BID: $RTDX0706

I have noticed of late, and for some time, that a lot of people are
not using their callsigns during a QSO. One sits for many minutes
watching a QSO (it maybe good DX) only to see it go back and forth
with no calls, and even in the signoff it is a case of bye bye, crash.
I am talking about RTTY and AMTOR. I am not sure about packet. But
where have all the callsigns gone? In VK we have to give our calls
every 10 minutes. Not all of us do, but we should, and that is why we
have a callsign so that people can identify us.

We wish to thank the following for sending us DX information for the
past week. Thank you all. The DX notes without you would be a blank
page. Thanks to I5FLN, I5ICY, I5IOQ, JG1NDB, JH1BLV, JH1QDB, OD5NG,
TG9VT, W2JGR and the Tri-State DX Association VHF packet cluster.

RTTY DX Notes for Weekending 6th June 1990.
Part 3 of 3.
BID: $RTDX0708

Notes of Interest.

VK0DS, Dave, is situated at Mawson Base. He has just started on AMTOR, and is anxious for contacts.

RF1F/UA3TT is about to leave his present QTH, but will be back in September.

P29BT has informed that he hopes to be up on RTTY shortly.

Seychelles. JG1NBD says that he will go to S79 from September 13th to 17th and will be QRV on RTTY.

Ogasawara. JH1QDB informs us that he will sign /JD1 from September 23 to 30th and will be active during the W.W. RTTY Contest. This will be a mainly RTTY operation. QSL to his home address.

Sudan. WZ6C currently holds ST4/WZ6C call and is based in Khartoum. He is looking for a loan of a PK232 or something that will get him on RTTY. He will return to Sudan around 10th July, so if any help is forthcoming, contact him on phone/fax 615-323-4433.

Malpello. HK0 is hoped for in January. RTTY operator will be HK1LDG, who needs assistance with gear, TONO, rig, aerials, etc. Contact him at Box 2624, Baranquilla, Colombia.

I do not want to dishearten you all, but Gin San ,JA1ACB, has just received accreditation for 301 confirmed. He also holds cards for 6 more confirmed, with 5 to come. Congratulations Gin San. Oh well, I think I will stop now, with just over 250.

GL DE DX1.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

WO-18 CCD CAMERA IRIS SETTINGS EXPERIMENTS

For the past several weeks, WEBERSAT-OSCAR-18 (WO-18) has been sending three to four pictures daily from outer space. This continuous stream of imaging data has been part of an ongoing experiment by the students at Weber State University to characterize the amount of natural light which enters the CCD camera for the various iris settings. The goal of this experiment is to find the proper settings for the camera iris for a particular light level in order to improve the overall picture quality.

With the integration of the on-board Earth sensors in the current software, the occurrence of overexposed pictures or totally dark pictures taken when WO-18 isn't pointing at Earth is no longer a problem. Chris Williams, WA3PSD, says that the painstaking task of manually setting the iris from the ground and observing the results will help software engineers in the future as they continue to understand the CCD camera operation. "The early days of random picture taking are gone," according to WA3PSD.

There are 256 possible iris settings which ground controllers can command. A "zero" setting completely closes the iris and a "255" setting opens it wide. The result of this experiment will be a look-up table in WO-18's software which will say "for this light level, use this iris setting." For those wishing to take part in this experiment, WeberWare version 1.0 is currently available from the AMSAT Software Exchange. Contact the Exchange at 301-589-6062 for further information.

NORTH EAST DIGITAL ASSOCIATION FILLING A NEED

The North East Digital Association (NEDA) was formed to support packet-radio networking in the Northeast. The association's main purpose is to maintain a reliable inter/intra-state packet network that is useful to Amateur Radio operators for emergencies, education and the fun of the hobby. Currently, NEDA's network extends throughout central New England and New York State.

NEDA is a member-supported organization. Members are those hams who feel that the cause of packet-radio networking is worth funding. The goals of

NEDA are to form and maintain a reliable and consistent long distance packet-radio network, to educate Amateur Radio operators as to effective methods of long distance packet-radio network construction and operation (NEDA creates and distributes documentation; their 20-page introduction package is an instruction manual for using the network), to provide equipment for sites required to implement redundancy in the major backbones, to provide a common ground for different organizations that are doing long-distance packet-radio networking in the hopes of sharing resources (to achieve NEDA's goal of redundancy with minimum wasted effort).

New NEDA members receive a 20-page information package which includes basics of networking, network maps, instruction manual, who to contact, what it takes to make a node and information on NEDA's node configuration policy. After each quarterly Board of Directors meeting, NEDA sends a copy of the quarterly letter to voting members, supporting members, and clubs that are members. The quarterly includes the latest maps, Treasurer's report, Board of Director's meeting minutes and articles.

NEDA members may send an SASE at any time for copies of the current maps. NEDA maintains eight maps: a user port map and backbone maps for each of NEDA's divisions (Finger Lakes, Hudson, Massachusetts and New Hampshire). NEDA is also committed to generating documents on subjects related to network design and management. These are announced in the quarterly when they are available.

For information on supporting NEDA, send an SASE to PO Box 563, Manchester, NH 03105-0563.

G8BPQ PCNODE VERSION 3.57 AVAILABLE

Version 3.57 of G8BPQ PCNode is now available and includes "multi-KISS," a protocol for operating multiple KISS TNCs on one serial port, improvements in the PK-232 host mode interface for AA4RE BB, an internal KISS interface for TCP/IP applications and several bug fixes. The software may be downloaded from CompuServe's HamNet as a self-extracting LHARC archived file called BPQ357.EXE.

MACINTOSH TCP/IP VERSION 2.0 READY

Version 2.0 of the Apple Macintosh TCP/IP software is now available with a number of enhancements, support for the new features found in the PC versions (including NOS) and bug fixes. The software may be downloaded via Internet using `anonymous ftp' from apple.com, in the directory `pub/ham-radio' or from the N6OYU landline BBS at 408-253-1309 (1200 to 9600 baud). You may also send a $5 donation to Doug Thom, N6OYU, (c/o Thetherless Access Ltd, 1405 Graywood Dr, San Jose, CA 95129-4778) to obtain a diskette containing the software.

C-64 TERMINAL PROGRAM FOR BLIND HAMS

Jerry Johnson, K0QQS, wrote Packet Reader Program, a packet- radio terminal program for his blind friend, John Bloom, K0GCY, that uses a Commodore C-64 computer and Votrax Vo-Talker voice synthesizer. The software causes the synthesizer to read each letter or word as it is typed and to read packets as they are received. Received packets are buffered so that they can be repeated as needed. The program also uses the C-64's disk storage capabilities. For information on how to obtain a copy of the program, send an SASE to John Bloom, K0GCY, 1312 North Union, Fergus Falls, MN 56537.

from John Bloom, K0GCY

CONNECTIONLESS MAIL PROTOCOL AND MORE

It seems to me that the main use of our network is for the transfer of items of general interest (bulletins), first, and personal mail, second. Now this may seem a bit strange particularly when one could put a reasonable case that there are more personal messages generated than bulletins (I do not go along with this, but am willing to be convinced). The trouble is that personal mail has an origin and one destination, bulletins have an origin by N destinations where N is at least every PBBS in the country!

The majority of traffic is the sending of bulletins to every PBBS, ie, over and over again. This leads people, who think in terms of telephone lines, to say we must rationalize, we must stratify, more channels, more bands, etc. Can you not see the beauty of one channel with many stations listening, in other words, use the broadcast nature of our medium. Why must we always think in terms of telephone lines? We are not on the telephone, we are not in a one-to-one, origin-to-destination situation. We can broadcast. Think about it.

Anyway, after a year or so saying I really must do something about it and writing the specification outlined below, I have also started writing a simple terminal program/conferencing system/PMS/PBBS (I haven't quite worked out what it will be yet). One of this program's features is that it listens to the channel and tries to generate messages out of the many copies of a bulletin that are sent. It turns out that it receives between 50 and 90% of all the messages that pass by it on any particular pass through depending on who is sending what to whom locally. This means that there are four local sub-PBBSs and also the original feeds to our local NTS station that I can get 95% or more of my bulletins directly from without actually being connected at any time.

I must say at this point that I don't necessarily believe that we need only one channel. Trunking should occur elsewhere, but I do believe that we should start thinking about what we are using, its nature and use the properties of our medium to the full. I also say that it may be that we could use far less equipment to achieve our goals if we do not go down the "professional's route." One could also ask what would be the point of emulating a known solution? I thought we were in this hobby to invent new

and better ways and means. Why else are we tolerated in the busiest and most commercially valuable portions of the spectrum?

What I have done so far, which is merely some fancy pattern matching on monitored BPQ data, is not perfect. It gets it right 99.98% of the time and, as such, is not suitable other than for a leaf PBBS or PMS system. I have designed a UI protocol which could give 100% data integrity while still retaining the flavor of the broadcasting mechanism. I outline it below.

. . . (Continued next page)

Part 3 of 7

CONNECTIONLESS MAIL PROTOCOL AND MORE - Continued

UI Frame Connectionless Mail Protocol Specification Version 1.00

The aim of this protocol is to utilize the broadcast nature of the radio medium to minimize the amount of air time it seems to take to distribute the mail. This system is not meant to replace all of the current system of connections from one mailbox to another, but to optimize the distribution in a local area within range of a powerful node or other powerful repeating transmitter.

This specification is based on earlier work of mine and G8UFQ (now, sadly, deceased).

The basis on which this protocol is devised is as follows:

1. Radio is a broadcast medium, a packet (particularly if it is sent by a powerful and/or well sited transmitter) can potentially be heard by a large number of receivers.

2. The nature of the TNC, FM radio and CSMA environment is such that if a station can be heard loudly, then all other stations will tend to shut up until a suitable pause appears, at which point, they all tend to jump in.

3. The loudest station usually controls the flow traffic in a given area, thus any other station that uses that loud station usually gets more traffic through more quickly than if they go direct while the loud station is transmitting.

4. If we sent UI framed packets via the loudest station, they will be heard by many people (witness all the complaints about long beacon texts via several repeaters). If those packets can be uniquely identified as part of a particular message and also which part, then a basis of a simple connectionless mail protocol exists that more fully uses the broadcast nature of radio as outlined in (1) above.

5. The concept of acknowledging each packet correctly received is, I believe, inappropriate for a congested FM CSMA channel such as the ones we are using. Research has shown (ZMODEM protocol) that it is more efficient to say what you have not received. Further, because we are

sending bulletins which are by their nature to be broadcasted, if the stations listening send their requests for the bits they missed, there will be overlaps such that any requests trampled on could be issued by another station anyway.

6. A bulletin is broadcast. This protocol is a means of broadcasting; the data therefore fits the protocol more nearly than the current method being employed. Individual mail probably fits the existing model quite well and would therefore continue to use the current system as would normal station-to-station conversation.

7. I believe it to be more efficient, overall, to send a complete message via a strong station and then wait for requests for retries of individual parts. In other words, to have a window size of infinity (or the size of the message). Further, because of the long delays between the TNC noticing a clear channel and the transmission actually being heard at full power, it will probably be necessary to send the first packet of a string twice or maybe three times because of the likelihood of its being trampled on by other stations [the main reason why the AX.25 fixed window size of >1 has been shown to be worse than simple window sizes of 1 (KA9Q)]. I propose to overcome this problem by using selective reject rather than the current system of `start again from the beginning even though I did in fact hear your last three of that window of four.' This will be used in the style of the ZMODEM protocol detailed in (5) above. Because we will probably be repeating, we will need to send packets at reasonable intervals (say 0.5 seconds) in order for the repeater to receive and onward transmit it, this parameter must be tunable to allow for local conditions.

Some Details

AX.25 allows up to seven packets to sent at a time in one gobbit of packets. Therefore, it will be necessary to send a gobbit of 1 to 7 packets, possibly with the first one repeated as it almost certainly will not be heard on a busy channel. Experiments will have to be conducted to find the optimum number of packets to send in a gobbit, taking into account direct broadcast or via a repeater.

Each packet should contain the following info:

o 1-byte Signature (suggest "~") to indicate to the software that this packet may be of interest

o 1-byte Flag to determine the type of packet.
M for mail
H for the mail header (from, to, subject, etc)
E for end of message
R for repeat request
A for I am active request (could cause mail to be sent to you)

o 14-byte BID. A standard bid, eg, 12345_GB7TLH, some unique message ID, all messages (even mail) has some implicit bid of this form, but it need not be like that above. Anything unique would do. Left justified, excess

padded with spaces.

o 5-byte Offset. The offset of this packet within this message. This is used differently in types H and E.

o 200-byte Data. This, of course, contains the data.

. . . (Continued next page)

QEX - The ARRL's Experimenters Exchange - GATEWAY Column - July 1990
Part 4 of 7

CONNECTIONLESS MAIL PROTOCOL AND MORE - Continued

Contents of Data Portion

H - It is suggested that this is of fairly standard form, ie, SB ALL @ GBR < G1TLH xxxxxxxxxxxxxxxxxxxxxxx where the offset in the header is the size of the message and xxxxxxx is the title. All portions contain the BID.

M - The actual data portion of the message split up into 200-byte chunks. The offset incrementing 200 bytes (or whatever) for each packet. The length of the message and, thus, that of the last packet is arbitrary.

E - Indicates end of message. It has the length of the message in the offset position. It may be useful to have a CRC16 checksum in hex (4 bytes) in the data portion (then again it is probably overkill).

R - Request for more data, in the form address/length. These are free format pairs (starting with the offset position as the first address), eg, 000128/200, 600/200, 1200/400. Each pair is separated by a comma and the last one is followed by a full stop (which could be left out).

A -This is sent by a THL style box when switched on to say here I am, anything interesting?

Addressing Issues

The unproto mail address needs some definition. In order to recognize a packet coming in as being relevant, it must pass certain tests.

1. It must be a UI frame.

2. It must contain the signature character `~' in the first byte of the information part of the frame.

3. The mail broadcasts need to be identified as such and so an unproto address of $$MAIL is suggested. Replies could contain this address for general work, but if a significant number of packets with a particular originating call sign are received, it is better to use an unproto address of that originating call sign such that only that station replies to requests for more data. This should go some way to preventing race conditions when two or more originating stations have the same BID and start replying.

The receiving station will need to be discriminating about who it uses to poll for requests and, if it gets packets from other stations with the required information, it must discard them, but possibly remember the call signs in case of failure with the original station.

. . . Continued next Page

CONNECTIONLESS MAIL PROTOCOL AND MORE - Continued

A Sample Conversation

GB7TLH>NP2>$$MAIL <UI C>:
~H12345_GB7VLS 01200SB ALL @ GBR < G9ABC FRED BOGGS IS LICENSED

No reply - wait say 5-7 seconds

GB7TLH>NP2>$$MAIL <UI C>:
~H12345_GB7VLS 01200SB ALL @ GBR < G9ABC FRED BOGGS IS LICENSED

No reply - wait say 5-7 seconds

GB7TLH>NP2>$$MAIL <UI C>:
~H12345_GB7VLS 01200SB ALL @ GBR < G9ABC FRED BOGGS IS LICENSED

This is repeated 3 to 5 times

G4RQN>GB7TLH <UI C>
~R12345_GB7VLS 00000/1200

This indicates that you wish the whole lot to be sent. This may be sent three times at one-second intervals, but could perhaps be sent up to 10 times as it constitutes `retries.'

I also may receive

GB7RWN>NP2>GB7TLH <UI C>:
~R12345_GB7VLS 00000/1200

and

GB7LDI>NP2>GB7TLH
~R12345_GB7VLS 00000/1200

So I send

GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00000xxxxxxxyyyyyyyy etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00200aaaabbbbbbccccccdddd etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00400eeeeeeeefffffffffggggg etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00600hhhhhhhhiiiiiiiijjjjjj etc etc
GB7TLH>NP2>$$MAIL <UI C>

```
~H12345_GB7VLS 00800kkkkkkkkllllllllmmmmmm etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 01000nnnnnnnnooooooppppppp etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 01200qqqqqqqqrrrrrrssssssss etc etc
GB7TLH>NP2>$$MAIL <UI C>
~E12345_GB7VLS 01200
```

I then might receive

```
G4RQN>GB7TLH <UI C>
~R12345_GB7VLS 00400/200,1000/200
GB7RWN>NP2>GB7TLH> <UI C>
~H12345_GB7VLS 00200/400
GB7LDI>NP2>GB7TLH <UI C>
~H12345_GB7VLS 00000/0,1000/200
```

This means that the need to resend packets 200, 400 and 100 and also 00000/0 is special. The station either has not heard the header or has woken up in the middle of this exchange and wants to catch up. 00000/0 will cause resending the header packet. It may be worth sending it at the start of an exchange in the first transmission of the message as a `noise' packet that causes the channel to be `grabbed' for this exchange.

So I send

```
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00000xxxxxxxxyyyyyyyy etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00200aaaabbbbbbccccccdddd etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00400eeeeeeeeffffffffggggg etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 01000nnnnnnnnooooooppppppp etc etc
GB7TLH>NP2>$$MAIL <UI C>
GB7TLH>NP2>$$MAIL <UI C>:
~H12345_GB7VLS 01200SB ALL @ GBR < G9ABC FRED BOGGS IS LICENSED
```

As you will note, these need not be in any particular order, thus, should be slotted in the appropriate place.

I may then receive

```
G4RQN>GB7TLH <UI C>
~R12345_GB7VLS 00400/200,1000/200
```

Because there is only one packet to be sent, I send it twice to make sure.

```
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00400eeeeeeeeffffffffggggg etc etc
GB7TLH>NP2>$$MAIL <UI C>
~H12345_GB7VLS 00400eeeeeeeeffffffffggggg etc etc
```

I now wait 5 to 7 seconds to see if there are any more. If not, I continue with the next one or shut up if there are no more.

Now there is a potential problem here in that I might receive a delayed request for a packet from the previous message. Two strategies might be used to cope with this. Either note the request and ignore it for the time being or keep the previous message file open and satisfy the request among the rest of the current message. If the first method is used, the current message is run out and the packet(s) from the previous message are then sent.

The reader will note that now three stations have obtained the six packet bulletin at a cost of 11 information packets from the originating station including retries. The actual level of retries is probably optimistic, but even on a dead, quiet channel, you would require 18 packets to be sent to do the same job without retries.

I think it likely that each originating station will have a list of people it is prepared to satisfy requests from to cope with lift conditions, but it may be possible to have a two-tier system in which a distant or unknown station can receive service, but only if a reasonable number of packets seem to be getting through, eg, locals may be allowed 10 retries but unknown stations only 3. After all, if conditions are that good they should be utilized.

This is preliminary, any comments, suggestions, etc would be gratefully received.

by Derek Koopman, G1TLH from Connect International via Hank Greeb, N8XX

QEX - The ARRL's Experimenters Exchange - GATEWAY Column - July 1990
Part 6 of 7

A NEW SERVICE, THE CALL SIGN SERVER

After I did a few keyboard-to-keyboard connections and PBBS log-ins, one of the problems I found with packet-radio communications was what else does it do for me. I can send mail to all those people out in packet-radio land that I do not know, and I can watch messages fly by that don't interest me. What was missing was a true user application. I thought, there has to be something we can do for the packet-radio community.

One afternoon, I was logged into Internet (a worldwide computer network) and saw a message that a group of people were putting a project together to acquire a copy of the Amateur Radio call-sign data base from the FCC. Great! I could put together a service whereby people could contact my packet-radio station and lookup a call sign. This could be an interesting service and, if successful, provide something useful to the community. Since I knew one of the people involved in getting the data, I contacted him and got a copy of the database.

As it turned out, the actual data file is 108 Mbytes in size and contains over 435,000 call signs. Unfortunately, it contains only US call signs, but that's a great start. In addition to the call sign, each record of the file

has the mailing and station addresses, the class of license, previous call sign, renewal/process/expiration dates, and even the persons birthdate! Now all I had to do was figure out how to provide access to this data from my packet-radio station, how to store this huge database file, and how to tell people about it.

I was working on another project, porting the KA9Q TCP/IP package to the Macintosh computer, when several people asked the same question, "What are we going to do with TCP/IP?" It is certainly a neat system, but without applications to use it, it suffered the same old problem. Then the light flashed! How about interfacing the call sign database to one of the TCP/IP servers... like the finger server?

The finger server is a utility built-in to the TCP/IP package that allows a remote station to query your station for basic information. "Great idea," said Dewayne Hendricks, WA8DZP, the programmer who did all the work, and in a few days he had written the initial code to access the call sign data file. It took several more weeks of debugging and testing, but finally we had an extension to the finger command. Below is an example of how this all works (bold character are typed by the user). [Bold characters indicated between *s.]

net> *finger %wa8dzp@n6oyu*
SYN sent
Established
[N6OYU]

Name: DEWAYNE L. HENDRICKS
License: WA8DZP
License Class: E
Mail address: 43730 VISTA DEL MAR, FREMONT, CA 94539-0000
Station address: 43730 VISTA DEL MAR, FREMONT, CA
Effective date: May. 17, 1988
Expiration date: May. 17, 1998
Previous Callsign:
Previous Class: A
Birthdate: Oct. 11, 1949
Process date: May. 17, 1988

Close wait
Last ACK
Closed (Normal)

Note the use of the %callsign@N6Oyu syntax in this command. The typical finger command looks like this:

net> *finger doug@N6Oyu*

This will look for a text file named "doug" on the system diskette and copy its contents to the TNC. With the call sign server extension, we added the *%* to tell the finger server to lookup the following call sign in the data base and return that information to the TNC.

As it turns out, TCP/IP allows the use of another command to query information provided with the finger command. This involves using the telnet ommand (telnet is the command used for keyboard-to-keyboard communications with another TCP/IP station). This gets fairly complicated, but suffice to say, it works. Below is another example of using the telnet command to get the same information.

```
net> *telnet n6oyu 79*
SYN sent
Established
[N6OYU.norcal.ampr.org]
*%ka9q*

Name: PHILIP R. KARN JR
License: KA9Q
License Class: E
Mail address: 25B HILLCREST RD, WARREN, NJ 07060-0000
Station address: 25B HILLCREST RD, WARREN, NJ
Effective date: Sep. 27, 1988
Expiration date: Sep. 27, 1998
Previous Callsign:
Previous Class:
Birthdate: Oct. 4, 1956
Process date: Sep. 27, 1986
Close wait
Last ACK
Closed (Normal)
```

In the above example, *79* tells the telnet server to forward the request to the finger server, which in this case is the *%ka9q* on the next line. The server processes the request as before.

. . . Continued Next Page

A NEW SERVICE, THE CALL SIGN SERVER - Continued

This was all fine, but what about all the rest of the packet-radio users that do not have the TCP/IP package up and running? Well, TCP/IP will support AX.25 connections and provides a mailbox function. So, Dewayne also wrote some code to extend the mailbox function to permit inquiries of the database. The addition of the inquire command to the mailbox code now provides AX.25 connections access to the database. Below is a sample of the process.

```
*Connect N6OYU*
Conn pending
Connected
*<carriage return>*
[NET-$]
Welcome to the N6OYU.norcal.ampr.org TCP/IP Mailbox
(C)hat (I)nquire (S)end (B)ye

Disconnected

Now all packet-radio users have access to the call sign server via several different mechanisms. Since bringing up the sever, there have been over 3500 accesses over a six-month period. The service proved especially useful during the last Field Day exercises with several hundred requests during the weekend. An additional observation is to see what each new user does with the server. First, almost without exception, everyone looks up their own call sign! Then they look up their friends.

What is all this running on? The database file is on a 300-Mbyte hard disk drive which is connected to a Macintosh Plus computer running Apple's AppleShare file-server software. The radio is a Yaesu FT-211RH connected to an AEA PK-232 TNC and another Macintosh Plus computer running the Macintosh version of the KA9Q TCP/IP package. The two computers are connected together via LocalTalk (Apple's networking system). My Macintosh II color system and a LaserWriter IINTX printer also share the network.

The future holds many changes for the service. The first will be a more current data file. Next, we plan on changing the method of access. As it stands currently, the only way to get call sign information is to directly connect to my station via either AX.25 or TCP/IP. What we plan on is similar to the White Pages lookup system that is available now in the PBBS network. You will be able to send a message to the system with whatever means you have and the system will send a reply message with the call sign information you requested. Now back to the coding.

One last note. You can connect to my station on the TCP/IP frequency of 145.75 MHz.

by Douglas Thom, N6OYU from NCPA Downlink

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail or or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem

on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each installment of Gateway is the tenth day of the month preceding the issue date of QEX.

4075. What is Phase Noise?

Newsgroup: rec.ham-radio
Date: 1990-07-09 05:49:05 UTC
From: mcmahan@netcom.UUCP
Message-ID: <11822@netcom.UUCP>
Source record: 10429

I have (at work) been exposed to phase noise in carriers. I understand the need to have a pure tone for something like a local oscillator, but the guys I work with make a big distinction between phase noise and FM modulation of a signal. To me, phase noise IS a form of FM modulation, since one can slightly change the signal frequency for an instant to shift phase. The stuff I see on a spectrum analyzer is definately different in appearance, though. I have asked them to expain it, but can't seem to make sense of the answer. Can someone please tell me why phase noise is NOT considered a form of FM modulation?

You might take a look at June 1989 Ham Radio Magazine, page 19.
I show a design for a 1010 MHz oscillator which has very low phase noise and can easily be phaselocked. Versions I have built can operate from 800-1200 MHz by only tuning the resonator. If you really want lots of tuning range (half octave+) make a quarter wave instead of a half wave resonator. Unlocked stability won't be as good (mechanical problem with unsupported line) but that shouldn't be a big deal if you phaselock it as I did.
The design center frequency was 1 GHz but things aren't changing very rapidly with frequency and you should have little difficulty making it run through 1500 MHz.
This is the reference I use for a harmonic mixer local oscillator. It's phase noise gets multiplied and transferred to the microwave local oscillators which I lock with it. The performance is good enough that even at 10 GHz the resulting spectrum is cleaner than my ICOM 701 was on 14 MHz. (Not everyone may agree that this is a positive testimonial (:>))
There is a picture of the resulting spectrum in the magazine series too.

Hope this helps.

>>I have asked them to expain it, but can't seem to make sense of the answer.
>>Can someone please tell me why phase noise is NOT considered a form of FM
>>modulation?

First, let me say that I'm no expert on the subject -- I've done a little
work with it, though.

Phase noise CAN be considered to be a form of FM modulation (or,
alternatively, Phase Modulation). Essentially, the phase of a CW signal is
varying over time. The reason that Phase Noise on a carrier looks
so radically different than narrowband FM (with two discrete sidebands)
is that the phase varies RANDOMLY with time. This random variaion
causes the characteristic "smearing" of the CW signal

To quantify this relationtionship:

S_delta_f(f)=Spectral Density of frequency fluctuations
(Frequency fluctuations^2/Hz)
=(Delta_f_rms(f))^2/B

where
B = Bandwidth

Delta f_rms(f)=Fourier Transform of (Delta_f(t))

Delta_f(t)=Frequency fluctuation of signal as a function of time
= (1/(2pi)) * d(Delta_phi(t))/dt

Delta_phi(t)=Phase fluctuation of signal as a function of time

S_delta_f(f) is directly releated to what you see on a spectrum analyzer.

There are four basic methods to measure the phase noise of a CW source:
1. Measure it directly with a spectrum analyzer
2. Mix the signal down to a lower frequency and use a counter
to measure the variance of the frequency.
3. Use a phase detector to measure the difference in phase
between your source and a reference source. The output of
the phase detector is displayed on a spectrum analyzer.
4. Use a frequency discriminator to demodulate the "FM" signal
and measure the output on a spectrum analyzer.

I hope this answers your question. Phase Noise is actually a very
interesting subject, once you dig into it. It's also one of those
subjects that are rarely discussed a standard E.E. curriculum.

>Gary KE4ZV

>>>>>>>>>>>>>>>

Many people seem to confuse "earth ground" with the "chassis ground" in
a piece of equipment. Recall that the term "voltage" is another name for
"potential difference." That is, voltage must always be measured WITH
RESPECT TO A REFERENCE POINT.

Here is where people get confused. Inside a piece of equipment, the chassis
ground is a common reference point for internal circuitry. The filters etc.
inside the box don't care whether the chassis is at "earth ground" or not,
they work the same in any case. External grounds (assuming they don't
affect antenna feedpoint impedance) don't affect the transmitter low-pass
filters at all.

Regarding the "shielded ground". Sounds like a quarter-wave decoupling
sleeve to me. At the quarter-wave resonant frequency, it will look like
an open circuit.

>How effective is a filter which includes a ground as part of the design,
>if you leave it UNGROUNDED?

It works just fine. I guess a lot of people are confused about this, so I'll expand further.

The transmitter generates RF voltage BETWEEN the center conductor of the output coax and the shield. Note that this voltage is NOT referred to earth ground. The chassis could be at 1,000,000 volts (AC or DC) with respect to earth, but there is still the same RF voltage existing between coax center conductor and shield -- the transmitter doesn't care.

If you have an external low-pass TVI filter, its internal circuitry is likewise referenced to CHASSIS ground (same as coax shield).

Part of the confusion is caused by using the same term "ground" to refer both to "earth ground" and the common connection point for circuitry within a piece of electronic equipment.

Yes, it is still on. I can get several of the beacons regularly here in Seattle, even when they are running 100 mw. There has been some packet QRM in the past few years, but it is still easily readable.

Maybe you have your dial set to exactly 14.1 MHz and the CW signals are not in your passband. Try tuning just below in the USB mode.

Many of you may have heard the DOVE satellite last evening when I turned it on two meters for the first time in three months. We are still having problems but we are getting much closer to the solution. I have some telemetry but I would like all you may have gotten. I would like packet received confirmation if you claim to have heard it. I need to see the telemetry. I can tell you from that which I have that the spacecraft appears in excellent condition. The three bus voltages are all nominal. The array voltage was nominal, the charging current was nominal and the output power was 2.5 watts (I was being conservative!). I am dumping (on S band) the DEATH_REASON byte (this will take many tries because of the S band modulator problem) from the kernel. I hope this will tell us the answer. The last word I have is that it was not heard on the next pass over the west coast. We will almost surely find the problem this week and fix it. DOVE ON AGAIN SOON.

Bob

I attended the "No Code" forum at the Indy hamfest this weekend. The turnout was very low, but this was probably due to the fact that the forum was not listed in the program, and the building indicated on a couple of signs was not on the map.

One of the people who argued against a no-code license indicated that he thought the reason it all started was so that the business interests could make more money.

If businesses keep folding and/or dropping from the ham market, where are we going to buy all our appliances?

The ARRL will have to take a LEADERSHIP position rather than a represent and follow position, if it is going to be able to keep amateur radio around.

Don't mislead yourself into thinking that the average ham is like those here on USENET. USENET and the other associated networks tend to be a filter of sorts. The proportion of technically oriented people here is much higher than in the amateur population as a whole.

The ARRL needs leaders. A leader needs to be able to resist even the majority if he believes his ideas are right. Of course that risks being voted out. But hopefully once some really good leadership starts happening at the League, then more people who feel the same way will join up.

We need an organization that considers the preservation of the VHF/UHF/SHF spectrum to be very important. It would be nice if the presently existing structure of the ARRL could do this, but whether or not this is the case, the need exists.

|> about how many MHz we have won or lost. Fractional frequency is all that
|> counts. [...]

I beg to differ. All of the frequencies mentioned except the 220 MHz
band are UHF. They are more similar to each other in propagation
and suitable uses than they are to HF, although I wouldn't say that
220 and 2300 MHz are completely interchangeable.

The point of the original posting was that the 220 MHz band is only
the tip of the iceberg in lost amateur allocations over the past
decade. It is only the shortsightedness of the existing amateur
population that has allowed these earlier losses to go essentially
unchallenged until the 220-222 grab.

>...
>Ah, but a series sometimes DOES provide more information,

Probably should not tell this story on myself, but here goes anyway:

Yesterday, while waiting for people to show up for our open house (yup, our house is up for sale), I decided to make use of the dead time and try to get one of my dead 2m radios working. To make a long story short, I thought I got one fixed, so took it out to the car, stuck a mag mount antenna on the roof, connected the radio to the antenna and tried it.

Nothing.

Ok, time to pull out the HT\amp\5/8 wave combo and stick it on the roof of the car and get both radios talking.

Hmm. Wonder why I cannot hear anything on my HT? Cannot raise ANY of the repeaters I know ("N7IKQ testing", what a pain! :-)) (nor any of the ones I don't know :-). Hmm. Well, anyway, after much fooling around, I happened to go into the house for something and, upon returning,, noticed that I had forgotten to put the ANTENNA on the mag mount... OOps...

Strange thing was, I could easily pick up packets down in the packet zone even without an antenna!

Still have problems with the radio, though. HT can pick it up more or less ok, but even tho its 25 watts I cannot key a repeater. I'm guessing that one of the 3 (!) LOs has some problem, since it hears NOTHING, even my HT with 10+ watts out and antennas 3 feet apart.

So, what does this have to do with kerchunking? Well, I can tell you I felt pretty stupid hitting repeaters with "N7IKQ testing". Kerchunking would have been a lot easier :-) :-) :-) :-) :-)

Also, I'd be interested in anyone's (semi-) educated guess as to what would cause the radio to: (1) send ok to a local (VERY local) radio, but not key up a repeater; (2) receive a dip meter set to (mostly) AM modulation when brought close to the antenna; and (3) respond to a VERY near field FM transmission by very slightly lowering the noise level coming out the speaker.

Any thoughts? ADVthanksANCE!!!!

Well, there was a repeater down in Tempe (AZ), located on a grain elevator,
which supposedly could give you a signal report if you 'asked it' to.
A friend of mine knew the owner of the repeater and knew all the codes to
send to get it to do all sorts of things. Unfortunately, there was something
wrong with it when he tried to give me a demo. (or he forgot the codes! :-)

John, do you know of which repeater I speak? I'm sorry I don't even remember
the freq it was on, its been a while (but I think 144 or 145).

(I don't suppose you could count such a contact during a contest?)

(On second thought, forget I even asked the question!) :-) :-)

>Dave Egan | Radio: N6XVZ

I also have a Kenwood TS140s and my understanding is that, if one is willing to spend the bucks, you don't have to design anything. Kenwood sells the IF-101 ($52) and the IF-232C ($100) that you need to do this.

Most amazingly Kenwood will not supply any software. And, by the way, feeling the full brunt that I didn't spend the extra $250 or so to get the TS440s over the TS140s, I haven't seen any software on the net for the TS140 - I have seen TS440s software.

BTW - Did I get "ripped off" with the 140 ? The 440 has a notch filter, triple conversion (vs double), selectable IFs, 100 memories (over 30) and 100% duty cycle with a cooling fan. Is it worth it. My after the fact opionion says that it probably would be. Oh well.

In any case, I too would like to know about any =>Mac<= (it seems most hams are blue) control software for the Kenwood TS140s.

Thanks,
Gary

I've been using a small nylon drawstring bag to carry my spare battery pack -- inside my daypack or backpack. So far it's worked great. Am I making a mistake?

The metal contacts on the outside of the FT411's battery packs seem to be dioded -- no voltage on them except when charging. Makes sense to me.

> 1) Does anyone have anything BAD to say about the 2SAT ???

I recently compared side by side and bought a Yaesu FT411. So I haven't used a 2SAT, but I can tell you what I didn't like about it, since you asked.

* Who needs a 180mAh built in NiCad battery? Sounds nice for emergencies, but then you realize you have to carry it anywhere you take the radio, keep it charged, replace it when it dies, ...

* The buttons seemed hard to push, and located too far from the display. Also they don't light up as nicely as an FT411 (though the latter's light only stays on while the switch is held).

* It was somewhat more expensive.

* I think it had fewer memories (not sure). It certainly lacked a couple of bells and whistles, but I forget which ones.

Now, it has somewhat more ergonomic controls in other ways, it has better sensitivity out of the ham bands, and I think it has a 12v jack for external power, all pluses.

I'll be interested in your comments after you buy one. :-)

Hey - I wasn't totally serious about getting 15 mhz of the HF bands. (then again, there is a God :-)). After I read that article about the demise of ham radio I almost barfed on my keyboard. It was so depressing and pessimistic I felt I had to post something upbeat.

BTW: I agree that we need more people getting involved in this hobby, but there is a flip side to the coin. Ever try to have a little fun on 20 mtr packet before ? It is a very frustrating experience. I believe that a major problem is dis-organisation and sheer ignorance of the people involved. You have alot, maybe hundredes of people all off by up to what, maybe 400 hz of each other - and total chaos is the result. It would not be a good idea to involve a whole s**tload of more new people into a mess like that. After using HF packet for a while, I wouldn't be surprised if the FCC banned packet radio from HF. It isn't very efficient is it ? Having said that, I am not impressed with operations on the VHF bands either. It leaves much to be desired. My point is that lack of a solid game plan and education is a major enemy to us, at least as far a digital communications goes. I joked to a freind the other nite that I think their should be 'regional SA's' for our packet radio network.

I also realize that there are other problems beyond the control of us operators, like not to great of a protocol, one hell of a lot of development all at once, etc - but I think the above is important.

I have donned the asbestos armor and am awaiting to hear replys from all you lovely people.....

Jeff - NR0D

NK6K Provides MICROSAT Bulletin Board System (BBS) Status Report

Harold Price (NK6K) this week has provided the AMSAT News Service (ANS) with a complete run down on the MICROSAT Bulletin Board System (BBS) software (S/W) development effort. Working in close collaboration with Harold is Jeff Ward (K8KA) at the University of Surry (UoS) on the UO-14 BBS S/W. The following is a brief synopsis of the current progress.

It was decided early on to use UO-14 as a testbed for all MICROSAT BBS development. NK6K points out that there are several advantages to this. First off, all S/W developed for UO-14 is completely portable to the MICROSATs due to a device programmers call high-level Application Programming Interfaces (API). The APIs hide the differences between the different computer architecture of the MICROSATs and UO-14. The APIs perform the "nitty-gritty" tasks that are peculiar to the hardware of a particular computer system. For example, one of the most common task performed by all computer systems is Input/Output (I/O) operations. Thus, to the programmer it makes little difference if the BBS S/W he is writing is for the MICROSATs or for the Packet Communication Experiment (PCE) on UO-14, as long as he uses the APIs.

Another advantage for using UO-14 as a testbed is the 9600 baud uplink/downlink that it uses. NK6K says that he can load new S/W in two passes as compared to eight passes for the MICROSATs. The MICROSATs use the much slower but more common 1200 baud. Also, UO-14 has a completely separate computer system for the PCE operations. The UO-14 On-board Computer (OBC) which controls the satellite is unaffected by what happens with the secondary PCE computer. So if the BBS S/W crashes, UO-14 will continue to operate normally. If the BBS S/W causes a crash of the OBC on a MICROSAT, a great deal of S/W needs to be reloaded. Although an OBC crash doesn't put a MICROSAT at great risk, it is inconvenient to the users. Except for DOVE, most S/W reloads of a MICROSAT OBC are not very difficult to accomplish.

MICROSAT STATUS, PT II

HR AMSAT NEWS SERVICE BULLETIN 188.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

MICROSAT Status, Part II

Lets go down the list of MICROSATs and give the present status for each one.

AO-16

AO-16 is in good shape. RAM memory tests will be done this week in preparation for uploading the BBS S/W. According to NK6K, at the present time, the BBS S/W for AO-16 is targeted to be installed and operational by August. Until that time digipeating operation will be possible.

DO-17

DOVE is still transmitting on S-Band only. Full recovery has been delayed due to an unexplained anomaly in the S-Band transmitter. N4HY has to rely on the S-Band transmitter because the 2M transmitter blocks the 2M receiver on DOVE. This anomaly has required N4HY to use his considerable programming skills to write special Digital Signal Processing (DSP) S/W to work around this problem. Another problem plaguing the DOVE recovery is that N4HY's hastily assembled S-band station is about 5 dB SNR lower than what is required for reliable reception. N4HY has, however, been able to use the high quality S-Band station of K0RZ in Boulder, Colorado via phone patch during mutually visible passes for software loading. N4HY has given the DOVE recovery top priority. At press time (Saturday July 7), DOVE had again crashed as evidenced by MBL transmissions from the S-Band beacon. Analysis was under way to determine whether the crash was due to a problem in one of the tricky software upload sessions or, less likely, another hardware problem. Two meter transmissions were not expected before Tuesday July 10.

MICROSAT STATUS, PART III

HR AMSAT NEWS SERVICE BULLETIN 188.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

MICROSAT Status, Part III

WO-18

WO-18 is in good shape. The third version of the imaging S/W was uploaded last week. The Weber State University (WSU) engineers have added more "tuning knobs" to the picture taking S/W in order to improve the contrast of the earth images. Additional information has been added to the image header giving the solar array currents and horizon sensor values when the picture was snapped. These added items will provide more information about where the lens was pointed when the picture was taken. The impact detector, which was originally designed to indicate when WO-18 was hit by micrometeorites, is being used to verify that the CCD camera iris shutter has clicked. When the shutter is snapped, the impact detector instantaneously sees the vibration that the shutter operations cause in the spacecraft structure.

Each day several images have been downloaded and those who have WeberWare 1.0 can turn the binary data into pictures on CRT screens. Finally, the 1.2 GHz

Fast Scan TV receiver was tested and the horizontal sync was detected. A full image is expected to require more gain and/or much more accurate antenna pointing.

One good quality picture of earth features has finally been taken and will be transmitted every evening for the next several days so that WeberWare 1.0 users will be sure to have a chance to capture it. Other testing will continue during each day.

LO-19

LO-19 is in good shape. The RF power output of LO-19 is though to have been varying because of the simultaneous operation of the CW beacon. Once the RAM memory checking S/W has been finished and checked out on AO-16, the same RAM memory check will be performed on LO-19. Eventually the AMSAT-LU Group will take over all the S/W development for LO-19 after the BBS S/W is installed.

At the present time all general housekeeping and monitoring tasks are performed by the AMSAT-LU team.

DOVE RECOVERY EFFORT INTENSE

HR AMSAT NEWS SERVICE BULLETIN 188.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

N4HY Tries The "Auditory" Method For Loading DOVE Software

This past weekend, N4HY was connected through a phone patch to the QTH of Bill McCaa (K0RZ) in order to take advantage of Bill's S-band station in an intense effort to bring DOVE back to life on two meters. In what amounts to an all-time packet radio first, N4HY will listen by ear for the Acknowledge packets to decide if he needs to resend each 128 byte packet. K0RZ provides the downlink station and N4HY uses his own 2M station to uplink S/W to DOVE. N4HY is using his own special bootloader to load 50,000 bytes of S/W instead of the resident ROM based MICROSAT Bootloader (MBL). This new DOVE bootloader will only send an ACK when it receives a good packet stream, but will never send NACKs. If N4HY therefore does not hear an ACK for a particular uplinked packet, he assumes that the packet wasn't received by DOVE and he manually sends it again. So far this "auditory" packet S/W loading technique has worked well.

Although many might view this as a futile effort, N4HY has chided himself for not thinking of this technique several months ago. As N4HY puts it: "WHAT A HACK, but no reason it shouldn't work!" The primary ingredient to making this happen, however, is the outstanding S-band station of K0RZ.

Stay tuned to AMSAT Nets and ANS bulletins for further updates on the recovery of DOVE-OSCAR-17.

AMSAT-DL STMNT ON AO13 ORBIT

HR AMSAT NEWS SERVICE BULLETIN 188.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

The following statement has been received from Dr. Karl Meinzer (DJ4ZC), President of AMSAT-DL:

"Recently some information has been circulated stipulating the decay of the AO-13 orbit between 1992 and 1997.

"Elliptic orbits with high inclination (like AO-13) are potentially unstable due to luni-solar perturbations. This has been known for a long time and in fact some Molnija-satellites have prematurely decayed from this mechanism. AMSAT was aware of this problem and had a study performed by a NASA expert in the late nineteen seventies for the P3 programme. The conclusion of the study was, that the perigee height can oscillate with an amplitude of +-1000 km. As a consequence the minimum perigee height for the P3-satellites was chosen to be 1500 km. On AO-13, 2500 km was chosen for additional margin against decay.

Recently, the problem of orbit stability was revisited by Victor Kudielka, OE1VKW (AMSAT-DL Journal 2, 90, pp. 5-7). OE1VKW discovered that the perturbations can have a longer "time-constant" and thus result in much larger effects than previously believed. In particular he predicted a possible decay of AO-13 for early 1997. At this time we do not understand the discrepancy between the old study and OE1VKW's results. Since OE1VKW's results so far are in good agreement with the actual orbit of AO-13, there is little doubt that his computations are basically correct. So the conclusion is inevitable that the old study was either too coarse or that the change of the lunar orbit (18.6 years nutation period, 8.6 years period of perigee rotation) has invalidated the original study.

SB ALL @ AMSAT $ANS-188.06
AMSAT-DL STATEMENT, PART 2

HR AMSAT NEWS SERVICE BULLETIN 188.06 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

The publication of OE1VKW's work triggered a flurry of activity in the USA. In particular Bob McGwier, N4HY, used a NORAD tracking program and found that a decay may happen as early as 1992. Bob states that he used the program as a black box without having user instructions. Unfortunately, the orbit situation is such that some very slight parameter changes have a dramatic influence on the lifetime. Also, numerical integration programmes have many potential pitfalls. So at this time, we can only conclude that the perigee height of AO-13 is coming down and this could lead to the loss of AO-13 during the nineties.

Also, at this time it is unclear in what direction the orbit will be influenced by the onset of air drag. It could either make the orbit more stable or accelerate the decay. Also it will be worthwhile to investigate if we have any means to prolong the life of AO-13 by exploiting the on-board systems.

With the orbit of AO-13, we apparently were very lucky and very unlucky at the same time. We were lucky in that we used to our propulsion excess to increase the perigee height over the original figure just to "buy margin" without a strong reason. But we were also unlucky because the present studies were not available in 1988. It would have been easy to either wait after the first motor-burn for a sufficient RAAN-change before the final burn thus eliminating the problem or to increase the perigee height even further. Certainly we will not be so blue-eyed with P3-D.

Of course, AMSAT-DL will make every effort to keep AO-13 in operation as long as possible. We hope that we can keep AO-13 until P3-D is launched to give us continuity of operation.

NEW AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 188.08 FROM AMSAT HQ
SILVER SPRING, MD JULY 7, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190
Mode-LS : MA 190 to MA 195 (Mode S Beacon only)
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 240
Off : MA 240 to MA 003
Omnis : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:

BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

I'm afraid that YOU are the one that is confused. When an unbalanced filter
is used to bypass unwanted RF energy to the chassis and the chassis is
not connected to ground, the chassis structure and the outside of the
coax shield, the microphone cord, the powerline, and any other wires
connected to the chassis become RADIATING ELEMENTS for that unwanted
RF. Thus the desired effect of preventing unwanted radiation is lost.
The currents between the coax center conductor and shield are supressed,
but that is of little use if the outside of the coax becomes "hot".

>filters at all.

Indeed, this is where people become confused! As you stated, the filter
will supress the unwanted frequency components travelling down the
inside of the coax between center and shield. However, the currents
that were bypassed to the chassis excite it exactly like a long wire
antenna is excited and you will see radiation from the chassis, the
outside of your coax, your mic cord and any other wires attached to
the transmitter. Believe me when I tell you that twenty five years
experience with broadcast high power transmitters, and the RF burns
from ungrounded chassis, has given me plenty of practical as well

as theoretical knowledge on this particular subject. :-)
>
>Regarding the "shielded ground". Sounds like a quarter-wave decoupling

This is true. That is why you must use more than one lead, each of a different length so that at least one will not be resonant at a given frequency.

Data point: In 1963 when I took the General Exam (the highest class license available for amateurs) the exam was on much simpler technology and was considerably easier than the FCC First Class commercial exam that I passed at the same time. I have recently examined the study guide for the amateur exam and note that the technology is considerably more complex and IMHO the exam itself is more comprehensive than the current FCC General commercial exam.

>
>Could someone explain how further easing the requirements is going to
>increase the technical quality of hams?
>
>AL N1AL

Times have indeed changed. People still crave electronic excitment, but ham radio, mired as it is in obsolescent operating technology, is no longer relevant to these people's needs. Many of those who would have been the "techie" hams of the 50's are the computer hobbyists of today. They don't see the current ham radio or it's exam structure as RELEVANT to their needs. A radical restructuring of amateur radio and it's exams is necessary to offer something to meet people's current needs. The only way to attract people to amateur radio or any other optional electronic recreational activity is to meet an emotional NEED they have for electronic excitment. Morse code does not meet that need for the vast majority of technically inclined people today anymore than 78rpm records meet the needs of audiophiles accustomed to compact discs.

>My 3 element 20 meter Yagi has a director and reflector that are each
>a continuous piece of aluminum tubing. How would a variable capacitor
>tune these elements?

A series capacitor, inductor, or both could be used to vary the phase
of the current in a parasitic element with respect to the driven element.

>To be effective, a Yagi requires precise spacing in terms of a fraction
>of a wavelength between each element. If I am using .18 wavelength
>spacing from the driven element to the director on 20, that becomes .36 wv
>on 10 meters.

Effective yagis can be designed with very close spacing or very wide
spacing. There is an optimum spacing for forward gain, and a different
optimum spacing for f/b ratio, but the things will work over quite
a wide range of spacings. Just look at some of the simpler tribanders
such as the TA33, which uses the same spacings for 10, 15, and 20.

> Also, my .507 wv driven element on 20 becomes over one
>wavelength long on 10, no matter how you tune it.
>
>I see problems!

The reason your 20 meter elements have these lengths is that it gives
the correct phase relationships between the currents in the 3 elements, and
it presents a good match to your 50 ohm cable. There are lots of ways
to vary phase of the currents and to match the driven element to 50 ohms,
even if the elements are much shorter or longer than 1/2 wavelength.

Subject: Antenna Farms?

Then there's always the VOA farm just north of Cincinnati...used to be the WLW antenna farm, as I recall (back when WLW was 500KW and came in stronger in Australia than the local AM BC stations!). I remember a QSO with a new Buckeye just moved in from Texas whose old buddies were heckling him about moving North. He drove up the interstate (I-75) to the VOA site and had a friend take a photo of him standing strategically in front of "his new antenna farm in Ohio." I bet he got quite a chuckle out of it...

I am using a small flourescent desk lamp in my study at home.
I recently replaced the tube.
Now when the light is on,
it generates so much RFI that I can no longer use the
AM broadcast band radio that is in the same room.
I tried still another tube with basically the same result.

Is there a way to reduce this RFI
(bypass caps, filter etc)?

During shortwave listening I just shut off the offending lamp,
but for other times I would like to use the lamp and
listen to the AM radio.
Can anyone help?

I briefly checked the ARRL handbook and didn't see anything helpful
for appliance generated RF noise.

Thanks for any help.

Does the command set inside these radios (TS-440, 140, icom, kenwood, etc.) allow you to poll the radio for its current frequency, or do they just let you transmit commands like "switch to memory 5" ? (More to the point: could your electronic logger automatically "grab" the frequency from the radio and store it in the computer). I have not seen the command set for any of these computer interfaces.

>my library covers HF and microwaves but has quite a hole in between.
>Suggestions are welcome.

You could try a Helical Resonator but to get the low insertion loss it
would have to be large.
Cavity filters are also useful in these applications (but they may end up
larger).

An excellent book on such matters is the RSGB VHF/UHF Manual by Jessop.
(Available through ARRL)
Another good book (bible) on filters (microwave) is "Microwave filters,
Impeadance-Matching Networks, and Coupling Structures" by Matthaei Young &
Jones. (available through Artech House.)

I am getting my self out on a limb with this but will go ahead anyway. If we define a pure signal to be only one infinitesimal line on a frequency spectrum then no modulation would exist. Anything different from that would be caused by modulation. The modulation would be a result of changing amplitude or frequency and a change in appearance of the infinitesimal line width or height. This could come through noise or some form of intentional modulation. Since frequency is the rate of change of phase, it seems a relationship does exist but would manifest itself in a different appearance.

> When was this? I must have missed it....

Well, he started BYTE magazine and advised hams to get started making
money in the upcoming (we're talking 1975 here) microcomputer revolution.
Apple Computer [your employer] seems to have done pretty well,
along those lines.

He also advised hams to cash in on the home security business....and sure
enough, a few did. Now it's a big and still growing market as crime
and threats to life/limb/property continue to escalate. Even AT&T [my employer]
is selling its own flavor of home security products....

That's two pretty good examples.

He sees that the hobby is dying (and yes, contrary to the professional
contesters and full-time hams out there, it IS a hobby for most of us);
he is not afraid to say unpopular things. If amateur radio went away
altogether, I wouldn't miss it.

As for myself, I'm a very inactive amateur radio operator. I keep my
license renewed and that's about it....
it meant a lot to my father (he died in January of this year)
so I'm sure I will keep renewing it.
There's simply no attraction
there to hold my interest in operating a station.
Just a bunch of rabblerousers, armchair lawyers and
frustrated police-wannabe's for the most part (rec.ham-radio is an interesting
microcosm of all this).
At least Wayne's editorials are entertaining,
and (God forbid) they DO make you think. More than you can say for QST
or the ARRL (which bears an amazing organizational resemblance to the IEEE).
Nope, I don't belong to either anymore.

>IF-101 ($52) and the IF-232C ($100) that you need to do this.

I recently added the serial interface to our club's TS-440. Cost us
all of $15 in parts. You need an 8251A USART chip, a CD4040 counter,
and optionally a MAX232 RS-232 to TTL converter. (All available from
JDR Microdevices, mail order) If you eliminate
the MAX232, you'd knock the cost down to about $7. All you need to
do is plug the 8251a and CD4040 into sockets on the 440's processor board.
The manual even mentions it, I believe. (not much design there)
This will bring the serial lines
to the rear connector, but at TTL level (0 and 5V), not RS-232 levels
(+/- 8V). However, most real RS-232 inputs will understand TTL voltages
just fine, as the switching threshold is slightly positive, I believe.
You can also drive TTL from RS-232 by using a couple of diodes and a
series resistor to clamp the voltage to 0 and +5.

By the way, I even stole the +5V from the TS-440. On the processor board
there is a place for a little jumper, which, when installed ties +5V to
the NC (unused) pin on the rear connector. Looks like that's what they
had in mind, but chickened out. (They didn't want you shorting it out)

>
>Most amazingly Kenwood will not supply any software.
Yup that $150 is a rip-off, all right! I haven't had a chance to write
anything yet either, but I ftp'd some BASIC code from hamster that does
some demo type stuff, and I also got a list of the commands from someone
there. If enough people are interested, I guess I could post the command
summary to the net.

You know, I bet the 140 understands the same commands (or a subset),
and requires the same hardware mods. What does the manual say?

>And, by the way,
>feeling the full brunt that I didn't spend the extra $250 or so to get

>triple conversion (vs double), selectable IFs, 100 memories (over 30)
>and 100% duty cycle with a cooling fan. Is it worth it. My after the
>fact opionion says that it probably would be. Oh well.

I dunno, but until a recent household emergency evaporated my surplus
funds, I was fantasizing about a new rig. I liked the '440, but $1200,
was a bit high for me, so I dug out the old QST review of the 140, (June '88)
I was somewhat disturbed that the reviewer mentioned a reciever blocking
problem several times in the review, concluding "If you're seting up a
station to use primarily for contesting, this may not be the rig you
are looking for". He said that a signal of S9+40 20 Khz away, would block
out an s9 signal on the tuned frequency. Hmmm, sounds like typical 20
meter conditions to me. If I ever get more dough, maybe a used TS-930...

Thanks for the reply Tad. To help maintain context, I have included
your quotations from my posting (preceded with >>) along with your
comments (preceded with >).

>> The plan is to put up a three element beam cut for 20 meters. At the
>> center of each beam element there will be a tuning unit with a
>> variable capacitor that can be controlled from the shack. By tuning
>> the elements it should be possible to achieve optimum operation (gain
>> or fb ratio, not both simultaneously) on any frequency on the band.
>
>My 3 element 20 meter Yagi has a director and reflector that are each
>a continuous piece of aluminum tubing. How would a variable capacitor
>tune these elements?

I was thinking of elements that are insulated at the center, for
example a wire beam, but you could certainly tune solid elements
without breaking them. The linear resonators used by Moxon (HF
Antennas for All Locations) would be one approach, a "delta" match
would be another.

>> If the tuning unit has sufficient range, it should be possible to
>> operate the beam on 20, 17, 15, 12, and 10M by retuning the elements
>> for proper resonance. The antenna would have increasing gain as
>> frequency is increased.
>
>To be effective, a Yagi requires precise spacing in terms of a fraction
>of a wavelength between each element. If I am using .18 wavelength
>spacing from the driven element to the director on 20, that becomes .36 wv
>on 10 meters.

Most multiband yagis have this same problem. A 0.1 wavelength spacing
on 20M is 0.2 wavelength spacing on 10M. Its a compromise. A look at
the charts for gain and front-to-back ratio versus element spacing (in
ARRL antenna book, or in the Yagi Design Handbook) reveals that good
gain and fbr can achieved for a wide range of element spacings. The
wider spacing (in terms of wavelengths) that you get at higher
frequencies (up to the point where excitation of the elements begins
to drop off) along with the increasing length of the elements gives
increased gain. There have been several articles over the years on
the use of extended elements in yagis for increased gain.

>> Also, my .507 wv driven element on 20 becomes over one
>>wavelength long on 10, no matter how you tune it.
>
>I see problems!

The magnitude and phase of the currents in the elements are the important factors affecting yagi performance not the length of the elements. If the driven element is matched to the feedline, and isn't so long that the pattern deviates from the familiar figure 8 of the dipole, a yagi will work regardless of the length of the driven element. Moxon describes yagi's that are fed with open wire line and matched with tuners back at the shack. There is a feedline for each element so that the elements may be resonated at the appropriate frequencies. Also, some german outfit sells a multi-band yagi that is trapless and uses the full element length on each band but with fixed tuning for each band.

>>
>> This brings up several implementation questions for further research.
>>
>> 1) What sort of tuning unit?
>
>A MAGIC one! :)

No magic required. Moxon's book as well as my own simulation with NEC shows that retuning yagi elements works. I'm looking for ways to implementing such retuning without requiring multiple resonant lines back to the shack.

>>
>> Any other ideas?
>
>How about just buying a commercial triband Yagi with traps? Or perhaps that
>Mosley model that works all the WARC bands in between? It should work a
>LOT better!

I don't want to buy an appliance antenna. Particularly one with traps that waste power and don't realize the full gain potential of the element length. Besides it wouldn't be as much fun.

Also, a yagi with fixed tuning has a high front-to-back ratio over only a small frequency range. Tunable elements would allow >30db front-to-back ratio across an entire band.

Again, thanks for the reply, Tad. I'm still hoping for greater response. Surely there are some RC modelers or servo gurus out there who can tell me how to control my remote tuners.

4114. Contents of the Digest

Newsgroup: rec.ham-radio
Date: 1990-07-10 19:05:51 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9007101906.AA18845@ucsd.edu>
Source record: 10470

Sorry about this going to the list itself, but there doesn't seem to be any other way. Mail sent to "info-hams-request@ucsd.edu" appears to be being read only by a "listserv" program, not by a human, so questions and comments elicit only a machine-generated response like a "help" message. Unfortunately, that response still contains no real live person's address to send this sort of thing to...

1) We on the mailing list side have been seeing more and more messages included in the Digest which have "null" in the header info, and no subjects. These tend to be fairly incomprehensible. Can this be fixed so we see meaningful items?

2) Could the Digest header be amended to include a moderator's personal address, if the "-request" address is going to be read by a machine? We need somewhere to send traffic like this note.

3) The standard "undigestify" process (at least the only one I know of, which is implemented here as part of the MMDF "msg" program) has a lot of problems with embedded rows of dashes inside messages. Those are the digest convention to separate individual postings. To those of you who send traffic to the list: please ensure that your ".signature" fields are not preceeded by a line of dashes. Don't use lines of dashes to separate chunks of your messages or postings. Use equal signs or asterisks or some other symbols instead. To the moderator: could the digestification program be adjusted to remove any embedded lines of dashes within postings *before* those postings are combined into a Digest?

Sorry to pester those of you on USENET about this, which is of no interest to you. (But it would help us over here if you noted the bit about lines of dashes...)

Regards, Will Martin

4115. Some CW procedure questions (reply is LONG)

Newsgroup: rec.ham-radio
Date: 1990-07-10 19:12:03 UTC
From: wayne_a._lightsey.RochXRC@XEROX.COM
Message-ID: <900710-121240-5799@Xerox>
Source record: 10471

Ronald H. Nicholson, Jr., Hewlett Packard, uucp: nicholso@hpda.HP.COM, Cupertino, CA, writes:"Hi. I've got some questions that maybe the net hams could answer, at least those with experience in CW. ... I hear lots of variation in the use of things like:BT vs. periods for punctuation, one or two BT's at a time, R R R vs. FB, R R R before or after the callsigns, 559 vs 55N for the 2nd RST report, differing amounts of abbreviations, BK vs. BK TU vs. callsigns DE callsign KN, when to use AR (I've only heard it used twice), leaving out one callsign and just send DE callsign, just ending with BK and no callsigns, SK before or after the closing callsign, the dit dit at the end of contacts."

Following are my opinions based upon practice regarding some of the variations you list:

"BT" is used for a break in the conversational flow . "II" is another abbreviation sometimes used for the same purpose. In traffic handling, the various elements of the message header, e.g. message number, "II", message precedence, "II", check (group count),"II", time, "II", etc. are seperated by the double-I sequence for clarity. After the address information in a mesage, there is a "BT" - seperating the heading/address from the text about to be sent. In voice traffic handling, the "BT" is sent as "break". After the text, another "BT" is sent (in military protocol signaling the end of the message, i.e. in lieu of "AR") seperating the text from the signature information (in ARRL NTS format).

More than one BT is a long pause. The operator needs much thinking time! It is used occasionally following one message and prior to sending the next one while an operator shuffled papers, etc. The "BT's were sent to maintain "control" of the frequency and to let the other operator know that you were still there - that atmospheric conditions had not destroyed your communications path. If you really needed some time, you send "AS" meaning stand-by. If several minutes were to elapse, like while you answered a land line telephone call, you would send "AS 5" meaning stand-by five minutes.

"R R R" is poor operating practice. One "R" is sufficient, "Solid Cpy" is more succinct, and "FB" or "OK" means you at least copied the general meaning of the transmission.

"RST 559" is the correct way to send a signal report. 55N has no defined meaning - it is absolute laziness to not send the character "9" in morse code. If the practice were uniform, your "RST 559" would become "RST FFN". The problem with this, of course is that you do not know if you received a 559, 549, or 449!

All I can say about abbreviations are that they are an apparent attempt to speed up communications. In non-standard abbreviations, at high Morse speeds (25 wpm and higher), you are doing word recognition, not character recognition; and abbreviations that are not universally known throw a glitch in the communication. Abbreviations are not good practive in International communications. Mst hv no pblms undrstndg wht is mnt by wl frmd abbrevs lk WX, TMP, HPE CUAGN SN, TKX (or the variation TNX), bng addr as DR by DX stns whs rigs run 1TT WTTS to varius ANT on CLDY DYS WID RAIN! An unclear abbreviation could be a technical violation, considered enciphering - which is prohibited! You pays your money and takes your chances!

"BK" stands for "BREAK" - a signal used in break-in operation. Its intended purpose was to interrupt a message to obtain a fill or correct an error - rather than wait until the entire message had been sent. It is correct to use in traffic handling situations and O.K. if properly used in a normal QSO to interject a comment or thought in a conversational mode contact (most enjoyable to work someone who can do so!). Using this protocol, you are required to identify at the beginning , end and once each 10-minute operating period.

"BK TU is redundant, like "very best 73's - very best best regards's???". "BTU", sometime with a "K", meaning (I think), "back to you" seems to becoming a means of saying "Over" in CW.

"Callsign DE Callsign" " K" or "KN" ("K" means you are willing to have someone "BK"-in, "KN" means no "BK"-in allowed) is still used but was moderated by a rule change several years ago that no longer required station call transmission at the beginning and end of each transmission but only at the beginning and end of a series of transmissions with identification once each 10-minutes during the series of transmissions.

"AR" means "end of message". It is normally used at the completion of transmitting a formal message with header, text, signature, etc. Noah built and sailed an "AR K" but the useage in ham radio casual communications is incorrect and indicative of a LID operator! The only correct ueage of "AR" in ham radio is in conjunction with traffic handling but, like other special signals, is often abused.

"DE Callsign" is an extended break-in process except when fulfilling the 10-minute identification rule. You are not required to send the other stations callsign EXCEPT at the beginning and end of a series of transmissions.

"SK", In traffic handling parlance means you have sent the last of a series of messages and have no other traffic to send. (You never send "AR""SK"). If you expect a reply, you may also send "K" or "KN". If you do not expect a reply (i.e. the other station has already sent "SK" or did not list traffic for you ,"QRU"), then send nothing else! In commercial traffic handling, the "reply" would be message traffic from the other station to you - of which you were previously advised. By sending "SK Callsign DE Callsign K", you would be saying: I have sent the last of my messages for you and am now ready to receive your message(s) for me". The

useage of "SK" in ham conversation mode really has no defined meaning.

The "shave and a haircut - two bits" ditting sequence is silly and exists on the ham bands only to my knowledge! In commercial communications, it would mark you as LID - read "unprofessional" and possibly lead to your early retirement if other changes had not already provided that opportunity.

CW QSO transcripts should be personal - not scripted. Your initial exchange should include signal report, location and name - in that order. Those three items are the most important, in order, in checking rig operation, validating a contact etc. On the next exchange, I usually include rig description with antenna, etc. Weather is optional as is age, occupation, employer, unique geographical features (live on lake, by seashore, on mountain top, in Death Valley, etc.) or whatever else may come to mind if the contact seems like one you would like to extend. Remember, many foreign hams cannot engage in contacts beyond technical exchanges - although I would believe that those restrictions are relaxing now. Like any conversation with a stranger, toss out a little bait and see where it leads. If nowhere, say 73 and move on. 73 Wayne KB6CSP

]No. I don't think of ham radio as an antique wireless museum, which is
]basically what happens on HF. I think of ham radio as a National Park of the
]Mind where the curious can go adventuring on the frontiers of technology. THAT
]is happening on VHF and up.

Ah... don't get too down on HF. There are plenty of technical challenges
left on HF. For example:
(1) continued research on propagation;
(2) how to do packet radio EFFECTIVELY given the problems of HF
propagation, bandwidth and the inevitable hidden terminal problem;
(3) antenna work (antennae are a LOT more predictable at VHF
because they don't interact with funky grounds as much);
(4) noise reduction/cancellation techniques.

I don't think that the future of amateur radio is just on VHF and up!
HF has unique problems, and it also has unique capabilities. Don't
neglect it just because a lot of old farts hang out there and
chew the rag.

Ron,

I operated in California for several years with a Hustler 6BTV. Operation was satisfactory when ground mounted, better when roof mounted with radials.

I would recommend the Butternut all band vertical. Consistently, in my experience, Butternut verticals exhibited superior signals vertical to vertical or vertical to horizontal polarization. This may only be characteristic of the Butternut design versus Hustler et al loaded trap design, but I am convinced that they work better and if I were to buy another vertical, it would be the Butternut.

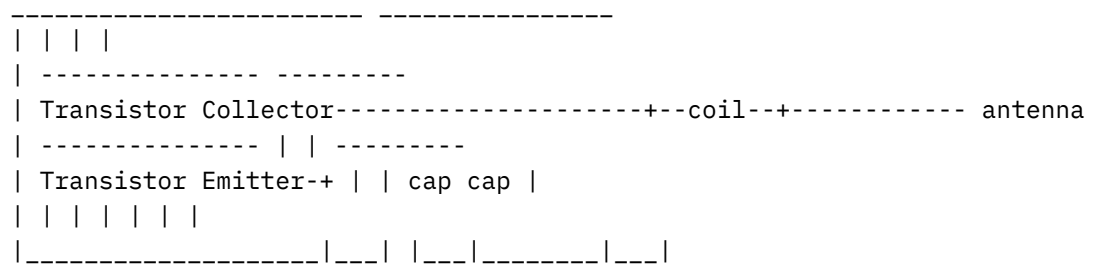
>but that is of little use if the outside of the coax becomes "hot".

>Gary KE4ZV

OK, I'll try to explain it one more time. Perhaps a picture will help.

TRANSMITTER COAX L. P. FILTER COAX



Please excuse the crude schematic.

The transmitter generates an RF potential between the coax center conductor and "ground" (= chasses = coax shield). I have omitted the tranmitter output coupling network for clarity, but the same principle holds -- both input and output of the network are referenced to chassis "ground".

The rf current going out the tranmsitter coax center conductor is matched by an equal and opposite return current flowing in the shield. Because of skin effect, this return current flows on the inside of the shield -- no current flows on the outside of the coax. In other words, there is no "common mode" current on the coax; it is all "differential mode" which means the two equal and opposite currents cancel and there is no radiation from the feedline.

The filter acts the same way. To see this, you can ignore what is inside the unit and consider it a "black box". Kirchoff's law says that current is not created or destroyed in a circuit. If the two currents (center conductor and shield) entering on the left sum to zero (equal and opposite), then the same must be true of the currents in the center/shield of the coax exiting to the right.

Note that the drawing above does not show an earth ground. All voltages inside the transmitter and filter are WITH RESPECT TO CHASSIS GROUND, NOT EARTH GROUND. You could connect a 1000 volt battery between chassis and earth without affecting circuit operation. Or a 1000V RF source.

Even though the low-pass filter circuit is referenced to "ground", this does not imply "earth ground".

I think that the people arguing about low-pass filters and the need for a good ground on the rig's chassis, and the OUTSIDE of the box being hot for RF even with a filter... ought to look into the idea of a Faraday cage. Also look at the TVI prevention articles written years ago in QST, Handbook,\ etc., etc.

Rusty Carruth brought up an interesting point when he mentioned that he thought he had problems with his receiver. Funny thing about transceivers: The transmitter only may fail, and vice versa. When working with repeaters and offsets, how do you know, when you fail to hear the repeater respond, whether it is because the transmitter isn't mitting or the receiver isn't ceiving? With a dead receiver, you could be banging the heck out of the repeater and never know it, all the while thinking you weren't "getting out".

Or the receiver could be mistuned. Or you could have the wrong split.

In my flying days, this used to be a concern, especially in IFR conditions. You reported to air traffic control but didn't hear a response. Was it the transmitter or the receiver? But in that case, there was a live person on the other end who would sooner or later call you and, hearing no response, assume your radio failed; or hearing your call but getting no response to his reply, would pretty well know your receiver was out. Still, you wouldn't know. With repeaters and kerchunks, a casual listener or a monitor wouldn't know who was trying to call unless an ID was given. Assuming the kerchunker giving an ID was in the book and reachable by phone, a monitor could at least tell him (her) that the transmitter was working.

On the receiver problem: I'd check the receive crystals (if there are any in the set). I'd make sure that the receiver is on the proper freq. If that passed, I'd try to do an alignment. Check any switch contacts and socket contacts to make sure all is OK. Use a wattmeter or another receiver to verify that the transmitter is working, not a repeater.

The beacon set is very much still in operation. The only serious problem we've had with it was when the unit at Stanford was stolen. I think it's been replaced now, but am not sure. If you have a decent antenna, the propagation is there, and the packet guys will leave the frequency alone, you will hear them. But you do need an accurate clock to know which of the beacons is going off in order to be sure you have your antenna pointed at it at the right time. The TS-140S has pleanty of sensitivity to pick up these signals, but I'm not so sure about your antenna. In the first place, there's no way you can position a dipole so you are pointed at all of the beacons without rotating the dipole--and I kind of doubt you are using a rotatable dipole, since you said it was a multiband antenna. In the second place, I'm a little skeptical of multiband antennas in general. Traps have loss. Period. What you've gained in flexibility you've sacrificed in performance. If you're going to string wire up, put up a different wire for each band. And by the way, I've found that a half-wave loop with a quarter wavelength matching section of 70 ohm coax will way outperform a dipole and be more broadbanded to boot.

If you're looking for more beacons, look in the callbook--there's a long list of 10 meter beacons in the front of one of the two (the international book?).

Also, somebody will periodically post a current list here on the net.

Now that you know at least some of what NCDXF does, why not learn more? I think you'ld be amazed at the list of expeditions NCDXF has supported. It was started by a single grant which has been well-invested over the years, but the real support for NCDXF comes from DXers like you and me. We ask people to contribute whatever they feel like. It's really amazing how much a very large number of only $10 and $20 checks can support. Do you have South Sandwich or South Georgia yet? I bet you don't--but after November you will, courtesy of NCDXF. Do yourself and other DXers a favor--drop a line to W6OAT and ask how you can help.

>I joked to a freind the other nite that I think their should be
>'regional SA's' for our packet radio network.

Agreed, 100%. Now, we need some really bright guy who is also a
polititian (yecho!) to sell this idea to the anarchistic masses. :-(

>I also realize that there are other problems beyond the control of us
>operators, like not to great of a protocol ...

Agreed. Nobody uses broadcasting like a previous poster suggested.
Throughput could probably be increased by using a token system, where an
individual station was prohibited from transmitting until the token was
obtained. In addition, I would like to see a LAN system where each
individual ham had (a minimum of) his own dedicated 1200 bit/sec
channel. I envision a system a little like the NTS where the net
control station tells people with traffic to go to a specific frequency;
of course this requires computer control of radios, but think of the
possible throughput! Local stations could communicate without any
interference! With synchronized clocks (and that's not too hard with
WWV) it would be possible to have stations listen for any bulletins on
some specific frequency at some regular interval. There are thousands
of other good ideas out there. Why aren't any of them in use by the
masses?

Two final ideas/points:

1 I have said in the past that packet just doesn't have enough
performance to hold my interest. This is still true.

2 Maybe we need a really tough theory exam for the new no-code
license. Topics covered should include computer networking (including
the OSI 7 layer model), structured software development methods, data
structures, at least one high-level programming language (not BASIC) and
assembly language, digital signal processing with all the math (Fourier
transforms, Hilbert transforms, Z-transforms, IIR & FIR filters, etc.),
communication theory, etc. as a minimum. In short we want to attract
the people who are EE and CS majors, and we want to encourage those who
aren't to learn this material so they can apply it to amateur radio.

The no-code folks (to my knowledge) don't object to a stringent theory
exam. As a matter of fact, a common statement is "Why I'm so
technically advanced that I can't be bothered with learning the code
since I don't think I ever want to use something so primitive." Well,
lets give these people a good tough (but fair) exam. This may also have
the effect we desire of attracting more experimenters and less appliance

operators. I have changed my mind about no-code, and now am willing to accept it, provided that a very comprehensive theory exam is required. The current theory exams, all the way through extra, are a joke.

Look in a very old handbook. 1960's or early 1970's should do. Look in the section on mobile rigs. The ideas are the same, but you want just 120V instead of ~800V. 400 Hz will probably work OK. Just use your existing PC power supply.

Some mic's, especially in the commercial world, have a wire connected to the hanger or button (I have a Wilson and its called 'hangup'). This is or can be used to inhibit transmit, or turn on some PL arrangement so while the person is NOT holding (i.e on the hanger bracket) the receiver will be silent. This is kind of strange for a 440 setup though, and normally this would be an input (could be pulled high in the radio) and grounded for activation of the circuit. As far as being burned by either voltage or rf, did you happen to be making a good ground contact with your body, via sweaty palms (from the dx you were doing) and steel toed shoes?? or something along that line.

4126. Motorola 77-satellite cellular plan

Newsgroup: rec.ham-radio
Date: 1990-07-10 22:33:53 UTC
From: mbutts@mentor.com
Message-ID: <1990Jul10.223353.1551@mentor.com>
Source record: 10382

EE Times of 6/25/90 and the popular press in general has reported that Motorola is planning to invest billions of $$ to launch and maintain a network of 77 microsats that will offer cellular service to remote areas in the US and foreign countries that are currently unreachable by terrestrial systems.

Motorola has reportedly proposed an L-band (1-2 GHz) spread-spectrum digital system that it hopes will become a standard for a new generation of portable cellular phones and data terminals. The writer observes that using satellites will greatly reduce reliance on ground-based equipment, and will make it easier to bypass regulatory and tower-construction barriers.

I'm surprised I haven't seen anything about this on the net. Does anyone have more solid technical information on this system? It seems that the success of AMSAT and others with microsats is having some effect.

I'm very excited at the prospect of the old dream of global satellite phones becoming a commercial reality. I'm also very pleased that a US company, for a change, has the foresight and apparently the will to go forward with such a long-range and expensive (but ultimately very profitable) plan.

Thinking in the long term, once such a system is in place and mature, would somebody care to speculate what the role of ham radio will be in a world where anyone can call to anyplace from anyplace anytime with a cheap portable phone?

4127. Half baked satellite idea

Newsgroup: rec.ham-radio
Date: 1990-07-10 22:39:34 UTC
From: rick@ameristar.uucp
Message-ID: <1990Jul10.223934.1550@ameristar>
Source record: 10383

On NPR this evening it was mentioned that there may be a joint
USSR-US satellite launch facility built in Australia. The idea
is to use Soviet rockets to launch US (& presumably other) satellites.
What does this have to do with Amateur Radio? Well, it was mentioned
that the first two launches will be with "dummy" payloads. Which
sets the mind to wondering whether an amateur radio satellite could
take advantage of the free ride (& potentially be larger than usual
since the ride is for testing anyways). Have the amateur radio satellite
types started pursuing this angle? Enquiring minds want to know ;-)

ARRL LETTER Volume 9, Number 13, June 29, 1990 - Part 1 of 4

NEW NOVICE EXAM FOR SOUTH AFRICA TO INCLUDE CODE

South Africa soon will institute a Novice license, following closely on the heels of a similar new license in Great Britain. Details of the new Novice, or Class B, license, were published in the June 22 edition of the Government Gazette.

Applicants must be at least 12 years of age, and will be required to pass a 5 wpm Morse code exam administered by the South African Radio League. After passing the CW test, candidates will take a written exam in operating procedure and "knowledge of the ITU phonetic alphabet."

According to Hans van de Groenendaal, ZS6AKV, president of AMSAT S.A., the SARL has been working behind the scenes for several years and "has based their proposal to the South African authorities on the proposed UK Novice license."

"The introduction of the Novice license," says van de Groenendaal, "will stimulate the growth of Amateur Radio in South Africa and will serve as a model for other countries in Southern Africa. Industry sees the introduction as a move to involve more young people in communications and electronics."

The new Novices, who will receive ZU1 call signs, will be allowed 5 watts DC input (or 20 watts PEP output), and will be able to use phone, CW and data on 160 meters; CW and data on 80 and 15 meters; and CW, data, and phone on 10 meters and 70 cm.

SARL is preparing to begin giving code tests, and the first technical examinations will be held in November.

NEW USER FEES TO SUPPORT DXCC

The ARRL DX Century Club will institute a new fee schedule Oct. 1. DXCC, while affecting a relatively small percentage of its members, is a substantial financial burden on the League. User fees, approved by the League's board of directors, will go toward better service (quicker turnaround time).

The fee structure is intended to encourage participants to send less frequent individual submissions to DXCC. Here is the basic outline:

1) After Oct. 1, every first-time applicant for DXCC will be charged $10.00, in addition to the usual charge for return postage. DXCC members as of Oct. 1, 1990 are exempt from this registration fee.

2) ARRL and CRRL members will be allowed free of charge one submission per calendar year; this annual submission may include any number of QSLs, any number of DXCC awards, and any combination of new and endorsement applications. It does not include a person's all-time first submission.

3) Non-League members outside the US and Canada will be charged $10.00 for their first DXCC submission of any kind each calendar year.

4) US and Canadian DXCC participants who submit more than once in a calendar year will be charged $10.00 for each submission after the first one. Foreign non-members will be charged $20.00 for their additional submissions.

ARRL LETTER Volume 9, Number 13, June 29, 1990 - Part 2 of 4

NEW TEST PROCEDURES FOR DISABLED

People suffering certain disabilities will get a break on Morse code requirements, FCC announced June 15 at the sixth annual meeting of Volunteer Examiner Coordinators.

The new procedures will allow volunteer examiners more flexibility in administering exams to handicapped or disabled people.

Given a physician's statement attesting to the handicap or disability, examiners may be able to substitute a Morse sending test for one in receiving, to allow spoken instead of written copy, and to use a Morse code recognition exam. More details on this will be forthcoming.

On other matters, the VEC Question Pool Committee, chaired by Ray Adams, N4BAQ, recommended continuation of all current questions, pending outcome of proposals to change the licensing structure (namely, the FCC's Communicator Class proposal).

FCC personnel listened to comments on the proposed Communicator Class license from the Communicator Recommendations Committee, as well as a summary of the League's "Strawman" position (see July *QST*, p 54).

The CRC also recommended that the 6- and 2-meter bands be included as privileges for the Communicator since "main- streaming" these new amateurs is one of the many goals of the new proposed license class. Also recommended was that all Novice examining be brought under the auspices of the VEC program.

The subject of fraudulent applications was discussed with no consensus reached on the extent of the problem (if indeed a problem exists).

Tom Ingram, K4OOV, of the Central Alabama VEC, was voted Chairman of the Conference for the next year.

The meeting, held in Gettysburg, PA, was attended by 12 of the 18 VECs, seven FCC staff members, Harry Dannals, W2HD (representing QCWA), two ARRL directors (W3ABC and N4MM), Evelyn Garrison, WS7A (of ICOM, representing

manufacturers), and observers from the Military Affiliate Radio System (MARS).

PROGRESS FOR INJURED SOVIET HAM

A 25-year-old Soviet amateur is making progress following injuries sustained in an automobile accident, thanks to the assistance of radio amateurs both here and abroad.

As reported last issue, Oleg Porugov, UA4FAY, was in a coma following the May 25 accident, and it has not been possible to move him from a hospital in Ryazan to better facilities. Through the efforts of several American hams, three shipments of supplies have been sent to Ryazan. An additional shipment of intravenous feeding solution has been sent by West German amateurs.

Medical consultation between Dr. Joseph Izzo, of Foster City, CA, Dr. Lawrence M. Probes, ND8S, and Dr. Charles L. Starke, NX2T, and Soviet physicians continues by both Amateur Radio and Telex messages.

A month after the accident, Porugov's condition continues to improve and the doctors are guardedly optimistic. Porugov is able to see and recognize friends, his partial paralysis appears to be abating, and he now is breathing entirely on his own.

RADIOSPORT EVENT RECEIVES GRANT

The World Radiosport Team Championship (see May *QST*, p 48) has received a check for more than seven thousand dollars from the ARRL Mullan Fund, the balance of a grant from the T. Mullan Foundation established to enhance goodwill between the peoples of the US and the Soviet Union.

Final arrangements for operating permission for visiting amateurs from the Soviet Union and several eastern European countries are being hammered out at this time.

Amateur Radio press kits for the WRTC, as announced in May *QST*, are ready for mailing; send an SASE for yours.

TEXAS HAMS WIN TOWER RIGHTS

Amateurs in Bedford, TX won a major tower victory earlier this month. On June 12 the city council of this Dallas-Ft. Worth suburb unanimously approved a 65-foot tower ordinance. A dispute which had begun in October, 1989 over the 60-foot tower of Mike Simpson, WB5SUF, had escalated to include virtually every amateur in the city.

The Simpson case, according to ARRL volunteer counsel Lanny Priddy, K5LP, was not a PRB-1 case, because it concerned plat and deed restrictions, not a local ordinance. Priddy did, however, cite PRB-1 in his arguments.

Ironically, Simpson praised the homeowners who had complained to the city. "They allowed the city to clear up the entire antenna question," Simpson said, because "before the ordinance hams had been given a plethora of conflicting information at city hall."

ARRL LETTER Volume 9, Number 13, June 29, 1990 - Part 3 of 4

IARU MEMBERS TO VOTE ON BURMA

Member societies of the International Amateur Radio Union are being asked to vote on the possible termination of membership of the Burma Amateur Radio Transmitting Society (BARTS). IARU Calendar 149, sent to all IARU societies June 12, notes that Proposal 195 was directed by the IARU Administrative Council at its April meeting in Spain.

Amateur Radio was officially banned by the Burmese government on January 10, 1964. It now is believed that "there is no one presently alive and living in Burma who has any connection with BARTS." The last communication from BARTS to the IARU occurred in 1976, from Zaw Yee, ex-XZ2SY, indicating that the society was inactive. Zaw Yee died the following year.

Votes are due no later than Nov. 12, 1990.

DISASTER RESPONSE DISCUSSED

A meeting of League and emergency response volunteers met June 12 sought to cement emergency planning through the National Disaster Medical Service. The Service, formed in 1983, would be called into operation in the event of a catastrophe beyond even the ability of an entire state or region to handle, only upon a state's request.

Communications still is a sticking point of the plan. While the National Communications System (NCS) is the major player, holding government communications assets such as leased and government-owned telephone lines, microwave systems, satellites and HF radios, the government agencies using these services necessarily will put their own needs first. It is impossible to determine in advance how much excess capacity will be available for medical evacuation and related purposes.

The lead agency for communications is the Federal Emergency Management Agency. FEMA's main mission is to coordinate federal response to disasters. Its plans for handling NDMS messages are unclear.

While all NDMS members at the meeting agreed that amateurs will be a part of any response to a major disaster, the League has expressed its concern that amateurs will be thrust into a de facto *primary* role. Since amateurs would already have been mobilized at the local level, their numbers and resources would likely be strained by a "national call-up."

Further discussion addressed amateurs' assignments and roles, as well as the establishment of message formats and protocols. A drill planned for October likely will include the ARRL in some yet-to-be-determined capacity.

Ultimately, the ARRL Board of Directors will decide whether to approve a formal Memorandum of Understanding between the NDMS and the ARRL.

Further talks are scheduled for July 12 in Washington.

FIELD DAY

Conditions were--to put it gently--rotten. But they tested our mettle as communicators, and that's what ARRL Field Day is all about.

Novices in particular, lulled by superb 10 meter conditions the past couple of years, may have been shocked by the white noise on that band over the June 23-24 weekend. They were treated to a taste of what's to come when the sun quiets down in another year or two.

Alternate modes of communication, particularly VHF packet and satellites, were kept especially busy this FD. Messages appeared on various packet clusters from FD stations in the field, and activity on AMSAT as well as Soviet and Japanese satellites was healthier than ever.

W1AW made a couple thousand FD contacts, in the process shaking down both new aerials and equipment at the visitors' operating positions. Six operators used computers for logging at four operating positions, running prototype FD software developed by ARRL contest assistant Mark Burke, KA1MIS.

ARRL LETTER Volume 9, Number 13, June 29, 1990 - Part 4 of 4

BRIEFS

* Corrections: Gay Milius, W4UG, who died June 6, was not ARRL Hudson Division Vice Director in 1951 and 1952.

The name of Allen Singer, N2KW, was misspelled in Volume 9, Number 12.

* FCC recently adopted an order implementing the license fees for most radio services other than amateur which had been established by Congress in the Budget Reconciliation Act of 1989. An unclearly drafted item in that order relating to duplicate licenses has been misinterpreted, leading many amateurs to believe that a 35-dollar fee is required for duplicate amateur licenses. This is not true--FCC collects no fees for any amateur license transactions.

* Congratulations to Leon A. Faber, W7EH, of Phoenix, and A.G. Wentzel, W2HX, of Trenton, NJ, both of whom recently marked seventy years as League members.

* The new target launch date for Shuttle STS-35 (and SAREX) is August 12 at 0506 UTC.

* Amateurs needing Kenwood parts now can phone toll free 800-637-0388 to place orders at the Kenwood USA facility in Long Beach, CA.

* On June 11 the Shelby (TN) County Commission unanimously approved an amendment allowing Amateur Radio towers up to a height of 65 ft., according to Atty. Albert C. Burnham, W4RIM. Previously, the Memphis City Council and the Land Use Control Board had approved the amendment. Completion of the process now has raised the allowable height from 35 to 65 feet.

* Nathan Gidron, general manager of Motorola Israel, has announced Motorola's "adoption" of the Israel Amateur Radio Club. Operating for years without a home, the club began a fund drive a few years ago that fell short.

Thus, Motorola will be allocating a room of 40 square meters for use as the offices of IARC, which is Israel's national society. (From *HaGal*, 4X1MK and 4X1AT, editors).

* Satellite enthusiasts and AMSAT members are advised that the former *Amateur Satellite Report*, now called *Oscar Satellite Report*, no longer is included in AMSAT membership. As of April 1, *OSR* is received by subscription from R. Myers Communications, PO Box 175, Litchfield CT 06759. AMSAT has, according to Myers (who is W1XT), "provided encouragement and support" during the changeover. Myers has been editor of the publication since its inception in 1981.

* Ham club officers will be interested in the latest (1990-91) edition of the *ARRL Club President's Workbook*. Complimentary copies already have been sent to ARRL officials and ARRL affiliated club presidents. Additional copies are available from HQ.

* Is there anyone who doesn't love museums? We can heartily recommend the Antique Wireless Association's museum, located in the Finger Lakes region of western New York, near Canandaigua. The whole family can enjoy this trip back in time, as the AWA Museum features not only Amateur Radio but just about every kind of wireless, as well. Next door is the East Bloomfield Historical Society with exhibits of interest to everyone.

AWA Museum hours are 2-5 pm Sunday, 2-4 pm Saturday, and 7-9 pm Wednesday, through Oct. 31. Group tours are available by appointment. Bruce Kelley, W2ICE, is curator. AWA Museum, Main Street, Holcomb NY 14469. Phone 716-657-6260.

* First call for papers for the AMSAT-NA Space Symposium, to be held Oct. 10-12 in Houston. The symposium will feature talks on the latest technology in both the manned and unmanned aspects of the Amateur Radio space program. Talks on MICROSAT utilization are particularly wanted. Send summaries of proposed papers to AMSAT-NA, 850 Sligo Ave., Suite #600, Silver Spring MD 20910 by July 15. Those selected for presentation will be notified by August 1.

....Stuff about ungrounded filters and a CORRECT explanation...
>>
>>It works just fine. I guess a lot of people are confused about this, so
>>I'll expand further.
>>
>>The transmitter generates RF voltage BETWEEN the center conductor of the
>>output coax and the shield. Note that this voltage is NOT referred to
>>earth ground. The chassis could be at 1,000,000 volts (AC or DC) with
>>respect to earth, but there is still the same RF voltage existing between
>>coax center conductor and shield -- the transmitter doesn't care.
>>
>>AL N1AL

...And now the wrong answer...
>
>I'm afraid that YOU are the one that is confused. When an unbalanced filter
>is used to bypass unwanted RF energy to the chassis and the chassis is
>not connected to ground, the chassis structure and the outside of the
>coax shield, the microphone cord, the powerline, and any other wires
>connected to the chassis become RADIATING ELEMENTS for that unwanted
>RF. Thus the desired effect of preventing unwanted radiation is lost.
>The currents between the coax center conductor and shield are supressed,
>but that is of little use if the outside of the coax becomes "hot".
>
>Gary KE4ZV

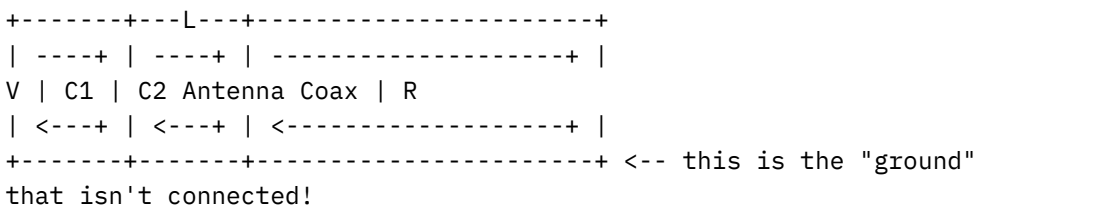
Gary, get your electrical engineering books out, and look up a Faraday
shield. That is the thing that you get when you make a tight metal box.
The shield (note the name) on the coax is also an example of a Faraday
shield.

The transmitter is full of RF generating stuff that has frequencies that
we don't want to radiate, so the manufacturer bottles it all up in a "tight
metal box", and filters the unwanted RF off of any leads that leave the box.

NO RF can get out of the box anywhere except thru the Coax.

All of the "unbalanced filters" literally short out the coax for frequencies
that are unwanted. This has the effect of sending the unwanted freq's
power back into the transmitter where it is dissapated as heat.

As an example, look at this PI filter. Remember that at "High" frequencies
capacitors get lower in reactance (kinda like resistance), and inductors
get higher in reactance. Notice how C1 and C2 conduct the High frequency
current back to the voltage source, and how L blocks the High frequencies by
being a high reactance (open circuit).



Current can only flow where there is a circuit. This filter's circuit is complete whether or not there is a ground connected anywhere along the bottom "wire".

How does the transmitter's case get "hot" with RF? It does so by near field coupling with the antenna. If you would feed your balanced "dipole" like antenna with a balanced source (eg. use a balun), and move the antenna out of your bedroom you would find that much of your problem would go away.

>>>Can someone please tell me why phase noise is NOT considered a form of FM
>>>modulation?
>
>First, let me say that I'm no expert on the subject -- I've done a little
>work with it, though.

From your post, I assume 'a little' is a lot more than most!

>Phase noise CAN be considered to be a form of FM modulation (or,
>alternatively, Phase Modulation). Essentially, the phase of a CW signal is
>varying over time. The reason that Phase Noise on a carrier looks
>so radically different than narrowband FM (with two discrete sidebands)
>is that the phase varies RANDOMLY with time. This random variaion
>causes the characteristic "smearing" of the CW signal

Of course! This makes sense. When I look at a true FM signal, it is usually
being driven by a constant tone. The tone combines with the sweep rate of the
spectrum analyzer to give the output display I'm familiar with. Even a signal
that causes very little deviation of the FM carrier would appear different than
true phase noise. Thanks for the clarification.

>There are four basic methods to measure the phase noise of a CW source:
> 1. Measure it directly with a spectrum analyzer
> 2. Mix the signal down to a lower frequency and use a counter
> to measure the variance of the frequency.

Doesn't this mean you need to sue a LO that is MUCH more stable than the
amount of phase noise you are trying to measure? Then again, I guess the
spectrum analyzer LO must also be very pure to make this kind of measurement.

> 3. Use a phase detector to measure the difference in phase
> between your source and a reference source. The output of
> the phase detector is displayed on a spectrum analyzer.
> 4. Use a frequency discriminator to demodulate the "FM" signal
> and measure the output on a spectrum analyzer.

I guess this assumes that the discriminator is capable of doing some very
quick and accurate demodulation of the signal. If phase noise is truely
random (which it must be to be considered 'noise'), what kind of instantaneous
jumps in discriminator output would one observe using this technique?

>I hope this answers your question. Phase Noise is actually a very
>interesting subject, once you dig into it. It's also one of those
>subjects that are rarely discussed a standard E.E. curriculum.

I know only two RF gurus that are really comfortable talking about this subject. It is HIGHLY important for good communications work, though. They both learned in the lab by looking and playing, with a little help from mentors who knew more than they. Are there any good tips or techniques you (or anyone) can suggest to ensure good phase noise performance?

Message-ID: <11914@netcom.UUCP>
Source record: 10387

In a previous article, faunt@dustbin.cisco.com (Doug Faunt N6TQS 415-688-8269) writes:
>I would like to be able to run a standard PC/AT clone on 12V,
>efficiently. Where can I get information on buying or building a
>reasonably low cost power supply for this?
>thanx, and 73, doug

I have done this for a project. We used deep cycle marine batteries to supply the 12 VDC and a power inverter to provide 120 VAC. We found that to drive a monitor, we had to have 120 VAC and couldn't just do conversions with DC-to-DC converters. For the power inverter, we found that the typical square wave output seemed to work just fine for the PC. We did this for a PC-XT and a PC-II a few years back. The power inverter we used was from GTO Electronics and had a model number of PACS-325SM. The latest info on address for GTO I have is:

GTO Electronics
430 Ritt St.
St. Peter, MN 56082
(507) 931-4137

This stuff is dated 1985, so may be a little old. We used a regular old car battery charger to charge the batteries. Don't use regular car batteries. They don't have the ability to deep-cycle many times, which is what I assume you want. The system shipped to Italy, and last I heard they had replaced our battery charger with a local equivalent that ran off local power, but the rest of the system worked fine.

Hi,

I'm receiving polar orbiting weather satellite photos on my system
and I would like to plot latitude and longitude lines, coastlines
etc on them.

Does anyone out there have the algorithms required to translate
scan line pixels to lat & long or vice versa?

Cheers,

Chris.

> general interest, please send e-mail. TNX.
> - Jordan, n5qvi
>

As such there are several classes of RADIOTELEPHONE Operator Licenses.
The General RTPOL is issued to all previous holders of First Class and Second
Class Licenses and Third Class Permits (47 CFR 13.2). The General RTPOL
is valid for the lifetime of the holder (47 CFR 13.4). The Exam, taken
after the paperwork, covers only Element 3. Radiotelephone Licenses may
be renewed upto five years after expiration with loss of operating
priviledges during the grace period.

"(3) Technical, legal, and other matters, including basic operating
practices and provisions of laws, treaties, and regulations,
applicable to the operation of radiotelephone stations other than
broadcast. (47 CFR 13.21(3)) ".

Transmitter operating, maintenance, and repair duties of transmitters
used in accordance with Parts 73, 74, 80, and 87 of 47 Code of Federal
Regulations may require a licensed commercial operator (47 CFR 13.61).
Part 73 is Radio Broadcast Services i.e. AM, FM, TV, etc. Part 74 is
Experimental, Auxiliary, and Special Broadcast Services. Part 80 is
Stations in the Maritime Services. Part 87 is Aviation Services.

All citations are from the 1986 edition of CFR, changes may have occured.

ADVICE Warning!!!!!!

Unless you intend to use an EE degree to repair transmitters,
then a General RadioTelephone Operators License is of small
value. Good engineering practice in the design of RF circuits

is more valuable than the rubber stamp of the FCC. RF circuits
can be designed to be both rugged and frequency stable. Commercial
operators are needed to keep the transmitters in good working order,
i.e. on frequency and with in the power envelope. I am a degreed
Electrical Engineer and a licensed General Radiotelephone Operator,
and I have repaired transmitters for a living.

Wayne does drop a few pearls of wisdom now and then (e.g., his strong support of no-code and the role that amateur radio should play in encouraging young people to enter technical careers, even if he does overstate the League's culpability in destroying American technological prowess.)

But he squanders any credibility he might have gained when he mixes in his off-the-wall ramblings about Scientology or UFOs or whatever. Not to mention his continuing to carry the Maxcom antenna-matcher ads. Two Daytons ago I confronted him about these frauds. Believe it or not, he actually tried to tell me that he had no control over what his Editor-in-Chief printed in the magazine he (Wayne) published...

Message-ID: <1990Jul11.051107.23603@bellcore-2.bellcore.com>
Source record: 10393

Low frequency (e.g., AM broadcast band) interference generated by appliances is almost always conducted back out the AC power cord and either radiated by the house wiring or conducted directly into a receiver. Many tabletop receivers use the power cord as an antenna, so interference isn't that surprising. Try putting an AC power line filter on the lamp and see if that helps. You can find power line filters of all shapes and sizes at just about any hamfest, including units with built-in AC power line connectors.

4138. AM Noise from Flourescent Lamps

Newsgroup: rec.ham-radio
Date: 1990-07-11 11:44:36 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9007111144.AA02472@cmr.ncsl.nist.gov>
Source record: 10394

Phil Karn says that some AM radios use the line cord for the antenna. I'll agree if he changes this to ** FM **. All the built-in-antenna AM radios that I have seen (back to 1939 or so) used a loop. In the last few decades it has been wound on a ferrite core. This is generally tuned and is the entire pre-mixer selectivity.

The loop is far less sensitive to conducted noise than using the power line.

Phil is RIGHT in identifying that the noise is getting out of the lamp onto the AC line. Has the line filter gone bad?

Couldn't let this pass (;<))) (Yes, I'm getting a double chin.)

4139. Bearcat 200XLT mods (QUERY)

Newsgroup: rec.ham-radio
Date: 1990-07-11 12:48:06 UTC
From: fayne@tellabs.com
Message-ID: <2981@tellab5.tellabs.com>
Source record: 10395
Cross-posted to: rec.radio.shortwave,rec.ham-radio,sci.electronics

I'm sure this has been requested before, but I don't have any previous
requests in my archives:

I just picked up a Bearcat 200XLT and was wondering what sort
of mods are available (ie. blocked out freqs, scan speedups, etc.)?

I've seen ads for a book by Dr Rigor Mortis (nice name :)) that
covers mostly the PRO series but is supposed to have mods for the
200XLT. Does anybody have a copy of this book and if so what are
the mods for the 200XLT? BTW, anybody in the Chicago area know where
this book is available?

Any pointers or any "Gee, all you gotta do is clip out the third
diode from the left" type info would be greatly appreciated :^)

Thanks in advance,

Jeff

> code. If the practice were uniform, your "RST 559" would become "RST
> FFN". The problem with this, of course is that you do not know if you
> received a 559, 549, or 449!

An interesting thought, and if your interpretation of "N" was correct,
then probably it would also be true. However, the "N" doesn't stand for
"Nine" it is cut-code -- asystem of dash concatenation in sending numbers.

"N" is a number consisting of dashes followed by a single dit. the only
number that meets that description is 9. Sending a "D" would mean
dashes followed by two dits (8) sending an "A" would mean a dit followed
by all dashes (1) sending a "U" means two dits followed by all dashes
(2) etc. Thus 5 remains a series of 5 dits, since there are no dashes.
10 concatenates to "T".

Cut-code was developed by your beloved commercial telegraphers who did
not receive early retirement for the practice,nor were they considered
LIDs. The dah concatentation was considered a good thing because dah
were hard to send on a bug, while dits just required holding the paddle.
Cut code was (and still is) only used when there it is unambiguous that
you are sending a number.

>Al N1AL

All of the above is true, including the part quoted from my earlier posting. The apparant difference between our views is that your explanation is correct in theory and mine is true in practice. The difference between theory and practice is due to the fact that practical flexible coax doesn't have perfect shielding, the skin effect depth is greater than the depth of the shield, the transmitter chassis is not a perfect Faraday cage, and misc other cables exit and enter the transmitter cabinet to interconnect other necessary operating equipment. All of this creates a SYSTEM that will radiate. I have fought these problems in practice for 25 years at broadcast plants and amateur installations over much of the Eastern US. Careful grounding has been the only practical answer to these problems.

In mobile installations, we have to make every part of the system as tight as possible so that we approach as closely as possible the theoretical case since we have no large disipative ground field to take care of incidental radiation. Luckily most mobile installations use relatively low power and any leakage is not severe. In addition, the mobile system is inclosed in a metal structure (car, plane, etc) that acts as a second shield. However, in high power fixed installations, the problem can be really severe even after we have tightened every leakage point as much as is practical.

This is not voodoo electronics, this is the real world.

Source record: 10398

N2KRQ purchased this amplifier for mobile use,working
with KZ2X,W2DDN & KB3TS during the installation of this
amplifier it was noticed that the center pin on the 10 volt
output jack of the amplifier was negative and the center pin
of the input jack on the Kenwood TH225 was positive.A word
of caution to all HAMS considering purchasing this amplifier
to observe the polarity of the connector.
Once properly installed the Alinco Amplifier performs
like a champion and N2KRQ is a satisfied customer.

It is to laugh. If you really believe this, you haven't TESTED some of the
equipment in regular use.

>
[simple theory of filters stuff deleted]
>
>How does the transmitter's case get "hot" with RF? It does so by near
>field coupling with the antenna. If you would feed your balanced "dipole"
>like antenna with a balanced source (eg. use a balun), and move the antenna
>out of your bedroom you would find that much of your problem would go away.

OK, this is real. Feeding a balanced antenna with an unbalanced line is
a no no. Of course, in this case we are talking about RF of the fundimental
frequency coming back down the coax not incidental radiation at undesired
frequencies which is what this disscussion started out to be about.

Please note that I don't disagree with the theory that several posters
have quoted. I am merely trying to point out that, in practical equipment
that I have had personal experience with, things aren't so simple.

Re: Kerchunking

I've been thinking and watching this discussion. I have some understanding
of the irritation that frequent kerchunking can bring but, in some ways,
kerchunking is useful.

I carry my Icom 02AT when I go dayhiking in the mountains here in
Colorado. I regard it as a safety device. I cover various parts of the
state and don't necessarily know where the repeaters I reach are.
If I should need communications for an emergency, I would probably
wind up in a search-for-a-kerchunk mode to find a usable repeater since
I don't carry the weight of a repeater directory (yeah I could copy the pages
but it still leaves an awful lot of choices to try) nor can I be
sure of what I can reach (one side of a ridge will have a different
selection of machines than the other side). Minimizing transmit time
would definitely be a concern in the situation where battery conservation
is required so a kerchunk would be more efficient.

Without kerchunking, I might have to listen all day (especially during
the week) to find a usable repeater. With repeaters that don't kerchunk,
I might not find them at all.

Then again, I suppose most of the concerns come from urban areas. Hell,
(old fart voice ON) I remember when you could ragchew on the Tyson's Corner
34/94 machine in N. Virginia.... (old fart voice OFF)

Maybe if the UPS had taken 2 meters we would all be better off..... :-)

4145. Ramblings on Low Pass Filters

Newsgroup: rec.ham-radio
Date: 1990-07-11 15:19:23 UTC
From: elmore@virga.ucar.edu
Message-ID: <7950@ncar.ucar.edu>
Source record: 10401

All of this stuff about LP filters fascinates me. As an Asst. Tech. Coordinator for the ARRL (or Evil Empire, take your pick) I get to play with lots of TVI cases. Especially so since near Denver we are cursed with a channel 2 *and* a channel 6!

Anyway, a few months ago someone wrote an article in QST about dissipative LP filters. I think it was Jon Bloom. Anyway, he pointed out that all a filter does is present a mismatch to the unwanted frequencies and that if the filter were made up only of reactive components, none of the unwanted energy would be dissipated, only reflected. Thus it may get dissipated someplace, but then it just may get radiated, too.

Well, having built a dissipative LP filter, it isn't for the timid. I'm not sure how you'd build one without some good inductance and capacitance meters and get it to work. But, what about some ferrite beads slipped over the coax on either side of the filter? Wouldn't they act to dissipate whatever "gets out"? Now, I'm only a research meteorologist, not a EE, but it makes sense to me.

Turns out that my ground system looked like a 1/4 wave at 56 MHz... So I tried this. It appeared to work very well. I also used the dissipative filter ("Heck, I built it... might as well.") and it helped a little, too. But, by far most progress seemed to be made by judicious use of ferrite beads in strategic places. The idea was to turn the unwanted RF into heat in a controlled fashion, instead of depending on it finding its way to earth ground.

So, all you EE gurus out there: Is this voodoo? Am I all wet? Was I just incredibly lucky? What have I missed?

4146. Kenwood RZ-1 Birdies

Newsgroup: rec.ham-radio
Date: 1990-07-11 15:23:21 UTC
From: charlie@oakhill.UUCP
Message-ID: <3516@radio.oakhill.UUCP>
Source record: 10402
Cross-posted to: rec.ham-radio,rec.radio.shortwave,rec.radio.noncomm

I purchased (as-is) a Kenwood RZ-1 wideband receiver at a hamfest (you know that place where 'honest' people go to give you an 'honest' deal). The thing was dead below 60 MHz. I sent it to Kenwood and for a reasonable price they replaced all the band switching diodes in the front end (this radio is surface mount technology and a bitch to work on). Apparently someone had shot a good dose of RF energy up the radio's antenna terminals thus blowing the diodes (nice going bright guys). The radio has bigtime birdies. Lotsa birdies. I traced the source to the control microprocessor. I added a supply bypass cap and the noise went down somewhat but it still has lotsa birdies! The Kenwood service tech says the 2 MHz clock on the control board radiates harmonics. OK so why do I have birdies at less than 2 MHz intervals?? No answer from Kenwood.

My question is ..... does anybody else have one of these little beasties? No self-respecting Japanese engineer would have let this type of behavior out of the design lab and I think there are some surface mount bypass caps that have cracked...thus causing the radiation. I don't believe this is normal behavior for the radio although Kenwood hinted that nothing could be done.

Thanks in advance,

Charlie Thompson (birdwatcher) WB4HVD

YES, you can pole the status of the radio. In the case of the Kenwood line of HF radios, TS-140/440/940 you send it the INFORM command thus...

IF;

The radio will respond with a string of about 36 ASCII characters which you must then break up into fields. This string contains the current vfo frequency, mode, Rit On/Off status, Rit offset, Split on/off, rx/tx, and other goodies.

Reactive filters reflect power back to the source, so whether or not harmonics are radiated depends on what the source looks like. If there is no way for the harmonics to leak out of the source, they will not radiate. Unfortunately, many transmitters and amplifiers are not shielded and filtered well enough to prevent this type of radiation. A dissipative filter may help, but a more reliable solution is usually to shield and filter the RF source. This means, of course, that ALL the wires and cables passing through the RF source shield must be filtered. It's not always easy to do, but it is foolproof. If the harmonics can't get out, they can't radiate. Then it makes no difference how the system is connected to earth ground. Measures such as improving ground connections and placing ferrite beads all over the place are likely to be marginally effective methods of reducing radiation of harmonics which should never have been allowed to get out of the final amplifier in the first place.

While this is true in some cases for commerical traffic, it is
ABSOLUTELY WRONG in NTS procedure. The entire preamble of an NTS
message is sent with no punctuation or additional verbiage (excepting
the NR on digital modes <yes, CW is digital> and the word "number" on
voice modes), regardless of mode. "II" normally means that the
operator has made a mistake and will resend the previous word.

>"DE Callsign" is an extended break-in process except when fulfilling the
>10-minute identification rule. You are not required to send the other

>

This is not true. The only time you are EVER required to send the
other station's callsign is when you have just passed a piece of 3rd
party traffic to a station not in the U.S.

>"SK", In traffic handling parlance means you have sent the last of a
>series of messages and have no other traffic to send. (You never send

The "SK", though part of the procedure in commercial traffic, is
ununsed in NTS traffic handling. You may use it as part of completing
a pairing on a net but it is not a part of the traffic itself. On CW,
a message ends "AR B" or "AR N" indicating more traffic or no more
traffic to follow, respectively.

>
>Doesn't this mean you need to sue a LO that is MUCH more stable than the
>amount of phase noise you are trying to measure? Then again, I guess the
>spectrum analyzer LO must also be very pure to make this kind of measurement.

Correct. This is why LO phase noise is an important spec for
spectrum analyzers. As you might expect, high priced spectrum analyzers
have the best phase noise. Lower priced instruments can have quite
bad phase noise. In any case, if you doing the measurement using a
spectrum analyzer, it's important for you to check the specs on the
instrument. 20 dB better than what you are measuring should be o.k.

>> 3. Use a phase detector to measure the difference in phase
>> between your source and a reference source. The output of
>> the phase detector is displayed on a spectrum analyzer.
>> 4. Use a frequency discriminator to demodulate the "FM" signal
>> and measure the output on a spectrum analyzer.

>>I guess this assumes that the discriminator is capable of doing some very
>>quick and accurate demodulation of the signal. If phase noise is truely
>>random (which it must be to be considered 'noise'), what kind of instantaneous
>>jumps in discriminator output would one observe using this technique?

The discriminator should have the same bandwidth as you are trying to
measure for the phase noise. For example, if you want to look at the
phase noise 100kHz away from the CW signal, you will need at least 100kHz
of discriminator bandwidth. This is usually not a big problem because
we are most often interested in phase noise close in to the signal.

>> Are there any good tips or techniques you (or anyone) can
>>suggest to ensure good phase noise performance?

I, like a lot of others, learned from a good mentor. A good
reference book is:
"Phase Noise", A. Robbins (I think this is right)
If you are really more interested, drop me a note by e-mail and
I can try to find some copies of the H.P. application notes about
phase noise. They're pretty good (i.e., readable and down to earth).

I've tried this operation, also, in my alinco 230 amplifier (with pre-amp). I found that the ratings on the output power jack of the amp SHOULD have allowed me to operate the HT in low power directly from that jack. In reality, when I key up the HT using the amp as the power source, the thing shuts down completely. Power cycling the amplifier makes it work again.

Anybody else seen this? I simply gave up on that connector and don't use it.

Chris

Yes, Apple has done fine, but I don't think we can give Wayne Green credit for it. :-)

I'm not aware of any hams in the early Apple staff. We had a veep a few years ago, but that was 'way after the period you're talking about. And we didn't get John Sculley (ex-ham) until just few years ago. So as far as Apple is concerned, I don't know of any hams who took Wayne's advice to make money from microcomputers. Any of the other Apple hams out there know of any?

I agree with Phil Karn: Wayne has some good ideas, but they're lost in the noise. Besides, people who are against more things than they're for drive me up the wall.

>Just a bunch of rabblerousers, armchair lawyers and
>frustrated police-wannabe's for the most part (rec.ham-radio is an interesting
>microcosm of all this).

I'm sorry that this has been your experience. Yes, there's too much of this kind of activity. But there are also lots of super nice people, including some who will travel anywhere anytime to help with emergency communication. I know because there are many of those people in my area. I strongly suspect that there are plenty of nice hams in your area, too.

Patty

p.s. I'm actually a contractor, just for the record.

Actually, it would be best to use the address I posted in my followup
to the beacon question last week. Refresher course:

NCDXF
P.O. Box 2368
Stanford, CA 94309

That way it will be given directly to the person who handles information
requests.

73,
Patty

4156. Bearcat 200XLT mods (QUERY)

Newsgroup: rec.ham-radio
Date: 1990-07-11 17:52:59 UTC
From: fayne@tellabs.com
Message-ID: <2987@tellab5.tellabs.com>
Source record: 10412

I'm sure this has been requested before, but I don't have any previous
requests in my archives:

I just picked up a Bearcat 200XLT and was wondering what sort
of mods are available (ie. blocked out freqs, scan speedups, etc.)?

I've seen ads for a book by Dr Rigor Mortis (nice name :)) that
covers mostly the PRO series but is supposed to have mods for the
200XLT. Does anybody have a copy of this book and if so what are
the mods for the 200XLT? BTW, anybody in the Chicago area know where
this book is available?

Any pointers or any "Gee, all you gotta do is clip out the third
diode from the left" type info would be greatly appreciated :^)

Thanks in advance,

Jeff

Unless something has changed recently (are you there, KA6S?), it doesn't matter whether it's a domestic QSO or not. All U.S. hams have to do is ID at the end of the QSO, and every 10 minutes if it's longer than that.

However, if you're transmitting third-party traffic, you do need to give the callsign of the station you're talking to, at the end of the QSO.

Patty

p.s. I left the default distribution on this because I know there are some overseas hams who hold U.S. licenses or operate here under their home calls.

p.p.s. How come lots of postings I see don't have a specified distribution? Are there news posting programs that don't require it? Does that mean they don't even prompt the poster to make a choice? Seems like that could account for a lot of postings that wind up with worldwide distribution unnecessarily.

Date: 6 Jul 90 02:58:19 GMT
Distribution: aus
Organization: CSIRO DIT Sydney, Australia

Formative Meeting for an
Australian Amateur Space Engineering Group

1. Possible projects. Initial suggestions are:
- take on the construction of an Australian AMSAT.
(Already proposed in association with the ALV project.)
- a small space science payload.
- an orbiting telescope (bandwidth?).
- discussion of launchers (to build, buy, borrow, or piggyback).

2. Resources avaiable. This includes
- money
- time
- expertise
- engineering support - facilities, etc..
- operational support - ground stations, etc., many of which
already exist for AMSAT.

3. Organizational structure and methods of communication.
This includes the number of people to involve, and the issue
of whether or not to become a formal group.

4. Existence of related groups, and the formation of
relationships with them.

Contact: Craig Lindley, 887 9441
email: lindley@ditsyda.oz

> any of these computer interfaces.

The Kenwood radios definitely offer what you need, in two ways:
1. You can poll the current state of the radio (not just frequency
but various mode information as well)
2. You can instruct the radio to report the state whenever it changes,
automatically. When you tune around the band, the report comes out
as soon as you stop moving the tuning knob for about a second.

Either mechanism is great for logging. I've used #2 to check for subband
violations or contest-specific band limits (put up a bold blinking message
when the frequency is wrong). Kenwood has a datasheet for the computer
connect box that gives one-line summaries of the commands. More details
were posted here on the net a year or two ago.

4161. Re: Kenwood TS140s computer interface ? & TS140s vs TS440s

Newsgroup: rec.ham-radio
Date: 1990-07-11 18:45:55 UTC
From: charlier@hplsla.HP.COM
Message-ID: <5720074@hplsla.HP.COM>
Source record: 10417

OK, there seems to be some interest, so here's the command set for the
TS-440. I have received mail from someone who tells me that, yup,
ALL the kenwood rigs understand pretty much the same commands.

Command Descriptions for Kenwood TS-440

Auto Information
AIn; The radio will send the status info automatically when
the operator changes any control covered in the IF;
command.
n = 0 for Auto Info OFF
n = 1 for Auto Info ON

See IF; for response

Display Memory
DMnnnn; This is a factory diagnostic and is of no practical
use.

nnnn = MPU address in hex

Response is:
DMnnnn-aabbccddeeffgghhiijjkk;
nnnn = MPU address in hex
aa~kk = 16 bytes of data in hex

Down
DN; The frequency or memory channel will go down by one
step.
(KX7L note: The UP; and DN; commands seem to have a bug, at least
in our '440. It will only let you do one UP or DN cmd. i.e.
UP;UP;UP; changes the frequency the same as UP;)

Read Frequency
FA; Read VFO A.
FB; Read VFO B.

Response is:
Fxggmmmkkkhhh;
x = A or B
gg = GHz.
mmm = MHz.
kkk = KHz.
hhh = Hz.

Load VFO register
Fxggmmmkkkhhh; Loads a frequency into a VFO:

x = A or B (selects VFO)
gg = GHz. (May be 00 or spaces)
mmm = Mhz.
kkk = KHz.
hhh = Hz.

Function Select
FNn; Select VFO or memory
n = 0 for VFO A
n = 1 for VFO B
n = 2 for memory

Identify Model Request
ID; The radio will respond with:
ID001; for a TS-940
ID004; for a TS-440

The radio may respond with:
ID002; for a TS-811
ID003; for a TS-711

Read Information Request
IF; The radio will respond with:
IFggmmmkkkhhhsnnnzrxyytdfcp;
ggmmmkkkhhh is the frequency (See Fx;)
s = "+" or "-" value of RIT/XIT
nnn = value of RIT/XIT
z = "0" (I am not sure what this is)
r (see RT;)
x (see XT;)
yy = memory channel number
t = 0 for Receive
= 1 for Transmit
d (see MD;)
f (see FN;)
c (see SC;)
p (see SP;)

Lock Knob
LKn; Enable or disable manual frequency control:
n = 0 for LOCK OFF (manual control enabled)
n = 1 for LOCK ON (manual control disabled)

Memory Channel Select
MCmmm; Select a memory channel:
mmm = channel number (000 to max for radio)

Mode Select
MDn; Select mode:
n = 1 for LSB
n = 2 for USB
n = 3 for CW

n = 4 for FM
n = 5 for AM
n = 6 for FSK

Memory Read
MRnrrr; Read contents of memory channel:
n = 0 for RX VFO
n = 1 for TX VFO (split channels only)
rrr = channel number (000 to max for radio)

The radio will respond with:
MRnrrrggmmmkkkhhhdxxxxx;
n = 0 for RX VFO
n = 1 for TX VFO
rrr = channel number
ggmmmkkkhhh is freq. (See FA;)
d = mode (See MD;)
xxxxx = not used (seem to always be "0 ")

Memory Write
MWnrrrggmmmkkkhhhdxxxxx;
Write a memory. See MR; for format

RIT/XIT Clear
RC; The RIT/XIT register will be set to 0.00 KHz.

RIT/XIT Down
RD; Decrement the RIT/XIT register by 0.01

RIT/XIT Up
RU; Increment the RIT/XIT register by 0.01

RIT Enable
RTn; Enable or diable the RIT function
n = 0 for RIT OFF
n = 1 for RIT ON

Receive
RX; Enter receive mode.

Scan Enable
SCn; Turns scan on and off
n = 0 for Scan off
n = 1 for scan on

Transmit
TX; Enter transmit mode.

UP
UP; The frequency or memory channel will increment one
step

XIT Enable/Disable
XTn; Turns XIT on and off

n = 0 for XIT off
n = 1 for XIT on

Well, we could argue the point ad nauseum. I think the main thrust of ham radio in the future (although obviously not to the total exclusion of all else) is in the area of computer networking. Most of the opportunities for research that were listed also happen to be the main reasons why HF is not particularly suitable for mainline networking. That it works at all on HF is a marvel.

In the first place, I don't think we are going to gain HF bands anyway. From what I have read, it is entirely possible we may lose 30 meters and 40 meters to SW broadcasting. (Talk about your basic dinosaurs!)

>"RST 559" is the correct way to send a signal report. 55N has no defined
>meaning - it is absolute laziness to not send the character "9" in morse
>code. If the practice were uniform, your "RST 559" would become "RST
>FFN". The problem with this, of course is that you do not know if you
>received a 559, 549, or 449!

I don't know the history of sending 'N' in place of 9. However, based on other letters that are similarly abbreviated, the 'N' is not an abbreviation for the 'n' in Nine, but rather the abbreviation for "----." Here are the common abbreviations

0 - T
1 - A
9 - N

Numbers are special because there's a pattern to them. Once you hear the transition from "dah" to "dit" you know what number it is. For example, once you hear two "dits", then the first "dah", you know the number is going to be a 2. So you could (if you wanted to), abbreviate 2 as U. So I would guess that T means 0 because there are no dits to transition to. A means 1 because once you get the 1st dit, then the 1st dah, you know the rest are dahs and you know it's a 1. So actually, by this pattern, you would abbreviate 6 as dah-dit (which is an N), but someone decided this would be 9. I wouldn't abbreviate 5 as F, but rather as E (see the 0 case above).

I don't think sending 'N' instead of '9' is a bad practice at all, why waste our bandwidth sending stuff that can be abbreviated? 9 is one of the longest characters in the entire code (besides 0) anyway.

4165. Antenna question

Newsgroup: rec.ham-radio
Date: 1990-07-11 19:49:47 UTC
From: perley@trub
Message-ID: <9638@crdgw1.crd.ge.com>
Source record: 10421

I was planning on making the delta-v antenna described in the recent antenna issue of Ham Radio (may?), and have a couple of questions.

Since this a high impedance (800 ohm) non-resonant antenna with a terminating resistor, is it safe to assume that the wire conductivity is less important than with a resonant antenna? I was hoping to use 14 guage steel fence wire (at ~1 cent/foot, plus I already have enough) rather than copper.

Second, what is the usual practice for enclosing the terminating resistor? Since it may have to dissipate up to 100 watts (not with my current rig), an airtight enclosure doesn't sound ideal. Per the article's suggestion, the termination will be 50 39 Kohm 2 watt resistors in parallel.

] >[...]
]
] I'm afraid that YOU are the one that is confused. When an unbalanced filter
] is used to bypass unwanted RF energy to the chassis and the chassis is
] not connected to ground, the chassis structure and the outside of the
] coax shield, the microphone cord, the powerline, and any other wires
] connected to the chassis become RADIATING ELEMENTS for that unwanted
] RF. Thus the desired effect of preventing unwanted radiation is lost.
] The currents between the coax center conductor and shield are supressed,
] but that is of little use if the outside of the coax becomes "hot".

It still seems to me that the "floating" coaxial filter would do a good job,
*provided*that* the transmitter shielding is good and the cable from the
transmitter to the filter is short. A completely shielded enclosure
will not radiate, regardless of what is inside, or what is connected to
the outside. If the filter is very close to the enclosure, it can be
considered as part of the shield, and will isolate the external
connections from the internal ones. Of course real-world filters and
shields are not perfect, so maybe that's what we are shouting about (er..
"discussing")..

In any case, perhaps this argues for the use of the "dissapative" type
of filters (the ones that are effectively diplexers with dummy load
to convert the spurious R.F. to heat). Thus you dont have as much of
a problem with stray R.F. circulating around, looking for a way to get out.

Source record: 10426

As in so many other discussions, here is another case of different arguments being correct while at the saame time not addressing the central point. In this case, TVI. What has been neglected up to now is the fact that it is the receiving point, not the transmitting point, that is getting the interference. Al (N1AL) correctly points out that unwanted radiation *going to the antenna* is filtered out. Correctomento. But TVI may not be introduced from the transmitting antenna: As someone pointed out, it can come from the feedline, or any other metal object connected to the transmitter.

The confusion seems to arise over what is the common point. The only point that is common to both the transmitter and the TV in this hypothetical problem is the ground...Earth Ground. Therefore, any rf potential that is generated with reference to Earth Ground is likely to be seen by the TV. Unless some point of the transmitter (usually its "ground") is connected to the Earth Ground, any rf potential between any point of the "floating" transmitter and Earth Ground may become TVI. Phase differentials generated within the set, and even within the filters themselves, can create enough rf potential to cause problems.

I think your best and easiest move to try to eliminate TVI is to use a good Earth Ground for your transmitter first, and then use filtering and shielding.

73,
Dube Todd N5PDK

Andy, the server is still up and running! The log shows requests from
you on 6/14, 7/3, and 7/11. No bounces on any of them. Btw, the
first two requests came from dxandy%widener.bitnet@cornellc.cit.cornell.edu,
and the last from dxandy%widener@pucc.princeton.edu.

If you or anyone else is having problem receiving replies from the server,
you might try including a "path" command in the text of your message. For
example:

path user@domain
or
path bang!path

as appropriate. The path should be either a domain address accessable from
the internet, or a uucp bang path (relative from uunet is fine; my mailer
knows at least how to get there).

The path shouldn't be necessary, of course, but it's there if needed. If
you can't seem to get it to work at all, please drop me a note!

So you could leave the chassis ungrounded, and NOT experience the "hot
chassis" phenomena that you have when the ground lead is high impedance?

Everything seems to work a lot better in my station with it grounded!

> I strongly suspect that there are plenty of nice hams in your area, too.

I attended the Central Division convention in Indianapolis last week. At
the banquet on Saturday night a number of awards were given out. Nothing
unusual about that, right? But these awards were given to hams who had
provided tornado tracking information (from the field, you understand,
where the tornadoes were); who ran the net supplying, as the National
Weather Service official at the banquet said, "the meteorologists dream:
more data than we could even process"; and who organized the program with
the help of RACES and the state emergency management folks. (The state
emergency management director handed out some of the awards.) Of course,
by the tenets of some people on this net, these folks are just old farts
stuck in the past because they aren't experimenting with microwaves or
computers. Feh!

(That last comment isn't intended to apply to Patty, BTW. Her posting
just provided a convenient place to say this.)

|> For the power inverter, we found that the typical square
|> wave output seemed to work just fine for the PC.

On the subject of power inverters, anyone looking for one should be aware that the technology has progressed quite a bit in the past 5-10 years. The main advance has been the power MOSFET. Units with remarkably low "on" resistances are available, and their use in inverters greatly increases efficiency. For example, my Heart Interface 600W model is rated at 95% efficiency at about 100 watts, and it stays in the 90's up almost to rated power. The older bipolar units are lucky to make 70-80%. And my unit draws only about 70mA when idling, so I don't even bother to turn it off when I'm not using it.

Another advance has been what's called the "modified sine wave" output. This is not actually a sine wave, but a square wave modified to have 50% duty cycle, i.e., 0V, +160V, 0V, -160V, etc. This waveform is nice because it simultaneously matches the peak and RMS values of AC power, so it can be used with peak-responding loads (like power supplies) along with RMS-responding loads like lamps. Older square wave units will either burn out light bulbs if they are set to produce the necessary peak voltage for power supplies, or they will not produce enough raw DC voltage in a power supply if they are set for lamps. Another big advantage of the modified sine wave inverter is improved efficiency; the "off" period between each peak voltage swing avoids the current spike that occurs in square wave inverters when both transistors switch simultaneously.

So I would look around for one of the newer MOSFET/modified sine wave units, as I think they are worth the extra money. (Note that the common TRIPP-LITE units are mostly square-wave units.) Heart's main competition is Trace; their products and prices are comparable, although Heart seems to be going after the marine/RV market while Trace sells primarily to the alternative/off-grid energy market.

I use my inverter in a continuous online UPS for my home computers. A pair of surplus 80A 6V Lambda switching power supplies produces 12V for the inverter, and a deep cycle lead-acid battery floats on the 12V bus. The bus also provides power for all my radios.

Phil

>Editor-in-Chief printed in the magazine he (Wayne) published...

He is probably telling it pretty much straight. About 5 years ago, I interviewed with Wayne for the position of Editor in Chief of 73. You may remember when he advertised the position. The first thing that impressed me is how small 73 is. It and Digital Review share about 4000 sq ft of space. The next thing that impressed me was Wayne's absence. He writes his editorials at home and drops in for a few minutes once a week to drop off the copy. (Which is probably one reason the magazine is in such bad shape.)

The editor and publisher had almost complete autonomy. The continuation of this autonomy was a ground rule for my considering the interview. His editorial page was to be off-limits but the rest would be under my and the publisher's control. Unfortunately, the publisher at the time was Norm Strumburg (or something like that) and we had immediate bad chemistry. So I declined the offer. The prospect of a pay cut also entered into the picture.

Trying to deal with Wayne reminds me somewhat of the exercise of trying to nail jello to the wall. He's got a thousand thought processes going at once and none seem focused. Some thoughts are whacky, others are pretty good.

One thing I don't understand is why the ham community does not make him put up or shut up. He hollers repeatedly about the dearth of technical expertise in ham radio. So why don't some of the technical writers submit technical - really technical - articles for publication. His page rate is as good as any so it would be worth your effort. He SAYS he wants to publish technical articles so why don't we call his bluff? Perhaps 73 is a resource the technical community could tap.

>procedures are the correct ones.
>
Everyone has their own style. Here's what *I* do....(your mileage
may differ! :-)!

>- BT vs. periods for punctuation,
Actual periods ("didahdidahdidah") are preferred when transcribing
text (from a book, article, etc); BT is preferred in general
conversation.

>- one or two BT's at a time,
Generally, only one BT is needed, although during
"breaks" in thought I'll send two or three BT's
(like saying "uh....uh....uh" during conversation?)

>- R R R vs. FB,
No real difference, I'm used to R R myself, so I use it.

>- R R R before or after the callsigns,
Again, I'm used to hearing "R R N6YMK DE W#XXX", so that's what
I usually do.

>- 559 vs 55N for the 2nd RST report,
"N" here is just a shorthand for "9". (By the way, with most of
the modern equipment out there, I have never sent/received/heard
an RST with anything but a "9" for 'tone quality'. Of course when
it comes to certain homebrew Soviet stations....)

>- differing amounts of abbreviations,
Most people use the abbreviations they've heard before; the
list provided in the "ARRL Handbook" and other ham radio
books is a good source of abbbreviations.

>- BK vs. BK TU vs. callsigns DE callsign KN,
This gets funny. I've heard "BK TU", "BK2U" (thought that was some
foreign call at first!) and all kinds of permutations of this. Whether
you use it or not is up to you.
However, I've always heard "W#XXX DE K#YYY KN" at the end of each
transmission. This alone should be sufficient in indicating that
it's your turn to transmit, making the "BK2U" business mentioned
earlier redundant.

>- when to use AR (I've only heard it used twice),
AR ("didahdidahdit") is normally used right after the end of your message, but before the W#XXX DE K#YYY KN. It is the end-of-message marker, and I use it instead of the "BK TU" constructions mentioned earlier. (It has the advantage of being much shorter than BK TU, etc.)

In formal message handling, the procedural signal AS ("didahdididit") is used at the beginning of each transmission; however I have *never* heard it outside of W1AW bulletins and the like; it's not used in informal QSO's.

>- leaving out one callsign and just send DE callsign,
Occasionally I've heard this; I've also heard stations sending the last three letters of the other station's callsign (e.g. MXR DE W6XUZ)....I know the FCC requires you to send your own callsign every 10 minutes; I'm not absolutely sure about the rules for sending the other station's callsign.

>- just ending with BK and no callsigns,
Bad form. AT LEAST send your own callsign at the end of each transmission.

>- SK before or after the closing callsign,
I think the form is "SK W6TTT DE N4WA"....but most hams know that SK means end of QSO anyway, so I don't think it's a real serious matter if you send "W6TTT DE N4WA SK".

>- the dit dit at the end of contacts.
I know about this....after the two hams have just signed off, one of them will send "dit didit dit dit", and the other will then send "dit dit". I don't know how long this has been going on, but I see nothing wrong with it, just a harmless bit of fun.

>
> Byte was started by Carl Helmers. [...]

Au Contraire, Weird Wayne was the original publisher of BYTE and Helmers was the Editor.
Then they had a fight/custody battle which Helmers won. Wayne went off in a corner and
threatened to start a magazine called "KILOBYTE" which after some legal action turned into
KILOBAUD. I susbscribed to KILOBYTE and received KILOBAUD for years -- it was to computer
magazines as 73 is to ham radio magazines (i.e. a good mag if you don't read the publisher's
column.)

I also subscribed to BYTE up until it became too uncomfortable to read it -- it would leave a
divot on your chest if you tried to read it while lying on the couch. I still have the first 24
issues of BYTE -- I keep hoping they'll be worth something someday. It was a different
world then.

4181. Antenna question

Newsgroup: rec.ham-radio
Date: 1990-07-12 13:29:30 UTC
From: perley@trub
Message-ID: <9675@crdgw1.crd.ge.com>
Source record: 10295

I was planning on making the delta-v antenna described in the recent antenna issue of Ham Radio (may 1990), and have a couple of questions.

Since this a high impedance (800 ohm) non-resonant antenna with a terminating resistor, is it safe to assume that the wire conductivity is less important than with a resonant antenna? I was hoping to use 14 guage steel fence wire (at ~1 cent/foot, plus I already have enough) rather than copper.

Second, what is the usual practice for enclosing the terminating resistor? Since it may have to dissipate up to 100 watts (not with my current rig), an airtight enclosure doesn't sound ideal. Per the article's suggestion, the termination will be 50 39 Kohm 2 watt resistors in parallel.

In a previous article, faunt@dustbin.cisco.com (Doug Faunt N6TQS 415-688-8269) writes:
>I would like to be able to run a standard PC/AT clone on 12V,
>efficiently. Where can I get information on buying or building a
>reasonably low cost power supply for this?
>thanx, and 73, doug

How about using straight voltage regulators in conjunction with those cheap
DC-DC voltage converters? Something like this:

```
+13.8V----------------[ +12V regulator ]------------------> to PC
|
|
-----------[ +5V regulator ]------------------> to PC
|
|
-----------[ -12V converter ]------------------> to PC
|
|
-----------[ -5V converter ]------------------> to PC
```

I'd think this would be a little more efficent than using an inverter feeding
another power supply.

I hope that K2EEK comments "Conversation with K2EEK, Editor CQ Magazine (Long)" doesn't really indicate that the "Homebrewer" or Innovative Ham is a thing of the past, but past experience has indicated we're a dieing breed!
The demise of HR and lack of good technical articles in QST, and yes QEX leaves me wondering if there's any method out there for exchanging technical ideas.

My impression of CQ and 73 Magazines is if thats what you want, buy it! QST seems to exist for the Advertiser and not the Amateur interest.

Are there any Hams out there who still tinker, design, build there own? Are there any Hams out there who write there own design, utility programs?
Are there any Hams who still know what Ohm's Law is and why we use the term Hz instead of Cycles?

Sure "homebrewing" is only one facet of Ham Radio, but to ignore the one aspect that nutured this endeavor from the beginning is short of sacrilegious!

So, if there is anyone still out there, please drop me a line at the QTH, I still like talking shop!

73's Chuck Reichert KD9JQ

Does any know if Kenwood is going to come out with a small dual bander, such as a TH-76, which would compete with the Yaseu 411 and Icom 24sAT?

I am looking for a 5W dual bander with cross band repeat capability and a receiver that can recieve the weather broadcasts at 162.5 MHz.

The reason for Kenwood is our family has four hams, 3 TH-25ATs, and one IC-02AT. When our youngest gets his license, I would like to get a dual bander and give him one of the 25ATs. Therefore, Whatever I get should be able to use all the TH-25AT accessories such as the rapid charger.

4187. Re: What is Phase Noise?

Newsgroup: rec.ham-radio

Message-ID: <1250194@hpnmdla.HP.COM>
Source record: 10288

I don't know if this is more detail than you want but the term
phase noise can get used to describe a whole class of random sources.

If v(t) = V cos[2 Pi F t + Delta(t)] represents a signal with linearly
growing phase component 2 Pi F t and a randomly fluctuating term
Delta(t) its possible to talk about either phase fluctuations or
freuency fluctuation and be talking about the same signal. We are dealing
with angular modulation.

Usually short and long term stabilities are separated. Long term gets
called drift or aging while short term variations get called phase noise.
Where you separate short/long term depends on your interest.

The way these effects appear in frequency domain, that is
the slope of their spectral density, result in some special names:

Name of noise Slope

Random walk F **-4
Flicker FM F **-3
Random Walk Phase (White FM) F **-2
Flicker Phase F **-1
White Noise F ** 0

For angular modulation only, the spectral display is symmetric about
the carrier (If it's not, then there is some amplitude component present too).
I think I got all this right, someone can correct me if I didn't.

I have had good success using Cu water pipe coaxial resonators at 400 MHz. 5/8" pipe for the inner conductor and 2" or so(whatever the common diameter available at plumbing supplies is) for the outer with a piece of 1/16" flashing at the bottom makes a good high Q line. RF connectors mounted on opposite sides of the outer conductor about 1" from the bottom with loops on them are fine for coupling. You will have to play with coupling loop sizes and positions to get an optimum compromise of insertion loss and operating Q.

I used the one I made (15 years ago I think) as part of an EME system to keep strong out of band signals from intermoding my receiver and raising the noise floor. As I remeber I got around .25 dB insertion loss and a perhaps 10 MHz of 3 dB bandwidth.

I think I still have it in the junk box at home if you need more details.

WD4OQC: submit technical - really technical - articles for publication [to 73].

I have, and they've been published. 73 periodically runs special
issues on packet radio with guest editors (first NK6K and then
WB6RQN). In the first I ran a fairly detailed discussion of higher
layer protocols, and in the second I reviewed the WA4DSY 56kb/s modem.
In both cases, my articles appeared almost exactly as I wrote them.

I came close to refusing to deal with 73 the second time around
because of their cynical attitude regarding the Maxcom ads, but I
figured that it wouldn't accomplish much. I was happy to get the
exposure in a mainstream amateur publication. I seriously doubt that
they would have been published in QST in as timely a fashion, if at
all, and I suspect that they would have been heavily edited.

>
>> - the dit dit at the end of contacts.
> Silliness... Shave-and-a-haircut, Two Bits. That's how it started, and
> has sort of degraded to just the dit-dit.
>

As you can guess, there are two places I disagree with Bob! First, the AR does serve a purpose. It's just like EOB in good old bisynch. If you lose your place copying the other guy's transmission, you are likely to pick out the AR and know that what comes next is your callsign, "de", and then his call-sign. Actually, I'm selfish on this point. I tend often to find a QSO in progress where the sending station sounds like he might be DX. Lots of times I go into automatic mode and do other things, like fill in QSL's. But I've got the brain programmed to scan the incoming stream for the AR, and then immediately take note of the two call signs.

The "dit dit" may have started out the way Bob described it, but it too serves a useful purpose. The final transmission from the other station may have had some info content besides the usual courtesy stuff. I send the "dit dit" to let him know I did copy it all and didn't just run off to grab another one while he was telling me how great the contact was, etc. I think it is superflous for the last station sending a real message to use it, but it is a courtesy statement from the receiving side.

Just another 2 cents worth.

...

>This is not voodoo electronics, this is the real world.

>Gary KE4ZV

I understand that theory and practice do not always coincide. "RF in the shack" can be caused by poor coax (typically a bad connection on the connector shield), poor shielding or other radiation from the transmitter AC leads, etc. In my experience, however, the problem is usually caused by common-mode currents on the outside of the coax shield caused by a problem in the antenna system such as unwanted coupling between antenna and coax (not run at right angles), a bad feedline connection, or inadequate decoupling of the coax shield at the antenna (the old "feeding a balanced antenna with unbalanced feedline" problem.)

Normally, feeding a half-wave dipole with coax (no balun) works reasonably well, because the quarter-wave half of the dipole connected to the shield presents a low impedance -- most of the return currents flow into the antenna instead of into the shield. However, if the length of the coax and other metallic conductors connected to it is such as to present a low impedance at the antenna (odd multiple of a quarter wavelength long), then substantial current will flow in the coax shield, possibly causing "RF in the shack", poor SWR and distortion of the radiation pattern. This problem can usually be corrected by connecting a balun between antenna & feedline.

If your microphone "bites" you whenever you transmit, then it seems to me you should correct the problem. Messing around with the grounds will often reduce or eliminate the symptom, but will not cure the disease -- the leakage or imbalance is still present, you have just changed the standing waves on your ground system to put a node at the operating position.

At legal amateur power levels, using properly shielded/filtered equipment, with good quality coax properly installed, you should not have an "RF grounding" problem. Properly grounding your station is important from a safety standpoint, but should not be necessary for proper operation of the equipment.

My understanding is that Wayne DID start Byte way back when. To save on
income taxes, he put it in his wife's name. When they divorced, she ended
up with the magazine, so Wayne started a new magazine called "Kilobyte".
She sued him for trademark infringrment and won. So he changed the
name to "Kilobaud Microcomputing" which lasted for a few years. I think
it is now defunct.

Wayne Green was the first publisher of Byte. It was a spin off
of the microcomputer articles in "73". He lost it through some
strange maneuver with a ex-wife or a tax dodge or the like.

He then started "Kilobyte" but didn't get trademark registry of the
name. Byte then started (Real Quick) a monthly cartoon called Killobyte
(or Kil O'byte), and the magazine had to change its name to "Kilobaud".

"Kilobaud" went through a name shift to become "Microcomputing". (They
got some strange letters from people describing the effort to get their
librarians to get a magazine called "Kill a Bod".) It lasted for 5 or 6
years before being folded into "80 Micro".

In addition to electrically altering the length of the elements with reactance, you could also physically alter the length with worm gears and sliding transmission-line-style traps(*). (I dunno the real name for the method, but I see them on the commercial tribanders by KLM, on my venerable Butternut HF6VX, et.al.). This approach could also apply to shifting boom length as well as element length.

Whatever you decide upon, I'm interested in hearing how you approach the problem. Now, who was that who said something about HF being a museum ?

one OF to another,

Perry Scott
KF0CA

(*) I think this thingy works by being a shorted 1/4 wave stub, which transforms to an open at the end of the 1/4 wave radiator. To switch bands, you change the length of the stub and its attachment to the driven element. I have some mechanical concerns about all this.

```
feed ====================+-----------------------+----/ arbitrary /---
| length
------------------------+
1/4 wave radiator 1/4 wave stub
```

4202. 2 meter quad construction plans

Newsgroup: rec.ham-radio
Date: 1990-07-12 22:07:13 UTC
From: rfc@briar.Philips.Com
Message-ID: <103634@philabs.Philips.Com>
Source record: 10299

copied from packet:
Msg# TSF Size #Rd Date Time From MsgID To
30164 BF 1246 2 08-Jul 0547 AA6MZ 3524_WA6PEZ QUAD@NYNET ()
Sb: Easy 2 Meter Quad

2 Meter, 4 Element Quad Antenna

This describes method for manufacturing a 4 element quad antenna from
easily obtainable materials. I have made this antenna and it works
great with and SWR below 1.2:1 across the entire 2 meter band.

This project should take about 3 hours to finish.

Material List

1. 8 each 3/8" wood Dowel
2. 1 each 8 foot long, 1 inch dia.
PVC Pipe, Heavy wall
3. 1 each 1 inch PVC TEE
4. 25 feet #14 or #16 gage solid
insulated wire
5. 1 each PL-259 Socket

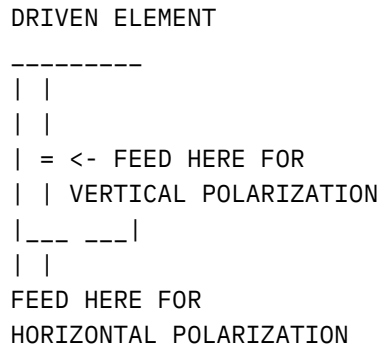
FROM CENTER OF REFLECTOR TO CENTER OF DRIVEN ELEMENT = 20.5 INCHES
FROM CENTER OF DRIVEN ELEMENT TO CENTER OF DIRECTOR 1 = 12 5/16 INCHES
FROM CENTER OF DIRECTOR 1 TO CENTER OF DIRECTOR 2 = 12 5/16 INCHES

CUT LENGTHS

ELEMENT WIRE LENGTH HOLE TO HOLE ON DOWEL *

REFLECTOR 86 1/8 INCH 30 1/8 INCH
DRIVEN EL. 81 15/16 INCH 28 5/16 INCH
DIRECTOR 1 77 15/16 27 1/4 INCH
DIRECTOR 2 74 INCH 25 7/8 INCH

* CUT DOWELS ABOUT 1 INCH LONGER THAN THESE LENGTHS.



After you have put your antenna together, solder the wires of each element (except the driven) end to end. Run the coax (RG58U is best) and secure with electricians tape. Solder the center of the coax onto one end of the driven element, and solder the shield onto the other end of the driven element. This project begs for creativity. See what you can do to improve this antenna (I made mine in small sections so I could put it into my trunk for portable operations). After you get it built, try it out on a T-hunt. A one sheet instruction sheet, with better information than I was able to pass on here, is available for an SASE to: Tom Shelton, AA6MZ 40672 178th Street East Lancaster, CA. 93535 Make sure you enclose a short note telling me what you want. Have fun with this antenna... 73 de Tom
AA6MZ @ WA6PEZ.CA

Pls write to him direct. WA2ISE
I haven't tried this, proceed at your own risk.

Larry,

I received my general radiotelephone license in August 1988. It required an application to the regional FCC office and taking the 100-question-multiple-guess exam. Incidentally, my license has no expiration date on it. Are you sure yours needs to be renewed? I was told mine was good for life.

I'll use this thread of rec.ham-radio to put a plug in for
Circuit Cellar. If you're still into hacking your own hw/sw
systems then check out Circuit Cellar magazine. Though it
definitely has a bent towards computerized embedded systems,
lets just say that it has the requisite number of schematics
in any issue to make a hardware hacker happy. The magazine
definitely has the early spirit of BYTE recreated in toto by
Steve Ciarcia & pals. They've convered some fringe RF/radio
weanie stuff like monitoring Soviet TV satellites and building
your own weather sat monitoring setup. The strangest thing
written about to date is the soda bottle rocket launcher :-)

You can subscribe to Circuit Cellar magazine by calling:

(203) 875-2199

Note that I have no association with these guys except that
I like their rag and will give it a plug whenever I see the
chance :-)

NK6K Provides MICROSAT Bulletin Board System (BBS) Status Report

Harold Price (NK6K) this week has provided the AMSAT News Service (ANS) with a complete run down on the MICROSAT Bulletin Board System (BBS) software (S/W) development effort. Working in close collaboration with Harold is Jeff Ward (K8KA) at the University of Surry (UoS) on the UO-14 BBS S/W. The following is a brief synopsis of the current progress.

It was decided early on to use UO-14 as a testbed for all MICROSAT BBS development. NK6K points out that there are several advantages to this. First off, all S/W devloped for UO-14 is completely portable to the MICROSATs due to a device programmers call high-level Application Programming Interfaces (API). The APIs hide the differences between the different computer architecture of the MICROSATs and UO-14. The APIs perform the "nitty-gritty" tasks that are peculiar to the hardware of a particular computer system. For example, one of the most common task performed by all computer systems is Input/Ouput (I/O) operations. Thus, to the programmer it makes little difference if the BBS S/W he is writing is for the MICROSATs or for the Packet Communication Experiment (PCE) on UO-14, as long as he uses the APIs.

Another advantage for using UO-14 as a testbed is the 9600 baud uplink/downlink that it uses. NK6K says that he can load new S/W in two passes as compared to eight passes for the MICROSATs. The MICROSATs use the much slower but more common 1200 baud. Also, UO-14 has a completely separate computer system for the PCE operations. The UO-14 On-board Computer (OBC) which controls the satellite is unaffected by what happens with the secondary PCE computer. So if the the BBS S/W crashes, UO-14 will continue to operate normally. If the BBS S/W causes a crash of the OBC on a MICROSAT, a great deal of S/W needs to be reloaded. Although an OBC crash doesn't put a MICROSAT at great risk, it is inconvenient to the users. Except for DOVE, most S/W reloads of a MICROSAT OBC are not very difficult to accomplish.

Lets go down the list of MICROSATs and give the present status for each one:

AO-16

AO-16 is in good shape. RAM memory tests will be done this week in preparation for uploading the BBS S/W. According to NK6K, at the present time, the BBS S/W for AO-16 is targeted to be installed and operational by August. Until that time digipeating operation will be possible.

DO-17

DOVE is still transmitting on S-Band only. Full recovery has been delayed due to an unexplained anomaly in the S-Band transmitter. N4HY has to rely on the S-Band transmitter because the 2M transmitter blocks the 2M receiver on DOVE.

This anomaly has required N4HY to use his considerable programming skills to write special Digital Signal Processing (DSP) S/W to work around this problem. Another problem plauging the DOVE recovery is that N4HY's hastily assembled S-band station is about 5 dB SNR lower than what is required for reliable reception. N4HY has, however, been able to use the high quality S-Band station of K0RZ in Boulder, Colorado via phone patch during mutually visible passes for software loading. N4HY has given the DOVE recovery top priority. At press time (Saturday July 7), DOVE had again crashed as evidenced by MBL transmissions from the S-Band beacon. Analysis was under way to determine whether the crash was due to a problem in one of the tricky software upload sessions or, less likely, another hardware problem. Two meter transmissions were not expected before Tuesday July 10.

WO-18

WO-18 is in good shape. The third version of the imaging S/W was uploaded last week. The Weber State University (WSU) engineers haved added more "tunning knobs" to the picture taking S/W in order to improve the contrast of the earth images. Addiditonal information has been added to the image header giving the solar array currents and horizon sensor values when the picture was snapped. These added items will provide more information about where the lens was pointed when the picture was taken. The impact detector, which was orginally designed to indicate when WO-18 was hit by micrometeorites, is being used to verify that the CCD camera iris shutter has clicked. When the shutter is snapped, the impact detector instantaneously sees the vibration that the shutter operations cause in the spacecraft structure.

Each day several images have been downloaded and those who have WeberWare 1.0 can turn the binary data into pictures on CRT screens. Finally, the 1.2 GHz Fast Scan TV receiver was tested and the horizontal sync was detected. A full image is expected to require more gain and/or much more accurate antenna pointing.

One good quality picture of earth features has finally been taken and will be transmitted every evening for the next several days so that WeberWare 1.0 users will be sure to have a chance to capture it. Other testing will continue during each day.

LO-19

LO-19 is in good shape. The RF power output of LO-19 is though to have been varying because of the simultaneous operation of the CW beacon. Once the RAM memory checking S/W has been finished and checked out on AO-16, the same RAM memory check will be performed on LO-19. Eventually the AMSAT-LU Group will take over all the S/W development for LO-19 after the BBS S/W is installed. At the present time all general housekeeping and monitoring tasks are performed by the AMSAT-LU team.

When listening to DX stations I've been hearing a seemingly standard phonetic alphabet, different from the published International Phonetic Alphabet. The letters that I've seen used are:

A America
G Germany
I Italy
J Japan
K Kilowatt
M Mexico
N Norway
R Radio
U United
W Washinton
Y Yokohama

Is this a defacto international standard? What are the words for the rest of the letters?

CW users: There are a bunch of new hams out here who have learned Morse code by listening to tapes and computer programs using the Farnsworth method. It sounds normal to me to hear code with 18-23 WPM characters spaced out to half that speed.

Can I transmit CW like that (Farnsworth), or do I need to relearn some real slow sounding characters to match my true send/receive speed?

Should have said old fart memory on; it is 31/91 :) :)

They have chased most of the people off of there nowadays; most got
tired of the b.s. and it sits quiet most of the time now.

4209. Callsign Server

Newsgroup: rec.ham-radio
Date: 1990-07-13 04:02:08 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9007130402.AA20268@tecnet1.jcte.jcs.mil>
Source record: 10235

I once had this information but have lost it (really dumb of me I know), but could anyone send me the IP number and socket for the callsign server, and is it still in existance?

Are there any OTHER servers "out there" that support other interesting functions that are "well kept secrets"?

Thanks for your time.

Mark Bitterlich
wa3jpy@wb4uou
mgb@tecnet1.jcte.jcs.mil

p.s. I am talking about an internet IP number and am not referring to the ampr servers. "You can't get there from here" :-)

>the people across the hall.
>
What happened with Popular Electronics , as well as Elementary
Electronics (remember that one?), was that they became general
interest computer magazines during the time when the "home"
computers (Atari 400/800, TI 99/4, Vic 20, Timex-Sinclair)
were very popular. With the advent of the IBM PC clones, the
home computers became less popular, and many, if not all of the
magazines which covered four or five different machines went
out of business.

It's true that Modern Electronics was formed from some of the old
Popular Electronics staff; it's also true that Popular Electronics
has returned in its original form--as a general electronics
magazine.

I have been reading Wayne for YEARS, and he is entertaining...but pretty off the wall. I have a large collection of ham magazines going back to long before I was born, and once in awhile I pick up an old CQ back from the 1950s when he was editor, and before that, when he was editor of the RTTY column in CQ.

He always acts like he is at the forefront of developing technology, when in fact he is pretty vague about the details. In the 1950s (and in later retrospectives) he acted like he invented RTTY....same is true for ham FM in the 70s. He talks about how he was a real inovator in ham microwave communications, when in fact I think he rounded up a couple of techie friends and did a little mountaintopping. Of course, years later the truth gets stretched a bit.

The funny thing is that even if you read the early RTTY columns from the 50s, it reads JUST LIKE one of his editorials today! It is hard to tell the difference. Sometimes I think the guy takes methamphetamine before he types.

Back in the mid-60s he formed this alternative to the ARRL, and it took in a fair ammount of money in memberships. They were going to be a lobbying organization, and he had all kinds of ideas about things they were going to do. Funny thing....it kinda faded away, and Wayne found less and less to write about it. Where did the money go?

About 10 years ago he wrote a couple of editorials about how he was going to start a fund for sending ham gear to developing third world nations. Of course, this was going to lead to all kinds of great things....like small African nations developing their on self-sufficient electronics industry from all of the resulting electronic talent. Wayne announced that from then on he was going to donate all of his fees from speaking engagements to this fund.... a most generous offer. Only thing is, I have never read about what happened to this fund or all of the speaking fees he has collected since then. Musta been a nice tax write off! There have been no details about his fund sending ham gear anywhere.

Lately he has been lambasting us for not using wideband digital voice instead of SSB on 20 meters. He has vague visions of some grand ISDN

on 20, yet this guy isn't even active on packet! Try doing a query
to the WP server for W2NSD.....he aint there!

Wayne is entertaining, and although his criticism of the league over
the years has been unfair, they probably needed a kick in the butt.
But it is hard to take this guy seriously!

Does anyone recall reading one of Wayne's editorials from the 1970s
when he traveled around the country and visited many of the small
computer companies springing up? His description of the early Apple
was quite interesting. He drove up to a suburban home, went to the
front door, and met a woman who said "the boys are out in the garage."
In the garage he found Jobs and Wozniak, putting together Apple I
kits! I think there were 3 people working there.

>
> I'm not aware of any hams in the early Apple staff. We had a veep a

Steve Wozniak mentioned awhile back that he got his ham license when he
was a teenager. He went on to bigger and better things!

> And we didn't get John Sculley (ex-ham) until just few years ago. So

I didn't know Sculley was an ex-ham! Was this when he was a teen?

Yes, Wayne DID start Byte. He started Kilobaud after his wife and the
editor of Byte took off with the magazine. He had it in his wife's name
because of tax problems. He started Baud after Byte, but was sued by
the new Byte, so he changed it to KILObaud.
>

> there any Hams out there who write there own design, utility programs?
> Are there any Hams who still know what Ohm's Law is and why we use the
term Hz
> instead of Cycles?

Are there hams out there who know the difference between "there" and
"their"? Are
there hams out there who also think that the reason we went from Cycles
to Hertz
was because we were afraid the common folk understood what Cycles meant?

If you find yourself bristling over the correction on grammar, now you
know what
hams who don't give a hoot about a soldering iron feel when they get
upbraided by
some self-inflated yutz who thinks anyone who doesn't like building
equipment is
dogmeat. There are many hobbies within this hobby -- each has a perfect right
to exist and none have the moral high ground over the other.

And yes, I've been designing/building electronic stuff since the early 70's.

> the filter configuration he suggested worked in almost all cases.

(lots more deleted)

At the extreme risk of showing my ignorance, I'm a bit curious as to what filter configuration helps cut down fundamental overload. I always thought fixing that required relocation of the rig, the TV, the antennas, or some combination thereof.

-In a previous article, faunt@dustbin.cisco.com (Doug Faunt N6TQS 415-688-8269) writes:
->I would like to be able to run a standard PC/AT clone on 12V,
->efficiently. Where can I get information on buying or building a
->reasonably low cost power supply for this?
->thanx, and 73, doug
-
-How about using straight voltage regulators in conjunction with those cheap
-DC-DC voltage converters? Something like this:
-
-+13.8V----------------[ +12V regulator ]------------------> to PC
- |
- |
- -----------[ +5V regulator ]------------------> to PC
- |
- |
- -----------[ -12V converter ]------------------> to PC
- |
- |
- -----------[ -5V converter ]------------------> to PC
-
-I'd think this would be a little more efficent than using an inverter feeding
-another power supply.
To make it much more efficient, use a down converter for the +5V.
The load for the negative voltages is low. You could generate a unregulated
negatieve voltage from the +5V converter and use 3 wire regulators for
the -12V and -5V.
Use a low drop PNP pass transistor in the +12V regulator.

Henk Peek, PA0HZP henkp@nikhef.nl

4221. DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 26/90 VOM 06.07.1990

Newsgroup: rec.ham-radio
Date: 1990-07-13 16:25:13 UTC
From: bpk@infoac.rmi.de
Message-ID: <884@infoac.rmi.de>
Source record: 10242
Cross-posted to: dnet.ham,rec.ham-radio

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 26/90 VOM 06.07.1990

TRIER:

Der langjaehrige Redakteur des DX-Rundspruchs Hans-Georg Goebel, DK1RV, hat das DX-Referat aus persoenlichen Gruenden gebeten, den DX-Rundspruch in neue Haende zu legen. Die deutschen DX-Amateure sind DK1RV zu grossem Dank verpflichtet fuer die zuverlaessige Gestaltung des DX-Rundspruchs in den vergangenen Jahren. Gleichzeitig teilt das DX-Referat mit, dass der DX-Rundspruch des DARC und des RSV ab sofort ueber die Station Y62DXR abgestrahlt wird. Redaktion und Bearbeitung liegen bei Ulf Ehrlich, Y42MK. Der Rundspruch wird wie bisher freitags um 17:00 UTC auf etwa 3.745 kHz abgestrahlt. Die zentrale Lage der Rundspruchstation in Thueringen garantiert optimale Empfangsmoeglichkeiten zu allen Jahreszeiten. Der Rundspruchredakteur wird in naechster Zeit ebenfalls mit dem DX-Packet-Cluster verbunden sein, so dass aktuelle Informationen direkt verarbeitet werden koennen.

DUISBURG:

Am 27.06.1990 fand vor dem Oberverwaltungsgericht Muenster die Verwaltungsrechtsberufungssache Gerd Kautz, DL5JP, gegen die Deutsche Bundespost Telekom statt. Seit 1985 verursachte der Klaeger in verschiedenen Empfangsanlagen seiner Nachbarn erhebliche Stoerungen. Messungen der Funkstoerungsmessstelle Duisburg ergaben, dass sowohl die mit FTZ-Nummer versehenen Empfangsanlagen der Nachbarn als auch die Geraetschaften des Funkamateurs in Ordnung waren. Gemaess Paragraph 16 Absatz 4 DV-AFuG wurde dem Funkamateur zur Auflage gemacht, eine Sendeleistung von maximal 10 Watt einzuhalten oder ausserhalb der ortsueblichen Fernsehsendezeiten Funkbetrieb durchzufuehren. Bei der Verhandlung im November 1988 vor dem Verwaltungsgericht Duesseldorf wurde vorgeschlagen, die Leistungsbeschraenkung von 10 Watt in 100 Watt abzuaendern. Das akzeptierte seinerzeit der Klaeger. Diese abgeaenderte Leistungsbeschraenkung war jedoch aus grundsaetzlichen Erwaegungen heraus nicht annehmbar. Im Berufungsprozess vor dem Oberverwaltungsgericht Muenster wurde neu verhandelt, ob derartige verfuegende Massnahmen ueberhaupt berechtigt seien. Dank der guten Argumentation des DARC-Justitiars Boyke Dettmers, DJ4KD, gegen diese Leistungsbeschraenkung hob die Deutsche Bundespost vor dem Senat des Oberverwaltungsgerichts in Muenster die Ordnungsverfuegung vom 17.12.1987 und den Widerspruchsbescheid vom

12.12.1989 komplett auf.

DARMSTADT:

Im ersten Halbjahr 1990 stieg die Zahl der Amateurfunklizenzen in der Bundesrepublik Deutschland um 840 auf 64.013, d. h. um 1,3 %. Die Verteilung der 61.024 Individuallizenzen blieb prozentual gleich, das heisst 54 % in der Klasse B, 3 % in der Klasse A und 43 % in der Klasse C. Club- und Relaisfunkstellen verzeichneten einen Zuwachs von 2 %. 1.164 zivile Auslaender stellen weiter 1,9 % der Individuallizenzen.

FRIEDRICHSHAFEN:

Vom 29.06. bis 01.07. fand in Friedrichshafen die 15. Ham Radio statt. Mit 16.429 Besuchern aus ueber 30 Laendern, 160 Direktausstellern aus neun Laendern sowie der erstmals grossen Beteiligung aus der DDR wurde eine neue Dimension dieser Ausstellung erreicht. Ueber 31 % der Gaeste kamen aus dem Ausland. Gleichzeitig mit der Ham Radio 90 beging der DARC als ideeller Traeger das 41. Bodenseetreffen. Neben zahlreichen Vortraegen und Treffen wurden vor allem die aktuellen Probleme des Amateurfunks in der Bundesrepublik diskutiert. So warnte der erste Vorsitzende des DARC, Guenther Matz, DJ8BN, in seiner Eroeffnungsrede davor, allein aus wirtschaftlichen Gesichtspunkten heraus das 70-cm-Band zu Gunsten anderer Bedarfstraeger zu beschneiden. Ebenso verfolge man, so DJ8BN, die Belegung der Sonderkanaele im Breitband-Kabelnetz der Deutschen Bundespost mit grosser Sorge. Die Ham Radio 1991 findet vom 28.-30.06. auf dem Friedrichshafener Messegelaende statt.

TOURS:

Im Rahmen einer Montblanc-Expedition im August soll eine Amateurfunkstation vom Gipfel des mit 4.810 m hoechsten Berges Europas betrieben werden. Die Expedition wird zwischen dem 10. und 20.08. 1990, abhaengig von der Wetterlage, aufbrechen und mindestens vier Tage, bei gutem Wetter zwei Tage laenger, dauern. Dabei ist ein 24stuendiges Biwak auf dem Gipfel vorgesehen. Unter dem Rufzeichen F8UFT werden die Operateure versuchen, mit moeglichst vielen Funkamateuren in Kontakt zu treten. Als Arbeitsfrequenzen sind vorgesehen: 144,100 MHz in CW, 144,330 MHz in SSB, 145,550 MHz in FM, 145,350 MHz via Relais FZ8VHB, 145,725 MHz via Relais HB9G, 438,500 MHz in ATV mit der Rueckruffrequenz 144,170 MHz in SSB und 144,150 MHz in FM. Ausserdem wird eine CW-Bake auf 144,050 MHz installiert. Vom Basislager gibt es aktuelle Informationen um 21:00 Uhr Ortszeit auf 3.610 kHz in SSB sowie um 21:30 Uhr Ortszeit auf 3.545 kHz in CW. QSL-Karten gehen via FD1JMH.

DOEBRIACH:

Vom 21.07.-12.08. findet in Doebriach am Millstaetter See in

Kaernten/Oesterreich das diesjaehrige DX-Camp statt. Obwohl das DX-Camp in erster Linie fuer Freunde des Kurzwellen- und UKW-Rundfunks gedacht ist, sind auch Funkamateure sehr willkommen. Vom 29.07.-03.08. stellt die ADXB-OE eine Amateurfunkstation fuer Kurzwelle und UKW mit dem Rufzeichen OE8XBC zur Verfuegung.

FUNKWETTERBERICHT: (03.07.)

Der ausgepraegte periodische Verlauf der Sonnenaktivitaet, der sich seit Jahresanfang herausgebildet hatte und der mit dem Monatsrhythmus zusammenfiel, scheint nun zu Ende zu gehen. Ursache war eine sehr ungleichmaessige Verteilung der Aktivitaetsgebiete auf der Sonne. Ob diese Umorientierung eine Erhoehung der Sonnentaetigkeit mit sich bringen wird, laesst sich zur Zeit noch nicht abschaetzen. Der Anstieg der Sonnenfleckenzahl und der 10-cm-Strahlung, der Ende Juni begonnen hatte, setzt sich weiter fort. Am 02.07. erreichte die Radiostrahlung 252 Einheiten. Wegen Verzoegerungen bei der Datenzustellung liegen keine aktuellen R-Werte hier vor. Jedoch duerfte Ende Juni nach der Skala von Boulder/Colorado die Grenze von 300 Einheiten ueberschritten worden sein. Die Magnetik war bisher ruhig, allerdings sind schnelle Aenderungen dieses Zustandes jederzeit moeglich. Infolgedessen muss im Vorhersagezeitraum mit sehr wechselhaftem Funkwetter gerechnet werden.

BAUNATAL:

Fuer den Deutschland-Rundspruch beginnt jetzt eine mehrwoechige Sommerpause. Der naechste Rundspruch wird am 24.08. herausgegeben. Allen Lesern wuenscht die Redaktion eine erholsame Urlaubszeit.

Ende des DL-RS Nr. 26/90 vom 06.07.1990

Bearbeitung: DC7XJ

Greetings!

I am posting this request on behalf of a friend who is an
office holder within a non-profit organization in the Washington D.C
area. Since he doesn't have access to Internet, I was cajoled into
posting this.

He wants to know, what it takes to setup a ham radio facility and any
info. or pointers on this matter (even better, any info./docs that
have a 'sort of' cookbook approach) will be much appreciated.

Since, I'm not subscribed to this forum, please send the info. via
e-mail directly to me and if sufficient interest warrants, then
I shall go ahead and post the summary to this group.

ADmany_thanksVANCE for any info. and/or help you may provide in this
regard.

W/ kindest regards,
/Ravi.

Yes. My very first encounter with Wayne was on a flight from Boston to Dayton way back in 1981 or so. He noticed my AMSAT name badge and he made some comment about how terrible it was that the FCC killed amateur satellites by taking all our frequencies away. Rather than challenge his basic assertion (since the amateur satellite service was and still is very much alive) I humored him by saying something like "Yeah, the FCC never did let us turn on the 2304 MHz beacon on Oscar 7."

Wayne then tried to tell me that the AO-7 beacon was on 1296. I knew better and politely tried to tell him so, but he insisted that he was right. I dropped the subject, but our brief conversation did illuminate certain facets of his personality to me.

nicholso@hpcuha.HP.COM (Ron Nicholson) says:

When listening to DX stations I've been hearing a seemingly standard
phonetic alphabet, different from the published International Phonetic
Alphabet. The letters that I've seen [sic] used are:

A America
G Germany
I Italy
J Japan
K Kilowatt
M Mexico
N Norway
R Radio
U United
W Washin[g]ton
Y Yokohama

I think most of these come from the earlier phonetic list that was in
use more than 20 years ago (at least, my G call in the mid-60s was
Germany 3 Norway Mexico Xray, whereas now it would be
Golf 3 November Mike Xray).

I don't think these are so bad to use - in fact, I have to think hard
whether I is now India or Italy, and whether U is Uniform or United.

In fact, I suggest that some of them are better than what we use now.
"Mike" is not nearly as clear as "Mexico" (I suppose the argument is
that there are only 2 single-syllable phonetics at the moment, and
there is rarely confusion between Mike and Golf). Our club call is
W5EHM, quite often if I use Whiskey 5 Echo Hotel Mexico (instead of
Mike), then someone who hears me only weakly will say "who's the
station with Mexico in the call?" Same thing (I think) with
Kilowatt as against Kilo. It also makes sense to use T = Tokyo
in the Japan DX contests :-) I believe H = Hotel is a bad one,
since in many countries the stress is on the second syllable, with
the H not even sounded. In some cases, Hotel can sound strangely
like Alpha - I listened to what I thought was a 9A station for a long
time (strong signal) before it dawned on me that it was 9H (the clues
were (1) there aren't any 9As, and (2) the guy said "on the island of
Malta" eventually :-)).

Anyway, the ones listed by the poster are in common use, and while the
purists may frown on them, they are a whole lot better than those "cute"

ones that, along with CB expressions, 10-10 numbers given in dollars and cents, callsigns "for ID" and other abominations drive many of us up the wall - or, in my case, back to the relative peace of CW :-)

4227. Re: HRO-500

Newsgroup: rec.ham-radio
Date: 1990-07-13 18:05:10 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9007131909.AA10539@ucsd.edu>
Source record: 10228

WOW! An HRO-500 for $150?!?!?! If it works OK, that will be a FANTASTIC buy!!!!

That was an over-$1500 rx back when a dollar bought something! (mid '60's, I do believe -- my references are at home....) It was a "dream receiver" that lots of SWLs and hams pined for and could only hope...

As I recall, it was National's second-to-last receiver; there was an HRO-600, but I don't know how it differed from the 500.

To bring things down to earth a bit, though, I do seem to recall that these were NOT easy to fix if anything was wrong. It may well be that this is sitting there for $150 because it requires impossible-to-find parts to fix, or has some nasty glitch that will require expertise to remedy, and the last expert in these retired 12 years or so ago...

The other thing to consider is that early high-end solid-state receivers tended to be more hype than substance. The digital readout was so snazzy to those of us that were used to drum-dial and disc-dial analog tube rxs, and the instant-on and "eternal life" of transistors vs. tubes was so enticing, that these features blinded us to the basic defects of that generation of solid-state electronics. It was like the early high-end transistorized hi-fi gear, which really sounded far worse than the tube gear people replaced with it. That generation of solid-state receivers had cross-modulation and dynamic range problems that were far worse than the mature tube-rx designs they replaced. I made the foolish mistake, back in '68 or thereabouts, of trading in my fine Hallicrafters SX-96 and paying full list ($895! sob!) for a Hy-Gain Galaxy R-530. That was a reciver you bought if you couldn't afford or justify the HRO-500 -- it didn't have actual digital frequency display, but it had a dial readout to 1 kHz accuracy. Sounds silly in these days of $50 DAK digital-display radios, but it was a big deal back then...

Be that as it may, I'd jump at the chance for an HRO-500 anyway. Even if it doesn't work, it still looks sexy in shack photos! Love that National HRO dial... (which is a mechanical nightmare inside, I believe... :-).

I seem to recall that the HRO-500 used nixie tube displays for the digital readout; am I right in that? Those do wear out; can you get replacements these days?

Regards, Will
wmartin@st-louis-emh2.army.mil OR wmartin@stl-06sima.army.mil

PS Please end your items with a simple mailing-address line like the above; the note I'm responding to on the SWL list had a garbaged "From:" field that equated to the "news" account on the originating system, it seems, and there was no poster-furnished address to use. WM

OOPS! I was a bit confused here. Must be getting old. Wayne started
KILOBYTE after Byte "moved out" of his offices. (He told me at a hamfest
once that he never knew that someone could "steal" a magazine). Lawyers
intervened, so he changed it to KILOBAUD.

AS means "stand by." I've *never* heard it at the beginning of a transmission
in a traffic net. I have only heard stations (NCS in particular) use it to
say "stand by".

>Jeff Miller WD6CQV/KH6 AFA8JM
>

"Fundamental overload" is the overload of a receiver's front end by a transmitter's intended (fundamental) output frequency. It is caused when the receiver's filters and shields are inadequate to prevent the receiver's front end from being overloaded by the transmitter's output power.

It should understood here that the transmitter is not operating on the same frequency that the receiver is intended to receive.

If the receiver is adequately shielded, fundamental overload can sometimes be helped by providing the receiver with better bandpass filters. That is, bandpass filters that strongly attenuate any frequencies that are outside of the receiver's intended frequency range.

The shielding on receivers intended for the mass consumer market is generally, ...well...cheap. Very few if any of the manufacturers intended for their receivers to be used in the near vicinity of transmitters. If they had, TVI and its cousins might be non-existant.

>When listening to DX stations I've been hearing a seemingly standard
>phonetic alphabet, different from the published International Phonetic
>Alphabet. The letters that I've seen used are:
[stuff deleted]

As far as I know, they aren't any sort of a standard. Some of them sort
of make sense because they are easier to pick out than the standard
phonetics, especially when a heavily-accented voice is saying them.
The ones that use geographic names are particularly useful. It's pretty
hard to make "America" sound like anything other than "America", regardless
of the accent. At least to me it is. Here's a slightly expanded list
of some of the more common ones I hear on a regular basis.

A America, Alaska, Atlantic N Nancy, Norway
B Boston, Baker O Ocean, Ontario
C Canada P Peter, Portugal, Portugal
D Dog, Denmark Q none that I can think of
E Edward, England R Radio, Russia
F Frank, Fox, Frequency S Santiago, Spain
G Germany, George T Texas, Tokyo
H Honolulu, Henry U Uncle, United
I Italy, Ida, Item V Victory
J Japan W Washington, William, Willy
K Kilowatt, Kentucky X none that I can think of
L Lincoln, London Y Yellow, Yokohama
M Mexico Z Zanzibar

Note that some of them (e.g. Frank, George, Ida, etc.) come from the public
safety standard. If you look at a full list of the public safety ones
(Adam, Boy, Charles, etc.) you'll notice that most of them are very
short - and many are American first names. I'm guessing that this
was done because most police/fire/rescue communications are done on
local FM frequencies where long phonetics are not needed to make
them more distinguisable. Plus the shorter ones take less time to say.

Personally, I prefer some of the "alternate" phonetics. I usually use
the standard phonetics, but if copy is real difficult and the standard
ones don't cut it the first time, I'll use some of the alternates
in the hope that they will be more recognizable to the receving station,
particularly when it's a DX contact with a person that seems to know
English as a second language.

"Blasting" the IRS is putting it lightly. In several of those
issues during the late 60's and early seventies, he
told all kinds of horror stories about alleged abuses by IRS
agents, etc. Also, Wayne also used a certain 7-letter word beginning
with "B" to refer to the IRS agents (and printed this word in the
magazine, which was considered unthinkable in those days)

Someone on the net mentioned that Wayne might have been convicted
for tax evasion. I have no way of knowing for sure, of course....

It has already been concluded that the code does NOT make a good weed-out
filter. Maybe we need one, but code won't do it.

> My suggestion is not a solution to the debate, but only someone
> who wants to voice his opinion about the discussion. What ever the results

Well, voicing opinions is definitely needed. One way you can do it is by
filing your comments with the FCC. By the way, it will more likely get read
and be taken seriously if you state logical and reasonable arguments based
on facts. Just expressing an opinion doesn't do too much; but if that is all
you have, go ahead and file it anyway.

Sorry, but Wayne <did> start Byte. He published the first several issues along with his wife Virginia, but their relationship soured and, because the mag was technically in her name (long story, there...) when she moved out she literally took it with her. She remained publisher until she sold to McGraw Hill in the early 80s.

Wayne founded Kilobaud after that, and in fact it was called Kilobyte at first until threats of legal action convinced him to change. KB lasted quite a bit more than a year (it was still going under the name Kilobaud Microcomputing in 1982), but I'm not sure when it folded.

I worked for Wayne Green, Inc. in 1981-82. It was a silly place.

4243. Ham Radio Magazine

Newsgroup: rec.ham-radio

I just got a call from Terry Northup, the editor of the now-defunct HAM RADIO magazine. She says:

(1) 3 of the articles in the July issue of CQ were in fact originally accepted by HAM RADIO;

(2) the HAM RADIO presence in CQ is going to increase considerably; there will be more technical items, and they will even go through the HAM RADIO editorial office in New Hampshire, which will remain open.

Hmmm, could we persuade 'em to start their magazine back up, before it dies out completely? It seems to be lingering...

In Sculley's (actually, written by John Byrne) book "Odyssey," he
mentioned not playing with toys (I guess, back then, there were no
Icoms, Kenwoods, and Yaesus :-) but instead he tinkered with
"electrical things." For Christmas, when he was 5, he was given
"a dry-cell battery, a buzzer and hook-up wire; and he proceeded to
blow fuses in his parents' apartment. He would read _The Radio
Amateur's Handbook_ until they were "shopworn and dogeared." He
became a Ham at 11.

So, Tad, I guess Sculley got his ticket *before* his teens :-) :-).

> Antenna coupler...model AC-1
> VFO..............model VF-1
> Transmitter.......model AT-1

The AC-1 was either a pi-section or L (I forget which) matching unit between the AT-1 (a 30 to 50 watt transmitter) and a random length Hertz (inverted L) antenna. The VF-1 was a single tube (plus voltage regulator) variable frequency oscillator using the Clapp (series tuned Colpitts) circuit. I vaguely recall there was a receiver called the AR-1 (what else?).

The AT-1 was basically a crystal controled unit for Novices and you plugged the output of the VF-1 into the front panel crystal socked when you upgraded to General.

Simple, basic starter equipment for beginners of a sort (and cost) that sadly no longer exists.

Kok Chen answers this specific question in a later posting, but I'll just add for those who don't know that long before John started selling soft drinks, his field was electronics. And I don't mean marketing; I believe he holds some patents.

Patty

p.s. That story about Wayne Green visiting Steve and Steve in The Garage sounds awfully apochryphal. Can anyone (except Wayne) verify it?

> -----------[ -5V converter ]------------------> to PC
```

>I'd think this would be a little more efficent than using an inverter feeding
>another power supply.

That would be terribly inefficient unless switching regulators were used.
To equal a 200 watt PC power supply, the 5 volt supply must be able to
supply over 30 amps. 30 amps at 5 volts is 150 watts. But dumping
the excess power in a pass regulator involves (13.5-5) * 30 or 255 watts.
This is about 30% efficiency.

Most PCs don't fully load the power supply anymore so this is the worst
case scenario but it would be a poor idea to underrate this much.
Many disk drives and peripherals draw a LOT of inrush current.

Switchmode regulators are very easy to build and work well. However,
the cheapest and probably most reliable solution is to buy a small
inverter. Tripp-lite sells a small 200 watt unit for about $140.
The inverter will run an average PC and a monochrome monitor if the
PC is not too full of goodies.

The Tripp-Lite inverters work very well and are very reliable. I have
a 1 kw unit here that is the centerpiece of my homemade UPS.

Piles of stuff deleted.

Back in the old days when men were men and aeroplanes had propellers, every nation had its own phonetics. Each nation was proud of its phonetics and each service in each nation just to prove they were made of stern stuff had their own phonetics. This was so pilots with hairy chests would not be confused with effete ambulance drivers. Telephone operators each had their own national set of phonetics that each girl was proud to know and happy to impart to a frustrated caller.

But then Hitler lost the war and they took the propellers off planes. Someone found out that if you took the propellers away they went faster and further. This meant that planes could now fly to foreign lands and instead of dropping Dupont Chemicals encased in steel, they landed and people got out and wandered around looking for honest cab drivers.

This if course caused much confusion with air traffic controllers. They now had to be nice to people who were a few years earlier shooting at them. So instead of all planes being "George Able ..." They now had funny foreign planes with foreign pilots to deal with. Much confusion here. So the ICAO (International Civil Aviation Organisation) formed a committee to draft some international phonetics. Some that all countries could use. They chose words that were common to most languages. Hence Tango, Delta, Golf, Hotel etc. They left out some other international words like Girl, Bar, Sexy, Taxi and Dollar. But maybe they didn't want to offend the air hostesses.

These phonetics were such a success that they were soon adopted by NATO. Some countries refer to these phonetics as "NATO Code". NATO of course had a similar problem. People who spoke different languages and used to shoot at each other now needed to communicate over radios and telephones. The telephone people liked it too as international calls were becoming more common. Large 50 circuit undersea cables were being installed and operators now had to put up with all sorts of shifty

foreigners making phone calls. So the ITU, adopted these phonetics as did CCITT and CCIR.

So now they are the correct phonetics to use anywhere in the free world and are pretty much understood in the unfree parts too. Of course there were provincial police departments, phone companies etc who considered the ICAO code to be part of the Metric system conspiracy and stuck to the old way. Then some people have never figured out why anyone would want to use phonetics and make 'em up as they go along. If you do make them up, it is essential that you never use the same word twice, as may lead to improved understanding.

So simply, if you want a hotel clerk in Adis Abeba to get your name right use the phonetics he probably learned at school. They much better than shouting and using the phonetics the good ol' boys in the sheriffs dept use.

From: msw1633@rigel.tamu.edu
Message-ID: <6573@helios.TAMU.EDU>
Source record: 10255

I thought that the idea of the communicator class license was to increase the numbers of operators in the Amateur Service (pse note that I hesitate to refer to the putative communicator licensee as a HAM). The Amateur Radio Service , I believe, would be stronger having greater numbers and would be less likely to lose anymore bands or subbands etc... I personally would never have dreamed of getting such a license.

Also, I am new to both HAM radio (having just passed my exams for Novice) as well as to posting to this news server (correct term?) I would appreciate any hints on how to post more effectively and also any suggestions for a brand new HAM who is incredibly short on cash all the time and really can't afford all the gear and such.

TNX 73 DE MARK WHITSITT (still awaiting his operator license and call sign.)

RTTY DX Notes, 1of3, 7/13/90

RTTY DX Notes for Weekending 13th June 1990.
Part 1 of 3.
BID: $RTDX0713

Confusion reigns. From reports received, it would appear that some
bulletin boards are adding their own endings to the BID, such as OC.,
AU., AUSNET., ASIANET., EURONET ETC. May i assure you that most of
these additions are occurring because of non-standard headings used by
a number of BBS's and are not the fault of the originator of the DX
notes. Maybe we will come to some agreement on traffic handling soon.
Who knows?

Information was supplied this week by I5FLN, I5ICY, I5IGQ, JA1BLV,
OD5NG, TG9VT, W2JGR and the Tri-State DX Association VHF packet
cluster. Thank you all for your news and views.

SB RTTYDX @ ALLUSA $RTDX0715
RTTY DX Notes, 3of3, 7/13/90

RTTY DX Notes for Weekending 13th June 1990.
Part 3 of 3.
BID: $RTDX0715

VQ9RB (formerly S79D) requests cards via WA4DPU, or otherwise you might try Dick Barnes, c/o Ford Aerospace Corp, NAV SUPPFAC, Box 55 FPO San Francisco, CA 96685-2000 USA.

UA4WGW cards go via Box 3113, Izhevsk 426006 USSR.

VK9LI says to QSL via VK2SG. Cards have been printed and should be in the post in a week or so, we hope.

Notes Of Interest:

UT5RP, Dima, has his IC720 repaired and is now on AMTOR ARQ and is looking for contacts. He may be the first Russian station to use that mode.

VQ9RB is Diego Garcia on Chagos Islands. He will be there for some time, and should be very active.

UZ3AXJ is a Russian bulletin board station, which is new for the Russians. This may be the first BBS from the USSR. At the moment he is beaconing.

The HK0 station is on San Andres, not Malpelo Island.

6W6JX will be active from C53, signing C53/6W6JX from August 9th to 23rd.

Now for the bad news. Ron, ZL1AMO, who has helped a lot of people obtain some of the rare South Pacific islands, proceeded to the Solomon Islands to operate from there, but unfortunately his equipment has disappeared somewhere along the way. Ron is asking for assistance to acquire new gear. If anyone is willing to help Ron, contact him at his home address.

GL DE DX1 (VK2SG) AT TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

* SpaceNews 16-Jul-90 *

=========
SpaceNews
=========

MONDAY JULY 16, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* CRRES INFO *
==============
The launch of the Combined Release and Radiation Effects Satellite (CRRES)
is scheduled for no earlier than July 17, 1990, at 3:31 PM EDT (1941 UTC).
CRRES will be placed into a highly elliptical, geosynchronous transfer orbit
of approximately 217 by 22,236 miles and will conduct complex scientific
research in the space environment just above the earth's atmosphere,
including the ionosphere and magnetosphere.

CRRES will carry 24 cannisters of various chemicals into orbit and release
them over time. When released, the chemicals will be ionized by the Sun's
ultraviolet light creating large luminous clouds that will elongate along
the Earth's magnetic field lines, briefly "painting" these invisible
structures. The mission will be complemented by 10 sounding rockets to
perform releases that require precise targeting of location, local time and
altitude. Six rockets are to be launched from Puerto Rico and four from
Kwajalein, Marshall Islands.

* MICROSAT NEWS *
==================
AMSAT-OSCAR-16 is doing well and is due to receive a RAM test and BBS
software that will become operational by next month. DOVE-OSCAR-17
suffered an apparent on-board computer (OBC) crash shortly after coming
back to life on VHF. The cause of the crash is being investigated.
WEBER-OSCAR-18 recently received the third version of CCD color imaging
software. Each day, several Earth images are transmitted by WO-18 and
may be viewed on computers running WeberWare 1.0 software. LUSAT-OSCAR-19
is also doing well and is due to have a RAM test performed shortly.

* HUBBLE TROUBLE *
==================
Evidence now strongly suggests that the Hubble Space Telescope primary
mirror is at fault, having about 0.5 RMS wavelength of spherical aberration.

The radii of curvature is correct, but there is a 1% error in the eccentricity of the perboloid. The aberration is not correctable by either using primary mirror actuators or by replacing the secondary mirror in orbit. The primary mirror actuators consist of two rings of twelve force actuators capable of 10 pounds of force each. They are located at 0.5 and 0.87 radii at the nodes in the spherical aberration curve. The actuators will not be used to correct for the aberration because it will deform the mirror into an even more complex shape. The final focus alignment is to be completed today.

The HST mirror problem is believed to have been caused by a "low-tech" error, such as mistyping the mirror dimensions into the mirror grinding computer, or using a mislabelled null-corrector when testing the mirror.

* WALL HISTORY *
================
SpaceNews orginates from Wall Township, in central New Jersey, USA. It was from Wall Township that Guglielmo Marconi's 1913 American Wireless Company transmitted the first transoceanic radio signals from a group of radio towers located along Shark River. On January 10, 1946, the US Signal Corps bounced the first radar signals off the moon and back to Earth. The dish antenna still stands on Marconi Road. Wall Township is also the home town of Apollo astronaut Russell L. Schweickart, who performed a spacewalk in March 1969 during the Apollo 9 space mission.

Subject: Communicator Class

>> As for testing, Communicator make code free. Same with Novice.
>> If they are serious about getting into it more into ham, they should make
>> 5 wpm code under Tech. class. The more you get into the hobby, the more
>> problems you will get with undesirables satisticly. This may weed out
>> those not really serious about the service/hobby.

ux1.cso.uiuc.edu!ux1.cso.uiuc.edu!phil@ucsd.edu (Phil Howard, KA9WGN) replies:

>It has already been concluded that the code does NOT make a good weed-out
>filter. Maybe we need one, but code won't do it.

Whoa! Wait a minute! The issue of how good or how bad a "filter" CW is for Amateur Radio was debated long and hard for months! It got really hot there for awhile on this subject... however nothing was ever "CONCLUDED". You may have believed that one side or the other WON the argument, or you might have happened to agree that your point of view was espoused most heavily, but the issue was NEVER "concluded". To use that word means that all (or even most) parties agreed to that viewpoint, and such was definitely not the case.

In addition, it is IMPOSSIBLE to judge a bandpass filter by looking at what got through and never knowing what was KEPT OUT!

People can complain about CW, they can flame those that feel there is a need for a "filter" at all, and they can argue the pro's and con's till the Sun burns out, but in my humble opinion... you will never be able to convince me that learning Morse Code doesn't demonstrate a desire to WORK towards a goal, and I am a strong believer in the adage that the more that you work for something, the more you will value it.

Is it perfect? No. (Obviously far from it)
Is it also keeping out a lot of potentially good hams? Maybe.
Is it also keeping out a lot of potentially bad hams? Maybe.
Do people that work harder for a ham license tend to respect it more? Yes.

Does the CW requirement make a good weed-out filter? I don't think that we will ever really know for sure.

Ok.. so I seem to be supporting CW.. not really. I would like to see a WRITTEN test that was about 50 times harder than the one currently in existence... or maybe a better way of saying it would be: Have a test that really requires one to demonstrate KNOWLEDGE of what one is supposed to know to begin with. No more multiple guess questions... maybe even (heavens forbid) a PRACTICAL! Hard to implement? You betcha.. but worth it.

4253. Re: Communicator Class

Newsgroup: rec.ham-radio
Date: 1990-07-15 05:07:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500594@ux1.cso.uiuc.edu>
Source record: 10261

Ham radio needs more people on the VHF, UHF, and SHF bands. I think most all of us agree we need FEWER hams on the HF bands. Quality instead of quantity is the buzzword for ALL frequencies.

Sure, we do need more technically oriented people. I also think of people who are interested in public service aspects of ham radio as being technically oriented. They just happen to be in ways some of us might not think applies to ham radio, but it sure does.

There is a way to deal with the diversity in technical interests.
The exam can be arranged in parts:
1. Rules and regulations
2. Basic operating procedures
3. Basic electrical theory
4. Basic radio theory
5. Electrical, radio, and site safety
What I would like to see is that it be required to pass EACH of the above sections separately. If you fail ONE, you don't get the license. That will help prevent someone who is super bright in one area to skip another. The electrical engineer Ph.D. is going to have to learn the rules and regulations.

Now to the above 5 parts we add one more part that must also be passed, but it can be CHOSEN from one of the following:
6a. Basic Morse Code (at some speed)
6b. Signal and information theory (FFT's FIR's)
6c. Computers and networking (programming, TCP/IP)
6d. Advanced operating skills
6e. Advanced UHF and microwave theory

This allows us to require the basic essentials all hams need, and also encourages competency in a chosen area of specialization. If you pass 6a you also get on HF. If you pass at least THREE of the special areas, maybe there can be an advanced class of license.

Also, the part on Rules and Regulations needs to emphasis a working understanding of the rules, not memorization. Rules changes, and one who memorizes them now will be out of place in the future. So the idea I have for this is OPEN BOOK. That's right, while you take the test on the rules and regulations, you will have access to reading a copy of the rules and regulations. The questions will be designed knowing that you are reading the rules, so they won't be that easy. They will test you ability to figure out the rules. For instance, is an ATV repeater using AM or FM and a modulating video signal up to 4 Mhz legal? Can you say "sidebands in the 435-438 range"?

Gee, I have seen alot of postings where people bitch about learning the code to get a ticket. It makes me think back to when I went to night school to get my ticket when I was eleven. The instructor was Bob Schoeing, W0BE, and he had the whole class doing code in 7 days ! (!!!!). It worked on phoenetics. I have lost the entire alphabet, and would like to get it, since I have bragged to a few people that I will have them pass the code test in 2 weeks (like Bob had us do). If you know what this is, you might have the whole alphabet - PLEASE send it to me:

L Liberia
O Old Crow Booze
H Hit it a bit
A about
V victory vee
B badminton set

Thats all I remember - Bob had the whole class doing 3 WPM after 2 classes with this system, including numbers and punctuation. (I was shocked)

If you can complete the list or have a different one, PLEASE get it to me somehow. It would be greatly appreciated.

Thanks in advance !

Some QSLing help, please? E-mail appreciated, tnx!

I'm trying to QSL an old contact with N7DKX. Unfortunately, he's changed his call since the contact (N7DKX not listed in 90 CB). I sent a card to his 83 CB address (Cody, WY) but it was returned by the PO. Can someone help? Somewhere in a CB between 84-89 his new address/callsign change must be listed. I'm closing up my 5BWAS and WY contacts are so hard to come by. Help!

Also, could someone with the 90CB supplement give me a QSL route for ZB2JB? He's Not in the GO list.

Many tnx.

4256. Re: Fundamental Overload trap

Newsgroup: rec.ham-radio
Date: 1990-07-15 15:04:55 UTC
From: rfc@briar.Philips.Com
Message-ID: <103743@philabs.Philips.Com>
Source record: 10262

One way to reduce or eliminate fundamental overload on a TV is to try a stub trap on the antenna terminals. cut a piece of twinlead or coax 1/4 wavelength long (taking into account propagation factor of the twinlead or coax) of the amateur freq. Leave the far end open. You may need to fine tune trim it. This helped keep my packet 2m station out of the TV and VCR. (Using the same mast for the 2m and TV antennas probably didnt help).

hope this helps 73 de WA2ISE

4257. 2 meters (144Mhz band) and wet trees

Newsgroup: rec.ham-radio
Date: 1990-07-15 15:09:27 UTC
From: rfc@briar.Philips.Com
Message-ID: <103744@philabs.Philips.Com>
Source record: 10263
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.shortwave

Been having this problem with my packet setup: During the summer, during wet weather, my ability to get a reliable connection to my home BBS (KD6TH) gets bad. I used to use an antenna in the attic, but since replaced that with one mounted on a mast above the roof. That helped much. (the attic antenna was useless in all summer weather, though in other seasons it worked fine). The roof antenna works good in dry weather, but we had several days of rain here, and the quality went poor. Dry weather returned, and it got better. Question is: Is the attenuation of wet tree leaves significant at 145Mhz? Lot more than the same trees dry? And without leaves (ie, winter)? I thought this sort of thing was only significant up in the microwave freqs.

No, I don't think that water is getting into the coax (that wouldn't explain the attic antenna performance). Or maybe I'm at the point where a dB difference makes or breakes it. (2m FM packet).

I remember Tom Kneitel describing a similar system in one of his
magazines ("Popular Communications", "S9", etc.) Unfortunately
he did not give the entire alphabet but only two letters.
The letter "C" was associated with the phrase "Coca-Cola", while
the letter "Q" was described only as being "somewhat unprintable"
(he did not give the 'phonetic' equivalent for "Q")

This system was described as once being used in the U.S. military
to teach code. Maybe someone on here will be more familiar with it
than we are and can give us the whole alphabet.

With a system like this, the concept of a code-free licence may become
a moot point....

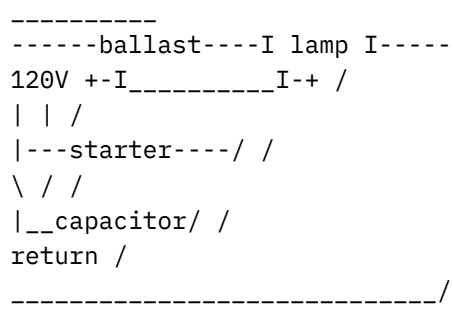
4259. florescent qrn reduction

Newsgroup: rec.ham-radio
Date: 1990-07-15 16:38:33 UTC
From: rfc@briar.Philips.Com
Message-ID: <103747@philabs.Philips.Com>
Source record: 10264
Cross-posted to: rec.radio.shortwave,rec.ham-radio

It's been asked what to do about florescent light noise. Here's one trick
that I found helps: (a pe-posting from 1/2 year ago)

Florescent RFI reduction
Here is something to try when confronted with RFI from a florescent
light. I found that connecting a 0.01 to 0.1 uF @ 1.4kV capacitor will help
reduce the RFI in most cases. Connect it like this:



The 2 pins on one end of the bulb are connected to a heater filament,
and likewise on the other end. You should connect the cap so that it
has to go thru one or both filaments before it reaches the ballast
and/or the return side of the power line. This will make the filaments
act like a fuse if the cap shorts out. Be sure to use a capacitor
rated at least 1.4KV. The starter makes a large inductive spike when
it starts the bulb. It's also a good idea to use high rated parts if
you install this cap in a fixture attached to the house, for safety
reasons. And be sure to make sure that, when installed, the leads of
the cap are well insulated and can't short to anything. For florescent
lights that don't have starters, you could try putting the cap across
the bulb like above. In this case, You'll have to depend on the
ballast itself to limit current if the cap shorts. Use a higher
voltage cap like 5KV in 2X40W fixtures. Just be sure that you don't
create a safety hazard when you do this! So, proceed with caution, at
your own risk. Near as I can tell, this has no effect on bulb life.

I do wish ham radio operators would break themselves of the silly delusions that ham radio is important in today's world and that FCC regulations are intended only to preserve the status exclusivity of those who are already licensed.

Hard, brutal truth #1: In today's world ham radio's only real value is as a National Park of the Mind - for recreation and learning.

Hard, brutal truth #2: Tough, exclusionary licensing processes do not contribute to truth #1.

Hard, brutal truth #3: Because of #1 and #2 above, present ham radio operators are the last people who should be listened to about the no-code petition.

Hard, brutal truth #4: The FCC is well aware of #3.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

DOVE RCVRY EFFORT CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 195.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

DOVE Software Reload & Recovery Effort Continues Despite Temporary Setback

On Sunday, July 8th at 02:30 UTC N4HY was able to successfully command DOVE back on 2M and, for a short time, the familiar ASCII telemetry was heard again. However, by the time DOVE reappeared over North America at around 05:00 UTC, it was evident that its on-board computer (OBC) had crashed. During the short time in which DOVE was sending telemetry, K0RZ copied several minutes of that telemetry which N4HY subsequently studied to evaluate the health of the spacecraft. From these first few frames of telemetry, N4HY declared that DOVE's batteries are in excellent condition with the bus voltage showing 10.9 volts. Also, the RAM memory appeared to be in good condition. Overall, DOVE has survived its four month hiatus very well.

In spite of this initial setback in returning DOVE to regular service, N4HY by no means given up or declared the task impossible. N4HY says that he plans to carefully study the several minutes of telemetry and the diagnostic memory "dumps" in order to discover the cause of the OBC crash. Keep in mind that this is the very first attempt to load software into DOVE using the "auditory" method, i.e., using the ear to tell when a packet stream has been successfully received and then manually sending the next packet group. N4HY further adds that he thinks one of the probable causes of the OBC crash this time was due to his thinking he heard an Acknowledge packet when in fact there was no ACK during the software loading process.

Stay tuned to AMSAT News Service (ANS) bulletins for further updates on the DOVE recovery effort.

AO-16 OBC RESET COMMANDED

HR AMSAT NEWS SERVICE BULLETIN 195.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

AO-16 On-Board Computer Reset For New Software

On July 12, 1990 at 01:17 UTC N4HY manually reset the AO-16 on-board computer (OBC). This reset was necessary so that new software updates could be loaded. These updates include improvements to the Whole Orbit Data (WOD) data collection routines. MICROSAT engineers were ready to make the changes

to these telemetry functions. AO-16 users should not be alarmed if they see no telemetry coming from AO-16 for the days following the reset. NK6K will load the new software as quickly as possible. N4HY wishes to stress that ALL IS WELL with AO-16 and this is a routine procedure to load new software.

AO-13 ORBIT DECAY ANALYSES

HR AMSAT NEWS SERVICE BULLETIN 195.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

Further Studies Continue To Examine AO-13 Orbital Decay

In the ever continuing analysis of AO-13's orbital decay situation, more work has been recently done by an orbital dynamics expert to characterize the nature of this problem more fully. Using a very large and detailed mathematical model of the earth's gravitational field and the perturbations to AO-13's orbit due to the sun and moon, the results show a mostly linear decay, but with a few wiggles, in the perigee altitude until 1992. At that point the perigee altitude will start to trend upwards until early 1994 when it will reach a peak. Then it turns around and the math model subsequently predicts that the perigee altitude will plunge to 200 KM by mid 1996. By late 1996 the math model shows that AO-13's perigee will reach 100 KM and eventual reentry into the earth's atmosphere.

HOWEVER, before all AO-13 users start to mourn the loss of this most popular OSCAR, keep in mind the old computer programming axiom, GIGO: "Garbage In, Garbage Out." At the present time this very large computer program used to generate these results is like a "black box." The analyst's answers are only as good as the assumptions that were used in building this computer program and the initial data available to work with. All AO-13 users are requested to keep this in mind when contemplating the impending reentry of AO-13.

ZRO TEST ROUND NOW COMPLETE

HR AMSAT NEWS SERVICE BULLETIN 195.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

WA5ZIB Reports Success in Recent ZRO Test Runs

The ZRO Tests in June went very well. More will be scheduled when AO-13 is again oriented for NADIR pointing. During the June 30th "JL" run time ran out for the "J" uplink before W6HDO could complete the test but the Mode "B" test went as planned.

Response to the ZRO Tests has been excellent. If you copied any of the June runs please send your results to WA5ZIB, Andy MacAllister, 14714 Knightsway Drive, Houston, TX 77083 U.S.A. A report will be returned after the numbers copied have been checked with the lists from WA5ZIB (mode "B") and W6HDO (mode "JL").

Due to the large volume of reports many certificate requests have been delayed. All replies will be in the mail by the end of July and a new schedule for the Fall will be announced as soon as AO-13's schedule for that period has been released.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 195.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC Time Phs Mode NCS U.S. Day

16 Jul 90 0115 130 B N5BF Sunday
27 Jul 90 0030 130 B N5BF Thursday
07 Aug 90 0130 170 J/L N5BF Monday
18 Aug 90 0045 170 J/L N5BF Friday

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your nearby AMSAT Regional Coordinator

SB ALL @ AMSAT $ANS-195.06
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 195.06 FROM AMSAT HQ
SILVER SPRING, MD JULY 14, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190
Mode-LS : MA 190 to MA 195 (Mode S Beacon only)
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 240
Off : MA 240 to MA 003
Omni Antennas : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:

BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

Not true. Because of earlier problems with the IRS, Wayne thought he would
be smart and put it in his wife's name. So when his wife AND his staff got
fed up with his antics, they just left with the magazine....no settlement
was needed, since NONE of it was in his name!

If I am transmitting at 14.2 Mhz, that is the fundamental frequency. If I install a Low Pass filter at the transmitter, this does nothing to attenuate the fundamental signal, but should keep the FCC off my back concerning harmonics above 30 MHz.

At the TV set, if I install a Hi Pass filter that attenuates signals below 50 MHz, then this attenuates the fundamental (14 MHz) signal and lessens fundamental overload.

You ought to read some of the trial transcripts for a good laugh. There
was a book published when he was running for Vice President of the United
States called "Run Wayne Run" detailing some of his more outrageous exploits.
They had some copies of the testmimony in his tax evasion trial. In it,
the judge was lambasting Wayne for lying to the court, and Wayne's response
was this rambling, self-pitying testimony about how all his life he had
suffered from an inferiority complex due to his small penis size!

I normally take anything Wayne says with a LARGE grain of salt, but this one (I think) is true. The reason I believe it is that Wayne published it back when Apple was one of a few garage operations around the country shipping kits....not later when they made it big.

You're right thought.....it does SOUND apochryphal!

As a new reader of this newsgroup, how does one access this fileserver.
I presume a message is sent to callbook@sat.datapoint.com, but how is
the message structured so that it interprets the query correctly?

4269. Dual-band comments wanted

Newsgroup: rec.ham-radio
Date: 1990-07-16 03:47:40 UTC
From: baxter@kuhub.cc.ukans.edu
Message-ID: <24965.26a0f28d@kuhub.cc.ukans.edu>
Source record: 10276

I'd like to solicit comments from current users of dual-bander radios (2meter/440) on their feelings about the model of radio they are using

I'm interested in anyone who may have tested the new Alinco 570, and what their opinion of the radio is.

Also, if anyone has compared the ICOM-2400 vs Kenwood's 731.

Any input would be appreciated.

4270. World Radiosport Team Championship

SB DXTEST @ ALLUSA $KT7H0716
Radiosport Test, pt. 1 of 2.

World Radiosport Team Championship
Bulletin ID: $KT7H0716
Part 1 of 2.

All beams will be on Seattle July 20-21st! The best of the best contesters will be competing in the first ever World Radiosport Team Championship. This will be a 10-hour sprint with lots of fun and action.

Join in and search out the 7-land/WG calls!

In cooperation with the 1990 Goodwill Games Cultural Exchange program, invited teams from around the world will compete in Seattle for the World Championship. There will be 22, 2-operator teams from 17 countries signing with special designator /WG (World Games). They will not be identifying their nationality, and they will all be running barefoot using identical Icom radios and similar antennas. All WRTC stations will be in the Seattle area. The local competition to be a host station was almost as intense as the contest itself!

This historic event will take place on July 20-21, 2100-0700 UTC. Modes will be CW and SSB on 80-40-20-15-10 meters. There are multiple categories, all CQWW rules. Work any station once per band/mode.

Continued in part 2.
/EX
SB DXTEST @ ALLUSA $KT7H0717
Radiosport Test, pt. 2 of 2.

World Radiosport Team Championship
Bulletin ID: $KT7H0717
Part 2 of 2.

Exchange RST and serial number starting with 001.
Points: 50 pts. each WRTC/WG each band/mode.
3 pts. different continent.
2 pts. same continent, different country.
2x pts each CW QSO.
Multipliers: US, VE, JA call areas, DXCC countries, WRTC stations.
Scoring: QSO points x multipliers = final score.

Prizes to be awarded will be gold, silver, and bronze medals, and plaques for the winning WRTC teams. Any contestant scoring in the top 500 will receive a WRTC T-shirt. You can get a certificate for 5 /WG

contacts, or a pin for 30 WRTC /WG contacts. Logs must be postmarked
by 8/20/90, to:

WRTC
4821 - 51st Ave. SW,
Seattle, WA 98116-4329
USA.

A video of the event will be shot. Watch for it in a few months!

This operating event is endorsed by the ARRL and the Soviet Radiosport
Federation. Sponsors include Icom, MFJ, US Tower, Ham Radio Outlet,
CQ magazine, Joe Mullen W3RLR, and other local suppliers.

I own a Kenwood TM-701A dual-band mobile radio and think it is great. The sensitivity and selectivity are excellent and the microprocessor control functions are fairly intuitive....Kenwood made use of a function key to keep the size of the radio down while providing lots of functionality. Some functions require you to hit the F key before the function and others require you to hold the F key down for two seconds and then select the function.

There is a modification available to make the 701 a cross-band simplex repeater.

The TM-701A is a cost-effective dual-bander when you compare its cost to the other alternatives (TM-731A and other brands, e.g. Icom, etc.).

Good luck /73

From: tom@ARO-EMH1.ARMY.MIL
Message-ID: <9007161140.AA08701@ucsd.edu>
Source record: 10177

I own both the Yaesu and the Icom, and much prefer the Yaesu.
It's only drawback is its lousy out-of-band receive sensitivity,
which (for me) is a non-issue. Size-wise they compare well: you
really need to carry the extra battery for the Icom. I prefer the
features of the Yaesu.
Tom, N9CGD

>The ones that use geographic names are particularly useful. It's pretty
>hard to make "America" sound like anything other than "America", regardless
>of the accent. At least to me it is. Here's a slightly expanded list
>of some of the more common ones I hear on a regular basis.

But the same isn't necessarily true if you are the person with the
heavy accent.

>F Frank, Fox, Frequency S Santiago, Spain

This is the line I was waiting for.
Spain is only valid to english speaking people. Others don't call it that.
In germany it is Espana (sp?) and when I lived over there I saw a few cases
of the pen moving faster than the thought processes. A person would say
"Washington 3 Norway Spain Italy" and the guy on the receiving end would
write, without realizing it, "W3NEI". Because people in the US learn so
little about their neighbors in the rest of the world, we tend to assume
they do everything the same as we do. Unfortunately (for us) they don't.
I can give you other examples but I hope by now you get the point. Using
anything other than legitimate standards for international communications
is just asking for a misunderstanding. Keep that in mind when you send in
your QSL for Albania and the QSL Manager says "sorry, your not in the logs."

As long as we're bringing up anecdotes about the founding fathers of the micro-computer revolution, here's my entry:

Does anyone remember the old Popular Electronics??
Does anyone remember their recepticle for anecdotes called "Just when I forgot my soldering iron!"
Does anyone remember that one of the entries was from Steve Wozniak!!

I don't remember the issue or the anecdote off hand, but if enough people call me a liar, I still have all of them and could probably find it if forced to. :-) :-)

Technician Class Elements 2,3a, 5 WPM - code
Communicator Class Elements 2,3a

No new Novice Class licenses would be issued although ALL current licenses must be grandfathered for current Novices not wishing to upgrade. It also must be noted here that any changes to a current class not effect the member of that class already licensed.

No re-allocation of privileges is proposed here for any class at this time.

The Communicator Class privileges are proposed as follows:

All current amateur privileges above 50 Mhz. As the only difference in this class .vs. the Technician is the code speed of 5 WPM I believe the privileges afforded the Communicator above 50 Mhz be the same.

ALL exams shall come under the direction of the current VEC system.

The exam for the Communicator Class shall have 30 questions derived from the current pool of elements 2 and 3a that would be applicable to the operation of stations in this class.

ALL current certificates of completion must still be honored until their expiration.

Call signs for the Communicator Class shall come from the current group D allocations.

3. The rationale for this proposal is that we can now offer the use of a codeless class of license to those who desire it. It would be now allow a single entry point into the service as well with the reduction of the code speed to 10 WPM from the current 13 WPM in the General Class an incentive for all to upgrade their current licenses.

4276. Re: Lat and Long listings?

Newsgroup: rec.ham-radio

Hi, all.

I need something that can provide accurate (but not down to
seconds) Lat and Long coordinates for a given city or area
.

Anyone have any suggestions (programs (MSDOS, pse.) text files)??

Thanks,

Lee

I realize that Spain is probably useless - in Spanish it's Espana. That
one is probably a bad example - I was just naming a few of the ones
I've heard, and said I preferred _some_of them, Spain definately not being
one of them. However, I have heard it used by DX stations in countries
where English is not customarily the common language. Why, I don't know.

By the way, already have a card from Albania ;-)

4278. Civil Air Patrol Information Transfer Alias

Newsgroup: rec.ham-radio
Date: 1990-07-16 14:16:30 UTC
From: aviator@athena.mit.edu
Message-ID: <1990Jul16.141630.25788@athena.mit.edu>
Source record: 10184
Cross-posted to: rec.aviation,misc.emerg-services,rec.ham-radio

Those of you that requested to be on the Civil Air Patrol mailing list should have received a test issue of CAPITAL - Civil Air Patrol Information Transfer Alias. If you are interested in being added to this mailing list, please send your name, rank, callsign, squadron name, charter no, squadron location, and preferred e-mail address to aviator@athena.mit.edu. If you are already on the mailing list, and do not want to receive the newsletter, send a request to the same address.

Submissions on any CAP topic are welcome. Once again, same address applies.

Could the following people submit improved e-mail addresses to me:

Brian Boyter boyter@fstc-chville.army.mil (Host unknown)
Jack Forman jjf@mid.epps.kodak.com (Host unknown)
Gerry Baumgartner gerry@ssd.csd.harris.com (Read error)
Ward Carpenter wardc@orieneb.uunet.uu.net (Host unknown)
Carl Chalek chalekc@crd.ge.com (User unknown)
Ken Gianino ken@swbtatl.uucp (Host unknown)
Dale Gunn dgunn@decwrl.dec.com (User unknown)
William Miner billm@hpmtlbm.lvld.hp.com (Service unavailable)
Michael Heil mheil@cupertin.portal.com (Unknown subdomain)

Any hints to reach these addresses from athena.mit.edu would be appreciated. I'll try as hard as possible to make sure everyone gets the newsletter.

Finally, if you have requested to be included on the mailing list, but did not receive CAPITAL, I'd like to hear from you.

My apologies for posting to three newsgroups - I expect everything to be set up and running smoothly soon.

...Joakim

Yes Rick:

We have been pursuing these launch opportunities since they were brought
up at a meeting in Marburg West (at the time ;-) Germany in April. Keep
bringing these things up though, sooner or later we are bound to miss
one ;-).

The callbook server on sat.datapoint.com is a mail server, installed for
those who (like me) do not have direct access to the Internet. Since I
recently posted the info, I won't post the entire help file. To get help,
send a message to "callbook@sat.datapoint.com" with the word "help" on a
single line. If you have any problems, just drop me a note!

> Transmitter.......model AT-1
>

I started in Ham Radio with an AT-1 in 1954. The AT-1 is a 6ag7
oscillator/buffer (it's a buffer when you use a VFO), a 6l6 final
amplifier which *doubles* in the final on most bands, with link
coupled output(fixed). The power output of the AT-1 is about 25
watts on a good day on 80 meters and about 5 watts on 10 meters.
You could plate modulate the AT-1 via an octal socket on the rear
apron of the chasis. The power supply was self-contained, with
a conventional transformer and 5u4 combination.
The VF-1 is a one-tube VFO that steals power from another octal
socket on the back of the AT-1 and plugs into the xtal socket using
one of those "300 ohm" twin lead plugs. It is basically identical to
the vfo in the DX-100 (remember the DX-100?).
I once used an AR-1, but never built one. It is a lousy receiver.
I remember a slide-rule dial and a circuit basically like a standard
5-tube AM broadcast set of the era. We actually did maintain communications
with this thing, but it was pretty crude.
I never saw or used an AC-1.

I may have a manual for the VF-1. I sold mine long ago but evidently
didn't supply the manual with it.

Geez! I guess memory *IS* the second thing to go! :-)))

Well, how about this- "Oh brrrrr. I remember when 146.94 was a SIMPLEX
frequency !"

Is that better? :-) (I still have the 94/94 xtals in my TR-22)

Losing bits at age 33,

4283. ?: RFI from a Hercules Card

Newsgroup: rec.ham-radio
Date: 1990-07-16 16:04:40 UTC
From: mwester@sunbird.central.sun.com
Message-ID: <350@texsun.Central.Sun.COM>
Source record: 10190

I just replaced my PC in the shack with an old original IBM PC... all is well, except the Hercules graphics card generates boatloads of crud on 147.555 Mhz. I rearranged the cards, shielded all the cables, and even put a ground-plane on the Hercules card. This dropped the RFI from S3 to S1 on the radio, better but not good enough.

Any suggestions? Can I shift the clock a bit? Any leads to filter? Or should I just buy a better-engineered card (any recommendations)?

Thanks
Mike (KA9WSB) Mike.Westerhof@Central.Sun.COM

4284. 1.6GHz receiving converter?

Newsgroup: rec.ham-radio
Date: 1990-07-16 16:55:04 UTC
From: paul@hpldola.HP.COM
Message-ID: <12120041@hpldola.HP.COM>
Source record: 10204

Can anyone think of a supplier for ~1.6GHz to "something reasonable"
receiving converters? I recall somebody sells 1.6GHz to 137MHz converters
for converting GEOS weather satellites down to NOAA frequencies. This is
targetted at a PRO2004 so most any output frequency between 25MHz and 1.3GHz
is fine.

When I bought my TH-26AT several months ago, I send a note off to Kenwood asking them if/when a TH-76AT model would be out. They did not reply [and I didn't think they would realy, but it was worth the letter], however they did send me a new products catalogs. Alas, the TH-75 was still there in the product line.

In article <336.26A09B83@w8grt.fidonet.org> jim.grubs@w8grt.fidonet.org (Jim Grubs) writes:
>
>Hard, brutal truth #1: In today's world ham radio's only real value is as a
>National Park of the Mind - for recreation and learning.

That will come as a considerable surprise to the six hams who are currently on the other side of that mountain over there (see that one? over to my left?) helping the California Department of Forestry with a fire. There are three additional hams at CDF's Morgan Hill regional HQ.

They're staffing the incident base and following CDF personnel around on foot and in trucks and copters. They're relaying crucial status reports and requests for equipment. They're using voice and packet. And if previous incidents are any guideline, they're probably providing inter-agency communications between CDF and other California emergency officials.

Amateur radio is indeed an excellent crucible for experimentation. And it's also a lot of fun. But anyone who thinks that's all it is can't have been paying very close attention.

>Scoring: QSO points x multipliers = final score.

Tad--

With all the interest being generated within the United States about
this contest (such as by packet messages like the ones you posted :-)),
it seems unfortunate that once a Seattle contest station has worked
each of the 10 U.S. call areas, no further stateside QSOs will count
for anything.

It seems to me that could cause the contesters to get frustrated at
having lots of strong U.S. signals calling them (or having to ask U.S.
stations to stand by) at the same time all the stateside hams think
they're helping the contesters by working them.

I guess it's too late to change the rules at this point, but it
seems like an unfortunate decision.

Patty

I don't believe there is a universally agreed upon Phonetic Alphabet but
many countries do require and/or test their amateurs for use of the
locally defined/approved Phonetic Alphabet. I know of Japan atleast
tests the hams, this is perhaps the main reason all the Japanese stations
use the same Phonetics.

As an aside, I wish the Japanese would use something different than
"Florida" for "F" in the DX contests (its virtually impossible to
understand Florida with their accent....)

Could someone post the full details on this book, i.e., author, publisher,
date of publication, etc? I'd really like to get a copy!

I've never seen it listed in 73 under the Uncle Wayne's Bookshop (or whatever
it's called) advertisement :-)

>A about
>V victory vee
>B badminton set

I had an uncle that taught me bits of the code using:

V - intro to Beethoven's 5th (??)
Q - intro to he comes the bride

Is this what you meant? Post it if you get the whole set,
even though I'm not a code person, it sounds interesting--
based on the way I learned the above two letters.

>name to "Kilobaud Microcomputing" which lasted for a few years. I think
>it is now defunct.

Among all the postings, that's one of the closest, but it's not quite
accurate. I should know. I was there!

Error: Virginia was NOT Wayne's wife at the time they started Byte.
Wayne and Virginia married in 1960, just after founding 73 in Brooklyn,
when Wayne was ca. 33 and Virginia 18 years old. They divorced around
1963, with Virginia taking custody of their daughter Tully (who was on
the cover of 73 last year, climibing a tower).

After a second divorce and then a while later, Virginia went to work
with Wayne again; this was around 1973-4. Wayne had lost a tax evasion
suit in '73, so when he and Virginia (who was essentially the business
manager of his whole operation) decided to start a computer hacker's
magazine, he put it in her name. They both did a lot of work to get it
to press in less than two months! The first issue was July, 1975; Carl
Helmers (who had put out a little newsletter called ECS) was editor.

Wayne and Carl had some disagreements. Carl wanted a more technical
journal for serious computerniks; Wayne wanted a more tutorial one for
novice hackers. Virginia sided with Carl and one Wednesday night, moved
the magazine out.

Carl didn't last much longer, but the whole story is best left to be
told in a novel, under thin cover of fiction. It's too unreal to pass
of otherwise.

BTW, Wayne added the "I/O" section to 73 shortly thereafter, and then
planned to start Kilobyte. (Read it as three words.) But he announced
the name too early, and Byte instantly added the comic strip
'Kilobyte(TM)', featuring the Scottish computer jockey Kilt O'Byte.
That clinched the trademark. Hence the mag became Kilobaud, thence
Kilobaud Microcomputing, thence Microcomputing, thence history.

One point I forgot in my other posting. When he started Kilobaud, he
put it in the name of Wayne Sanger Green Sr. That's his father, aka
The Ancient Aviator.

One of his anti-IRS tirades said that they saw his 1960's book,
"How to make a million dollars", and believed he must have done so.
Check it out -- it explains what he did in 1986, when he sold out.
(Summary: Start a business and sell out.)

I remember a note to the editor back in ~1972 +/- from Bill Gates who was complaining that due to the high piracy rate for the Basic compiler he had developed for the Altair 8800 that he had only made $2.00/hr for his effort.

Does anyone have the exact reference for that? I would love to get the real copy...

I'm studying to get my NOVICE ticket. I seem to be familiar enough now to send code, I'm just having a real rough time copying it.

Any help, such as the phoenetic system Jeff mentioned, would be great.

BTW, I have no problem with having to learn code to get a license and look forward to it being a challenging part of my new hobby.

Thanks,

Sandy

What?? I believe you get QSO points for EVERY QSO (1 for phone, 2 for CW,
more for DX or WG stations).

Your total QSO points are multiplied by the total number of multipliers
(total meaning total for the 10 hour contest) giving your final score.
If you accumulate 50 multipliers then every QSO is worth at
least 50 points.

At least, that's the way it has worked in most other contests.

I found where some other phonetic alphabet words came from.
Listed as Spanish Phonetics, on page 17-16 of "The ARRL Operating Manual",
1990 edition:

America Norvega
Brasil Ontario
Canada Portugal
Dinamarca Quito
Espana Roma
Francia Santiago
Grenada Toronto
Holanda Uniforme
Italia Victoria
Japon Washington
Kilowatio Xilofono
Lima Yucatan
Mejico Zelandia

BTW, although the Operating Manual seems to have lots of stuff on
DX awards and contesting; as a new ham, I found it very skimpy on basic
operating procedures.

> I'm posting this rather than mailing since I figure there must be other folk
> out there who would like the information. tnx

The callsign server on marvin is only available to sites on the Internet
through the telnet protocol. Any Internet user may connect by using telnet
to get to marvin.cs.buffalo.edu (128.205.32.4) port 2000. This is usually
done with the command "telnet 128.205.32.4 2000" but your milage may vary.

Once connected the session is interactive. You're given a prompt and help
is available to describe all the commands and features. You can make as
many queuries as you'd like and when you're done you just disconnect with
the "quit" command. There is no helper documentation besides the help
command. Everyone seems to find that satisfactory.

I have promised to add a mail based server, but I've been putting it off
since there is now one available on the net.

Devon

4303. HAM Fun and Mickey Mouse

Newsgroup: rec.ham-radio
Date: 1990-07-17 06:54:20 UTC
From: richard@hpfcdc.HP.COM
Message-ID: <7880184@hpfcdc.HP.COM>
Source record: 10200

Is ham radio fun? Yes, let me bore you with the details :-)
On Saturday morning I went to the Denver Radio Club's annual hamfest.
It's nice to be in a room full of people that share interests. Everyone
I met was friendly and willing to help me (a newcomer) understand the
various aspects of the hobby. After I got my call and name engraved on
a badge, people started talking to me by name. Friendly! I bought a few
goodies for my HT, and finding $40 left in my pocket (I'd been saving),
I stumbled on an MIT ALTAIR 680 computer. Hey, how can you pass-up a
computer that requires you to set address-switches. None of that
"keyboard" stuff for me :-) It even works. Love those LEDs.

Back at home in the afternoon, I'm programming my new hp48sx to talk
to my Kenwood 440's serial interface, (yea, the VISA is near meltdown),
when the Kenwwod scans past 28.450 and I hear this high-falsetto saying:

CQ CQ CQ calling all ham-radio operators, this is N6MM Mickey Mouse.

I've heard about mickey-mouse operators, but this was too much. It WAS
Mickey Mouse, and a DisneyLand Amateur Radio Club special event.
Needless to say, there was a lot of people trying. I tried twice but
was drownd-out by some big-rigs. I waited and waited, suddenly, as if
the band closed, everyone was gone except Mickey. (10-meter IS strange)
I got a clean QSO with Mickey and Cristy (the operator) and have sent
a QSL. I look forward to seeing their card.

Somehow, I wish I started doing this years ago.

> for anything.

... lots of stuff deleted along the way ...

The rules that I have, courtesy of Chod Harris and the DX Magazine,
say 1 point for QSOs with the same country. So, stateside QSOs will
still count. However, they will be able to work a million JAs, etc.
for three times as many points!

Looks like a pretty curious contest. I really don't have a clue as
to strategy for this one!

Anywho, good luck to everybody!

PC Globe is a little restricted in its listings, but works OK for capitols and
a few other cities in each country (I was annoyed that it didn't have Miami!).

RE: DSP Mania and books on the subject

Howdy:

Many people send me notes asking what DSP texts should be considered for an introduction. They always want the impossible however. One that is trivial to understand, does not require mathematics, and tells them how to write V.32 full duplex echo cancelling modems with the fastest Viterbi trellis decoder on the planet or does all the ham radio modes without operator intervention ;-). It should be clear that all these goals are contradictory (I don't want to say mutually exclusive even if I do personally believe this). I have two favorites, which show my bias towards modems.

Theory and Practice of Modem Design by John A.C. Bingham, Wiley-Interscience

and

Digital Communication by Edward Lee and ??? Messerschmidt.

(I can never remember Messerschmidt's first name or initial). I've forgotten the publisher and I left the book at home.

All the other applications that I need to do code for (speech encoders, FFT code, etc.) can be sewn together from the code given away by the chip/board manufacturers. There are no real practical `how to' books that give code examples to aid you in putting together modems that I know of with the single exception of a booklet put out by TI. The individual chip manufacturers run BBS's, have PD libraries with loads of source,etc. and TI has put out a booklet for a 300/1200 bps telephone modem. This booklet has source, little aid in putting it together as a working system, and almost no information on the criteria which went into the modem design. It also uses 1st generation DSP chip technology from TI and a major translation job is required. Motorola has given away source for a V.32 trellis Viterbi decoder for the DSP56001. Not included is the rest of the modem which includes the difficult equalization, near-far echo cancellation, and data aided carrier recovery for the `non-round' constellation. The technical discussion given with the V.32 trellis decoder is appallingly bad. Don't hope to understand what is being done on the basis of what is in this booklet. Having written these decoders for a number of projects (always before in a high level language) I became so confused that I decided to start from scratch, but it is there for the taking. I am certain that I am being thick and just didn't like the exposition. Maybe for you it will all be crystal clear. It can be gotten from any Motorola Semiconductor division outlet from their tech manual/ reference works library. Just walk in grab a plastic bag (paper sack if you are environmentally conscious) and walk out with more books than you can

carry. I am sure that TI does the same, I just haven't had the opportunity to do this yet. TAPR and AMSAT are working on DSP hardware for amateur radio modem use and will consist of a TMS320C25 plug in card with 85C30 for protocol work. There is code available from the TAPR AMSAT project available for anonymous ftp on tomcat.gsfc.nasa.gov. This code was written for the Delanco Spry TMS320C10 boards we were using at the time. I am sure it will be translated to the 320C25.

I hope this helps some.

>>He wanted a QSL, and asked if he should just send his "through the bureau".
>>I didn't know much what he was talking about, except that you needed
>>to be an ARRL member to get this service, so I said, "OK", and mailed
>>in my $25.
>Not true. You don't need to be a League member in order to receive
>QSLs mailed to you from other countries--only to send them out yourself
>through the ARRL bureau.

Well, it is ALMOST as bad - trying to send a DX QSL card out direct
is a very distinctly hit-and-miss operation as best. I get the idea,
from talking to and listening to, hams who do a lott of overseas DX
that direct mailing results in about a 50% or less response. Going
out through the bureau results in a much higher percentage if for
no other reason than the persons at both ends are in the "businesss"
fo dealing with QSL's (referring to bureau managers here). Thus, the
league, while saying "sure, you can send us xx bucks and we'll send
you anything we might happen to have for you" is turning around and
slapping you with the other hand and saying "but, you can't use our
service EVEN if you want to pay for it unless you are a member".

Which means, if you want to DX but you don't want to be an ARRL member
you are partly screwed as far as cards go. Since you need confirmation
to get an award like DXCC (and I suppose you have to be a memmber to
get that too......) you are in deep doo-doo if you are only getting
a 50% or less response!

4314. Re: World Radiosport Team Championship

Newsgroup: rec.ham-radio
Date: 1990-07-17 19:38:35 UTC
From: holly@hpcupt1.HP.COM
Message-ID: <7120127@hpcupt1.HP.COM>
Source record: 10138

From July 1990 CQ:

Multipliers are US, VE, and JA call areas. Multipliers count per band/mode.

Scoring: QSO points times multipliers.
credit 50 pts. for WRTC stations(signing /WG),
3 points for different continent
2 points for same continent/different country
1 point in same country
CW QSO's 2X QSO point multiplier.

As I read it, you can only get 31? multipliers per band times 5 bands (80-10)
for a total of 310 multipliers. This times the point score for QSO's plus
the credit for the /WG stations. You can only work a station once per band.
Therefore the /WG stations will be working more than one US station per
band/mode, but only the first counts for the multiplier.

4315. callsign servers sources available

Newsgroup: rec.ham-radio
Date: 1990-07-17 20:42:33 UTC
From: bowen@cs.Buffalo.EDU
Message-ID: <30912@eerie.acsu.Buffalo.EDU>
Source record: 10219

A number of people have asked me in the past for the sources to my callsign server and my standard answer has been that the code is really awful and I wanted to clean it up before sending it out. Well, that cleaning hasn't taken place and the queue keeps getting larger rather than smaller so I'm just going to make it available as is.

Anyone interested can ftp it from ftp.cs.buffalo.edu. It's in the pub/ham-radio directory. I'm willing to mail it out to anyone interested that's not on the Internet. You'll need compress and tar to unpack it. And it uses Berkeley style regular expression libraries. So you may need to tweak that to fit your own system.

Good luck and if you make any improvements or have any questions, please let me know.

Devon

Thanks, Chuck, and the others who responded...I told you I was risking
showing my ignorance!

I already realized that filters will help eliminate harmonics and in cases
where the receiver is well-shielded...guess I just jumped into the assumption
that all receivers are poorly shielded (seems that way, these days :-(:-( ).

>a 50% or less response!

I'd just like to clarify several points brought up here. Sending QSLs direct to DX stations shouldn't result in a lower return rate than for US hams, except for a few instances:

1. Sometimes local post office employees at the DX end pilfer the money or IRCs out of the envelope. Sometimes even the card! Especially if callsigns are used on the envelopes.

2. US Money or IRCs for sending QSLs don't necessarily work all over the world (though IRCs should, but not in the USSR).

3. South Americans are the poorest QSLers, IMHO. JAs are the best.

4. Some DXers stay out on expeditions for a long time and QSL when they get home. This results in delays. But delays are inevit- able through the bureau system.

5. Some DXers keep the money/IRCs you send them and return the QSLs via the bureau. If all you do is QSL direct and don't have envelopes on file, you won't get cards.

Yes, you do need to be an ARRL member to apply for DXCC. Yes, you can only send QSLs via the ARRL Outgoing QSL Bureau if you are a member. Yes, even if you work just a little DX, keep envelopes on file at your QSL bureau.

Hope this helps.

>use the same Phonetics.

There is indeed a "standard" phonetic alphabet. The "ICAO" (International Civil Aviation Organization) has enforced a standard one for years. It is the one that starts "ALPHA, BRAVO, CHARLIE, DELTA ..."

The ARRL used to have it's own phonetic alphabet back in the 50's (ABLE, BAKER, CHARLIE, DOG ...), but they switched over to ICAO in the interest of uniformity.

I agree with Ted. The mnemonic technique works fine for getting to
5wpm, but can be a barrier to getting above 13wpm. It's like you've
added one more level of indirection to getting from the sound to the
letter (or the word), and you take an extra hit in delay: ear ->
mnemonic -> letter -> fist. Once you've gotten used to hearing the
mnemonic, it's hard to get rid of it.

4321. Re: a question about crystals

Newsgroup: rec.ham-radio

"Parallel-resonant" crystals are identical to "series-resonant" crystals, but are specified differently. (A parallel-resonant 10 MHz crystal will be series-resonant at a lower frequency.)

With 15 pF to ground on one end of the crystal and 30 pf on the other end, total parallel capacitance is 10 pF plus circuit strays. I would specify 12 pF parallel C -- that should be close enough.

Nicely put. I agree.

> I personally would never have dreamed of getting [a Communicator
> license].

Why not? If it met your needs?

I've had my Tech for five busy weeks and read this group for about that long. It seems to me like a lot of people get caught up in the (relatively arbitrary) social structures and conventions of this hobby and forget about "reality". Such as: What do you enjoy about using the radio? What are your personal interests, goals, and exciters? What must you do to attain them?

I got into ham because I saw HTs in action (marine band) and wanted 2 meter privileges. Keeping that goal in mind has helped me focus my time and energy. (Alas, there are a lot of related "funs", I'm finding, like creating a personal 12V connector system for all my various toys, and exploring 10m HF, and checking into nets, and ...)

Do you mean a computer database, or a Global Positioning Satellite (GPS)
receiver?

If you want great data for any one state, at about $75/tape, contact the
US Geological Survey. Send me mail for details.

If you don't mind looking up and transcribing from paper, check the back
of various atlases at a library. In particular, I like Rand McNally's
"Earth and Man" for worldwide locations accurate to 1 minute.

I got the PB-2 apart. It was a big job and took a combination
of prying and cutting through the joints with a knife. If
you do it use a short bladed knife so you don't cut into the
cells. Glue was used liberally inside. Mine has 2 dead cells
(of seven). I ended up cutting all the seams. If possible,
there are two seams not to cut that would make it go back
together easier. Those are on the top of the pack and
run from front to halfway back on each side. They are the guides
that align the front and back and work like drawer guides.
I suspect they don't get glue applied.

RTTY DX Notes for Weekending 13th June 1990.
Part 1 of 3.
BID: $RTDX0713

Confusion reigns. From reports received, it would appear that some
bulletin boards are adding their own endings to the BID, such as OC.,
AU., AUSNET., ASIANET., EURONET ETC. May i assure you that most of
these additions are occurring because of non-standard headings used by
a number of BBS's and are not the fault of the originator of the DX
notes. Maybe we will come to some agreement on traffic handling soon.
Who knows?

Information was supplied this week by I5FLN, I5ICY, I5IGQ, JA1BLV,
OD5NG, TG9VT, W2JGR and the Tri-State DX Association VHF packet
cluster. Thank you all for your news and views.

SB RTTYDX @ ALLUSA $RTDX0715
RTTY DX Notes, 3of3, 7/13/90

RTTY DX Notes for Weekending 13th June 1990.
Part 3 of 3.
BID: $RTDX0715

VQ9RB (formerly S79D) requests cards via WA4DPU, or otherwise you might try Dick Barnes, c/o Ford Aerospace Corp, NAV SUPPFAC, Box 55 FPO San Francisco, CA 96685-2000 USA.

UA4WGW cards go via Box 3113, Izhevsk 426006 USSR.

VK9LI says to QSL via VK2SG. Cards have been printed and should be in the post in a week or so, we hope.

Notes Of Interest:

UT5RP, Dima, has his IC720 repaired and is now on AMTOR ARQ and is looking for contacts. He may be the first Russian station to use that mode.

VQ9RB is Diego Garcia on Chagos Islands. He will be there for some time, and should be very active.

UZ3AXJ is a Russian bulletin board station, which is new for the Russians. This may be the first BBS from the USSR. At the moment he is beaconing.

The HK0 station is on San Andres, not Malpelo Island.

6W6JX will be active from C53, signing C53/6W6JX from August 9th to 23rd.

Now for the bad news. Ron, ZL1AMO, who has helped a lot of people obtain some of the rare South Pacific islands, proceeded to the Solomon Islands to operate from there, but unfortunately his equipment has disappeared somewhere along the way. Ron is asking for assistance to acquire new gear. If anyone is willing to help Ron, contact him at his home address.

GL DE DX1 (VK2SG) AT TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Dave,

I was looking fondly through a September 1955 CQ Magazine and found those items advertised in the two-page Heathkit spread. Lessee... the AC-1 antenna coupler was to properly match your end-fed long wire antenna to your low power transmitter. It had a tapped inductor and variable "condenser" as well as a neon RF indicator and was good for up to 75 watts on 10 through 80 meters. Here's a scream: it sold for $14.50 in 1955!

The VF-1 VFO was a newly introduced model featuring 3 basic oscillator bands, but calibrated for 7 bands, 160 through 10 meters, including 11 meters. Used a 6AU6 in an electron-coupled Clapp oscillator circuit with an 0A2 voltage regulator tube. The price: $19.50.

The AT-1 was for 80 through 10 meters (including 11 meters, of course) and ran as much as 35 watts input. It used a 6AG7 oscillator-multiplier, a 6L6 amplifier-doubler, and a 5U4G rectifier. The price: $29.50.

In the same advertisement, Heath showed an AR-2 communications receiver (I assume it replaced the AR-1). This was a six-tube receiver covering 535 Kc. to 35 Mc. with an electrical bandspread scale "for tuning and logging convenience." It used a 12BE6 mixer-oscillator, 12BA6 IF amplifier, 12AV6 detector-AVC-audio, 12BA6 BFO, 12A6 beam power output tube for audio output, and the ever popular 5Y3GT rectifier. The price: $25.50. By the way, instead of metal it used a proxylin impregnated fabric cover plywood cabinet. Only cost $4.50 extra.

I love reading through these old magazines... I was two years
old when this was published. Still makes me an OF, though!

This was a great issue--announced the very first Worked All
Europe DX Contest. Had a substitute country list for USSR
Call areas. DL7 West Berlin substituted for Estonia, SM1
Gotland substituted for Lithuania, OZ Bornholm Island substituted
for Latvia, etc. Wonderful reading.

4332. direct vs bureau QSLing

Newsgroup: rec.ham-radio
Date: 1990-07-18 05:54:45 UTC
From: oo7@ut-emx.UUCP
Message-ID: <34233@ut-emx.UUCP>
Source record: 10134

Patty Winter N6BIS (winter@apple.com) says:

>>....And I'd like to hear from Derek, Tad, etc. about the
>>relative success of direct vs. buro QSLs. My impression is that
>>the former is more reliable.

I haven't done the statistics properly, but I get at least a 90% return rate sending cards direct (they can still take up to a year), and if I really want a card this is the way I go. I haven't checked my return rate using the bureau, it's much lower (about 30% probably). Basically, I send a card via the bureau if I'd like one in return but won't lose any sleep if I don't get it.

Bureau statistics are hard to calculate, really. If you work a contest and call CQ for a weekend, you will get a lot of cards asking for yours, from stations that you wouldn't have asked for a card - so I'm not sure how you count those in the statistics. I never harbor ill feelings towards anyone who doesn't reply to a bureau card, but I never forgive someone who doesn't reply when I send a card direct with $$ or IRCs :-)

Jim AD1C mentioned keeping a list of known "non-QSLers", I think that is a great idea. None of the DX mags seems to be brave enough to do it (and some cards don't come back for all sorts of reasons, not just the refusal of the DX station to do anything about it). I have exchanged such info with Jims AD1C and K6ZH, Patty and other Fine Usenetters, and would be happy to hear others' experiences.

One thing I do to encourage a reply is to put in a short note thanking the person for the QSO, and telling them why I would like a card ("first Albanian on 2 meters", or "I'm collecting calls that spell rude words", whatever). When I decided to be patriotic and get a W.A.S., I put in a note to each person explaining that this was why I wanted would like a card (of course, I sent an SASE too), and I think I got close to a 90% return rate on those domestic cards too.

While the bureau takes time, it's the only sane way to amass the cards you need for some awards, or just for friendly card exchanges. The cost of ARRL membership is worth it for the bureau facilities alone. Those fine folks who volunteer their time at the incoming bureaus deserve our thanks, too! And as they say, "QSL sure via buro" (right.......).

Can anyone help me out with any mods to the AOR 900 handheld scanner. It came with a little bit of paper saying that some frequencies were restricted for use in the USA, but I'm not operating it in the USA!

Anyway, is there an archive of all these radio mods anywhere?

4336. Radio on 24hrs a day/Reliability/DTMF Decoder/etc

Newsgroup: rec.ham-radio
Date: 1990-07-18 14:22:29 UTC
From: svec@motcid.UUCP
Message-ID: <4185@feldspar2.UUCP>
Source record: 10136

Myself & Don (WD9DMP) recently finished building a DTMF Decoder
squelch project. The intent is to put it on our 2 Meter Base Station
(Mobile or scanner) 24hrs a day to keep it quiet except when
obviously, the right tone sequence is sent to open the squelch.

Several sky-warn repeaters in the area seem to send out
a single 9-digit (I think it is a nine) at the start of nets
(either during bad weather or weekly nets)
(Is there any universal digit (eg. 9) used for such things as sky-warn?)

We were discussing what the general reliability impacts
are on a radio that is left on in receive all the time over the years?
Perhaps someone using a 2M Mobile as a remote repeater receiver has some
comments... I have a few choices of radio to put it on, the top 2 being
the preferred choices:
A Midland 13-505 2M crystal mobile
A Standard Horizon/2 2M Crystal mobile
A Kenwood 7730 synthesized mobile (low on my list since I would
rather sacrafice one of the two crystal radios)
A Bearcat BC210XL Scanner

Any comments or your experience in what tends to fail (if anything)
would be appreciated.

Well, this sounds like a good idea. Maybe if I put notes in with my cards,
I'll be able to improve my return rate from 65% to 90%. Wow, that's
impressive!

I just got a card from VK9TR yesterday (via VK5FG) which had a two sentence
note on the back thanking me for the QSO. It was a nice touch. I was
hoping it was going to be a sked for CW, which I asked Trevor about when I
worked him, but he couldn't oblige. Now with the automation of the weather
station, it looks like it might be a long time before I work Willis on CW
(should have asked VK9ZG when I worked him 10 years ago).

Hello readers...

I own a Yaesu FT470 VHF/UHF hand-held. It covers the European frequencies
144-146 & 430-440 MHz. I'd like to extend the coverage so that it can be
used on other frequencies if I go abroad (eg upto 148 MHz).
I know there are a number of mods available.
Has anyone got precise details ??

I assume you mean their contest for the best reason why the applicant should receive a free soldering iron. To this day I remember two of the winning entries. One wanted to solder a resistor to his kitchen stove. ("I always wanted to have an ohm on the range.") I think the other wanted to do something to his wife. She kept asking "Wire you insulate?" when he'd get home at night...

In article <350@texsun.Central.Sun.COM>, mwester@sunbird.central.sun.com writes:
>I just replaced my PC in the shack with an old original IBM PC... all is well,
>except the Hercules graphics card generates boatloads of crud on 147.555 Mhz.

Chances are, much of the RFI is coming out of your monitor. It could be that the reason the problem didn't start until you went to the Hercules card is because your earlier card operated on a somewhat different set of scan frequencies. The RFI was still there, but you didn't notice it because it was on another frequency.

The early IBM monochrome monitors (and especially their Korean clones) radiate lots of video all over the HF band. The first thing you should do is to isolate the source of the radiation. In my case, clearing the screen reduced the noise level considerably. This told me that video, not sync pulses or deflection oscillators, was the problem. Turning down the contrast control (essentially a video gain knob) also reduced the RFI considerably, but the brightness control (which controls DC bias on a CRT grid) had no effect. This told me that the radiation was coming from the video output stage, but not from the CRT beam itself. (The video output stage is just after the contrast control).

The +70V power lead that runs from the main PC board up to the video output stage on the base of the CRT turned out to be the big offender. I replaced it with a short section of RG-174 coax, grounded the shield to the main PC board ground and added a bypass cap on the load end. This took care of much of the noise, but some was still left. I then coated the inside of the cabinet with GC Nickel Print paint and added a power line filter. These didn't seem to do much. But then I added a coax braid sheath over the video cable from the PC and grounded it to the cabinets at both end. The remaining RFI virtually disappeared.

The fact that I didn't see any reduction when I added the paint and the AC line filter doesn't mean they didn't do any good; they might have been blocking RFI paths that were being swamped at the time by another, stronger source (e.g., the monitor drive cable.) What I recommend is that you start with the easy steps and work toward the harder ones until the RFI is down to an acceptable level.

The newer monitors, especially the better color monitors (e.g., my NEC Multisync 3D) are MUCH better for RFI. A look inside shows why: metal shields, ferrite beads, the works. The older monitors had essentially no RFI measures at all.

> Well, how about this- "Oh brrrrr. I remember when 146.94 was a SIMPLEX
> frequency !"
>
> Is that better? :-) (I still have the 94/94 xtals in my TR-22)

Better yet, check in on the 146.76 repeater in Jessup, Maryland
and ask Gary Hendrickson about the history of that repeater.

He'll proceed to tell you "This is one of the oldest repeaters
in the area...it used to be on 34/76 in the early days..."

Bet that caused some interesting problems when 34/94 turned on
in Baltimore, 10 miles up the road. :?

I see your point. This sounds to me like the rules for the CQWW DX
test, where you can get multipliers by working other USA stations for
zone credits. Once you have them, you don't need other domestic
stations. Of course, the difference here is that the official teams
are worth a lot more to everyone.

OOPS!

I just got off the phone with Homer Spence, K7RA who is on the committee.
He tells me that the teams operate under different rules than the
rest of us, since they are essentially only competing with each other.
I am not sure how many points the teams get for working USA stations,
but USA stations each get a point for working other USA stations.

I ignore them when they want a text without any math, because you can't really understand DSP without having a firm background in Fourier Transforms, Z Transforms, etc. I'd like to recommend the classic textbook "Digital Signal Processing" by Oppenheim and Schaffer. We didn't use this in my class, however; we used the book by Stanley, Dougherty, and Dougherty.

```
+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07 & 1.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition
```

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

4352. Airwave Wars

Newsgroup: rec.ham-radio
Date: 1990-07-18 21:52:48 UTC
From: karn@envy.bellcore.com
Message-ID: <1990Jul18.215248.11497@bellcore-2.bellcore.com>
Source record: 10164

Be sure to see the cover story "AIRWAVE WARS" on the July 23, 1990 Business week. The article begins by describing the UPS/ARRL battle over 220 MHz.

Among the interesting tidbits is the following quoted from the sidebar on page 51: "In the first nine months of 1988, the California Highway Patrol logged 200,000 calls to its 911 emergency number from drivers using cellular phones." Food for thought to those who tout the emergency/public service aspects of amateur radio.

In fact, this article should scare the hell out of any amateur concerned about the future of the service.

Phil

4353. Re: Intermodulation

Newsgroup: rec.ham-radio

Re: intermodulation, in this case the Yaesu FT411

I called the 800 number posted recently to get the scoop. After numerous busy signals and no-answers, I learned:

The factory modification corrects an intermodulation problem. It changes the IF from 17.3 MHz to 21.0 MHz. Why? The FT411 does not contain varactor tuning because "it's harder to fix, and apparently was cheaper to build it without that feature". (A quote from the guy I talked with: "They're designed and manufactured in Japan, we just sell them here.") Hence the FT411 has a wide RF front end, about 28 MHz, and a higher than usual IF, 17.3 MHz, to "push" image frequencies out of the front end band.

Unfortunately, the IF is just right for a repeater at 145.250 MHz to swamp 162.550, a common weather channel, through intermods. This was the case in Indianapolis, where a powerful wide-area repeater interfered with receiving weather radio channel 1.

Searching my (Colorad) frequencies database for deltas of 17.3 MHz (plus or minus 5 Khz), I found surprisingly few conflicts. Send me mail if you want details. Based on this list and the fact that the sensitivity is pretty terrible out of band anyway, I don't think I'll give up my radio for a month to have the IF changed...

In article <900717-062708-5294@Xerox> "Paul_Adler.NEROSM"@XEROX.COM writes:
>I am planning to buy a new rig. Does anyone have any comments or
>experience with the YAESU FT1000 (basic model) or KENWOOD TS950S (without
>DPS option)?

One of the nice things about belonging to the Johnson Space Center ARC is getting to play with the radios the manufacturers have loaned the club for the SAREX mission. We have a 950SD, an IC781, and an FT1000. (No, I don't know if the 950 has the DPS [DSP?] options, but it does have the "Digital Frequency Synthesizer" label on the front.)

All three radios do just peachy fuzzy on the air; about the only difference I've noticed in my playing around is that the 950 doesn't do full breakin CW quite as well - the receiver has an annoying thump as you let off the key, and sounds a lot choppier as a result. Neither the 781 nor the FT1000 have this problem. All three have good, sensitive receivers that don't get overloaded easily.

The 950 has more useful metering than the other two; it has two bargraph meters shared between four functions, while the others have a single meter and a switch. The 781's spectrum scope is nice, but it takes a little learning to read.

Operationally, I like the FT1000 over the 950. (Those are tough words for a Kenwood bigot.) The controls are better placed and better laid out, and generally more useful. The second receiver/split VFO on the FT1000 has its own tuning knob, something the 950 lacks. It's also more intuitively obvious how to set up the radio.

On something that expen$ive, I'd strongly recommend spending a couple of hours, minimum, playing with them before you plunk down your money; failing that, at least get a return agreement. They're complex radios, and it takes a while to familiarize yourself with them - and longer yet to where operating them becomes second nature.

This account is somewhat disjointed, admittedly, and it's based on somewhat fuzzy recollections of operating each radio for a few hours. Caveat emptor. Your mileage may vary. Not valid in Ohio or where prohibited. Read the Prospectus before signing anything. Prices slightly higher in Alaska. :-)

I thought Devon might have pointed this out by now, but since he hasn't...

He programmed the marvin callsign server to search on the "previous call"
field as well as the current one when you enter a callsign. So if the
call you're seeking has been held at any time within the last few years,
the server will find out.

What I don't know is how long the FCC keeps the previous-call info. Maybe
some of you who've changed callsigns in the past few years can experiment
and figure it out. (And then let us know.)

I am in need of a modern, simple VOX circuit. The last circuit I
located was vintage 1980 and I would hope there is something simpler
than 8 transistors! Maybe a couple of IC's ??? If you have any circuits
of recent vintage for VOX circuits, I would like to see it. I need this
circuit for keying a transmitter from an external command receiver
(scanner). Supply voltage of 12VDC and 12VDC relay to key PTT.
If you could send me a photocopy or give me a reference, I
would appreciate it. I can be contacted at KA2RAF@NN2Z.NJ or at the
following postal address:
Chris Crosby KA2RAF

I didn't think it was that bad. It seemed to assume that amateur radio
frequencies should be protected (using the national park analogy).
This in an article that doesn't even assume protection for VHF TV.
I was disappointed that they didn't mention the emergency use of
ham radio.

On this other hand, if one has not been reading the net or the ham
press, the concept of auctioning spectrum could come as a bit of a shock.

Hey - that is a good idea too. One thing though, when you heard di-di-di-dah, you would think 'Beethovens Fifth'. Then you would have to remember that somehow that 'mapped' to the international character V. Using Bob's method, di-di-di-dah would conjure up 'Victory Vee' in your mind, and automatically you would know it was a V.

Jumping ahead - I don't know how fast you can go by translating the phoenetics to the characters. But this I guarentee - by the time you know the whole alpahbet - you no longer hear di-di-di-dah, then think of the phoenetic, then translate that to the character. After about a week, when you hear di-di-di-dah you will automagically write down 'V' with no further processing by your brain. It really does work. I got my novice ticket using this method, and after two years was up to 18 WPM. I then let my liscense expire. That was about 1975. Suddenly in 1985 I decided I wanted to be an amateur again. I remembered the code so well that I walked out of my first test session with credit for the 20 WPM code test and an advanced class ticket. I thought that I would have to start over again learning the code, but to my surprise was doing 20 wpm no problem after a 10 year lapse in use of the international code.

>What would your answer be, Phil?

"It's obvious that it's time for all of us (Communicator and otherwise)
to move on up to the higher bands to relieve the congestion on 2m. And
perhaps we might even try some new ways of allocating spectrum on 2m so
we can relieve the congestion there."

As the old saying goes, necessity is the mother of invention. But I'd
rather the necessity come in the form of new amateurs (i.e., Communicators)
than because most of our bands were no longer assigned to the amateur
service. If you think 2m is crowded now, try scanning the land mobile
bands.

Message-ID: <9007191123.AA10696@ucsd.edu>
Source record: 10172

A recent posting mentioned an old fart who remembered when 146.94 was a SIMPLEX frequency.

How about the old 34/76 repeaters?
How about when repeater IDers were made from a clock motor turning a gear with the teeth filed off activating a micro switch to a tube oscillator?
Remember when you could drive from coast to coast with a two channel radio (94/94 and 34/94) and work a repeater in almost every town with hams?
How about whistle acess for repeaters?
And my favorite, pre-"new repeater rules" machines called super repeaters by most on mountaintops with multiple receivers, 250 watts out, and hundred+ mile range?

Yes, those were the good old days of 2m FM.

Message-ID: <12606912053.10.POPYACK@TOPS20.RADC.AF.MIL>
Source record: 10171

Reliability of electronic devices decreases with temperature cycling, vibration, and other environmental stresses. Also, the reliability of the parts used to build your radio play a significant part in the trouble free lifetime of your radio.

Temperature cycling is probably one of the biggest causes of equipment failure.

Either leave the equipment ON or leave it OFF for the maximum life. I own a repeater is left on all the time. Never have any problems with it (other than me mistuning it once in a while, hi).

Watch other factors which may destroy your equipment -- over temperature conditions (sunlight from a window), high humidity (basements), vibration, over voltage power supplies (under too), transients, static discharges (dry weather carpet walkers club), lightning, corrosive environments, and extreme cold.

I don't think you will have a problem leaving your rig on all the time (unless it is a heathkit)....

Maybe I don't scare easy, or maybe I believe you use the right tool for the right job. I don't forsee a lot of cellular phones being used to coordinate races, public events, etc. It can be done -- but to get the level of service you need would be expensive. The right tool in this case is something that doesn't get billed by the minute and allows contacting multiple stations at one time. I.E. radio until something better comes along.

Besides, the sidebar apparently doesn't mention that the number of crank calls from cellular phones has the emergency services ripping their hair out, "He cut me off! I had to slam on my breaks! This is his license number, I'm following him right now, and I want a car out here to arrest him pronto!"

You have been misinformed if you think that response is better via bureau than direct. Overseas direct requests, when done properly, result in better than 90% success within one year. Bureau requests would more approximate your 50% figure within five years. Any DXer I know who "needs" a foreign card will send direct to the DX station or his manager.

Ken Hendrickson, N8DGN/6, writes:

<>

I question the rationale for such an exclusion. I particularly question it from the point-of-view of the FCC, which is supposed to be concerned with serving the public interest. To quote from my comments on the NPRM:

"Communicator licensees should be granted full privileges above 30 MHz, subject to the 200 watt PEP power limitation in the NPRM.... It is important that Communicators have access to the two-meter band, in particular. The majority of VHF packet radio and voice communications--both general-use and public-service--occurs on this band. Morse code operation is practically nonexistent. Excluding Communicators from two meters would severely limit their ability to participate in the mainstream Amateur Radio experience, and thus dead-end many new operators who otherwise would become motivated to upgrade. Indeed, many amateurs find that their two-meter operations bring them in contact with other local hams with common interests. Although two meters is the most-congested VHF band, I believe it can tolerate an additional influx of users. Furthermore, increased traffic on two meters will stimulate increased use of alternative VHF/UHF bands, in itself a desirable objective.

"...The ultimate criterion must be how to best serve the public interest; I fail to see how excluding Communicators would meet this test."

I've tried to abstain from most of the "flaming" on the no-code issue. It's not an easily-resolved problem, and emotions run very deep. However, if you (like me) reach the point where you decide that a no-code license class is a good idea, it's really hard to justify excluding Communicators from 6 and 2.

I agree with Phil Karn:

I have had trouble making my B&W AP-10 apartment antenna work on 40 meters. I can tune the resonantor to 1:1 SWR with my KW SUPERmatch antenna tuner, but the antenna radiates like a dummy load. Eight feet of wire stretched across the room loaded with the antenna tuner works way better. Ideas.

I am posting this article for a friend of mine. He has some close friends in Liberia that he got to know while in the Peace Corps. Because of the rebellion there, he has become concerned about their safety. Unfortunately, communications have become disrupted, and he is unable to get through to anyplace in the country using the telephone system.

He would like to get any news he can of:

1. Cuttington University College in Suacoco, Liberia

2. Moses T. Cooper & Family in Monrovia, Liberia

In addition, if anybody out there can suggest alternative ways of seeking this information, I would greatly appreciate hearing from you. In particular, I would like to get the names or addresses of any Internet sites in or near Monrovia, or find out how to contact any Ham-radio operators that are in communication with Monrovia.

Thanks.

Why should we limit the power to 200 watts, lets remember that these people under the proposal are only different from the Tech by way of the code requirement. I believe they should have the same uhf/vhf privs as the current Tech class ham.

4381. QSLing ratios

Newsgroup: rec.ham-radio
Date: 1990-07-19 19:53:54 UTC
From: kb2glo@cbnewsj.att.com
Message-ID: <1990Jul19.195354.16935@cbnewsj.att.com>
Source record: 10084

All this talk of QSLing got me interested enough to check my QSLing ratios.
I've been DXing (mostly on 10 meters) since March of 1989 so I'm a relative
new comer. I've always added notes to my cards thanking the other person
for their QSO and card. If I need the card for an award I always state that
as well. To get my DXCC count up quickly I've always included a green stamp
or 2 IRCs and send direct for the first couple of contacts with a new country.
Once confirmed on any band I send my card via the buro and do so about 10 times
a year.

Well when I ran some statistics I was rather surprised at how low the
buro ratio was. I wonder if cards take much more than a year. I've been
getting a few cards a month but my log seems to have many more contacts.
Most of my DX contacts have been with Europe but I do have scattered contacts
on other continents as well. The best bet seems to be the use of managers!
Of course I always included an SASE... I only did stats on QSOs that were
over 6 months ago so as to reduce errors due to them being in the mail.
Well here is what I found.

Direct DX with GS or IRCs: 113 sent, 90 recieved, 80%
Direct USA, SASE if new state otherwise postcard: 457 sent, 349 recv, 76%

Via the BURO: 126 sent, 25 received, 20% (pretty low?)
Via the BURO and over one year: 28 sent, 9 received, 32% (not much better)

Via a QSL manager 31 sent, 29 received, 94% (way to go!)

Well the low BURO count disturbs me because if I have the country confirmed
and it is only a new country on a different band I've been sending them
via the BURO....

I think my USA ratio is pretty good but that is probably because I sent
out maybe something like 75 SASEs (or more?) to complete my WAS...

I'd like to hear other people's experiences, especially in regards to
QSLing via the BURO. 73 DE KB2GLO.

4382. Communicator Class Examinations

Newsgroup: rec.ham-radio
Date: 1990-07-19 21:10:50 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12606998453.14.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 10089

As one who finally made the decision to just learn the code rather than wait for some action by the FCC (which BTW I learned in about 14 days to the 5 WPM level), I think Ken Hendrickson is goning a little overboard on new testing requirements. What he describes is an examination for a computer scientist, or EE who specialized in computer systems. Only the last two categories relate directly to communications as such. I favor a written exam that demonstrates that the licensee has a sufficient knowledge and understanding of ham radio and radio operation required to operate within those boundaries.

What appears to be happening is that the no-code proponents, sensing the ultimate futility of total opposition, now wish to place such an extreme testing burden on Communicator class entrants that very few people will take or pass the exam. The end result of this argument is still the same: exclude all but the most technically educated unless you learn the code.

Let's enforce a uniform standard. If you propose a tough new exam with the technical level described, then how about we reexamine ALL current license holders as well - what's good for the goose should be good for the gander. You might find someone who can pass the stiff exam looking down their nose at you as technically ignorant, otherwise.

Look, I learned the code so I could get a license, period. Now I find that supporting a wife, two kids, a dog, and a house means I can't get on the air at my own QTH anywhere in the near future, unless I build my own. You are missing the best filter there is: money. I'm personally convinced that anyone who can hear can learn code, given the attitude that it can be learned. I'm willing to wager (but not much 8-)) that many people waiting for a no-code class still won't get their ticket because studying for the exam will be too much trouble.

So, let's not get carried away with Communicator exam difficulty.

Here is a rebuttal from the author of the Viterbi Decoder code for the
Motorola DSP56000:

The Motorola applications booklet on Viterbi Decoding is entitled
"Convolutional Encoding and Viterbi Decoding Using the DSP56001
with a V.32 modem Trellis Example." It is not surprising that the
booklet does not cover Modem design, it doesn't even hint that it
might.
Typically customers want highly efficient code because they are

using the DSP56000 as a complete receiver and transmitter where
the Viterbi decoding is only using a portion of the processor.
Because the DSP56000 is a dual Harvard architecture, the standard
canned approach to the decoding is so inefficient as to make the
DSP56000 impossible of doing the complete receiver/transmitter design.
The applications note is an efficient implementation giving hints and
suggestions for implementing any trellis on the DSP56000. The material
is difficult to present and to read for this reason. Admittedly,
one must be willing to invest some time in reading the
implementation given in the application note to be able to understand
it. Many customers just use the free DSP code provided by Motorola,
because they lack the time or resources to spend the time it takes to
understand what is happening with the code.
The author is available to answer questions on the applications note
or any other Motorola DSP questions Bob or anyone else might have.
I wonder why Bob did not mention that no other DSP manufacturer has
a free Viterbi decoder? And finally, this same implementation has been
presented at the International Mobile Satellite Conference this year,
and was well received.
Last, the Motorola DSP56001 is, to date, the only single chip solution
for V.32 Modems. Papers and information on this are available from
Motorola DSP Operations.

p.s.

BTW it's Edward A. and David G.

> Tech class ham.

Actually there is no reason to limit the power if the written portion of
the exam is the same. The CW test and maybe some HF questions would get
HF privileges added.

I personally do believe granting 1500 watts and repeater control op privs
to someone who passes a TRIVIAL written exam, which is my opinion of the
current TECHNICIAN exam, is a BAD IDEA. It has not been so bad presently
because the CW test exists and that tends to filter out a lot of the
non-code operators. Removing the CW test lets more non-code operators
in. It could DOUBLE the ham population. Considering that only a small
portion of all hams now activate even 2 meters, the influx to VHF could
be (and probably SHOULD be) large.

The present TECH written test is the MINIMUM to get access to major VHF
privileges, which should include EVERYTHING above 50 Mhz. In my opinion
the power limit should be 50 watts. AND there should be another class
(no-code TECH?) granting full power and repeater control op privs in
exchange for a more advanced rules and technical written exam (at least
triple the number of questions).

Speaking of which, did anyone notice that for last New Year's broadcast
from Times Square, both the network clock and the famous NYC time ball
(well, apple I guess!) were both wrong trying to allow for the leap
second. If my memory serves me correctly, one of the two delayed for
one second, the other delayed for two seconds, when in actuality, the
1 second leap time had already been added at 1989 Dec 31, 23h 59m 60s UT,
which happened 5 hours earlier! Perhaps someone from both places should
have checked with WWV (which of course showed the correct time, with the
one second added at midnight 5 hours earlier than EST.) and adjusted
accordingly. In any event, both the network clock and the ball showed
New Years occurring at the wrong instant.

Or, to play devils advocate, was I simply seeing propagation delay in network
feed to the Phily station whos broadcast I watched? Doesn't up and down time
to a geosynchronous satellite take about a quarter of a second? Anyone else
out there also interested in such technical trivia?

4387. Re: My Comments (official) Sent to the

Newsgroup: rec.ham-radio

Communicators DEFINITELY need to be granted access to 6 meters and 2 meters.

To put the communicators ON THEIR OWN to develop bands like 33cm, 23cm and 13cm would be a DISASTER. It is the presently licensed and experienced hams, who have good technical and operating skills who should be the ones to move on up to the higher bands and develop them. So what if 2 meters becomes a zoo. If you don't like it, sell your 2m HT and buy a 23cm one and help do better what some are expecting Communicators to do instead.

However, I have listened to 2 meters in several large cities, and compared to the small community of 100,000 I live in, the PER REPEATER usage density in the big cities is LOWER than here. But we are getting along with what we have, and perhaps even better. The DX-ers and the packeteers and the ATV-ers are all get in the same 2 meter voice repeater and talk with each other and everyone gets along. Don't count the Communicators out.

4388. Alinco 110 mod for Cellular

Newsgroup: rec.ham-radio
Date: 1990-07-19 22:20:52 UTC
From: genem@hpindda.HP.COM
Message-ID: <5120011@hpindda.HP.COM>
Source record: 10100

Modifications to the Alinco DR-110 2m mobile:

After installing the out-of-band receive mod on my Alinco 110, I accidentally pressed a couple of keys and found I could receive from:

130 -> 170 MHz + Xmit of this range
340 -> 380 MHz - no Xmit
870 -> 890 MHz - no Xmit

To modify the Alinco to receive out of band, perform the following steps:

Remove the top cover by removing the obvious screws. Be careful, as the speaker may stick to the cushion on the top cover. If it does, separate the speaker from the top panel and replace it back in its receptacle within the rig.

Positioned at the front of the rig, look near the tuning knob and you will see a little yellow jumper coming from behind the front panel, looping around and returning to the front panel. This jumper looks like it should have a tag on it saying 'cut me for more features'. Go ahead and take the wire cutters to this jumper.

Replace the top cover on the rig, get everything set back up and turn on the rig.

The next step is to reset the radio. If you don't remember its current programming, you may want to write it down at this time.

When ready to reset the rig, hold down the F key and the VFO/M key at the same time, turn the POWER off, back on, and then let go of the keys. The rig is reset and will display 144.00.

You will now be able to tune around, and transmit, from 130.00 -> 169.99 MHz.

To move to the next 'band segment', press F and then the MHZ key. The display will go the 340.00 MHz segment. F+MHZ again will get you cellular, and F+MHZ a third time will return you to the 2 meter segment. Happy monitoring...

Source record: 10094

I am requesting from anyone who has the mods book for the RS Pro 2005 scanner some information. I have ordered my book from CRB research books, and I am just too impatient to wait for it. Can anyone can tell me which diode to cut to access the full 800MHz band. I own the servic manual for the Pro2005, which includes the schamtics. Also, if anyone has any other 'easy' mods, feel free to send them to me.

Also I am going to take classes from a local ham group so I may earn my novice license. With all the talk about code and ways to learn it, I am a bit confused as to which is the best way. CAn anyone provide an outline for learning the code? I wrote a program for the C128 computers that will translate any text into morse code (which is how I entend to practice until I start this class in the fall.) I am eager in starting my education of code, that I may EARN my first ticket.

Thanks for your help in advanced.

Phil Karn said:
> Those who support no-code privileges only above 220 MHz sound a lot like
> people who say they're all in favor of equal housing rights, as long
> as nobody moves into THEIR neighborhood...

I replied:
... or maybe they see Communicators as a way to get occupancy on
the higher bands before we lose them all. We don't need 99% of all VHF
operators concentrated on 2-m FM.
"We gave you the no-code Communicator class because you said it would bring
in people who would populate the microwave bands. Now N years have passed
and all the Communicators are on 2-m FM, and the 220-and-up ham bands are
still as empty as ever."
What would your answer be, Phil?

Phil's answer is:
> "It's obvious that it's time for all of us (Communicator and otherwise)
> to move on up to the higher bands to relieve the congestion on 2m. And
> perhaps we might even try some new ways of allocating spectrum on 2m so
> we can relieve the congestion there."

> As the old saying goes, necessity is the mother of invention. But I'd
> rather the necessity come in the form of new amateurs (i.e., Communicators)
> than because most of our bands were no longer assigned to the amateur
> service. If you think 2m is crowded now, try scanning the land mobile
> bands.

I now reply:
I don't think Phil's reply would help us ward off the land mobile people who
would be pointing out 220-and-up ham frequencies remaining unused years AFTER
the existence of a Communicator license. Phil, do you feel that we need
more people on two to save it? I see letting Communicators on two as directly
leading to the LOSS of many of our higher bands.

Also, pious statements like "it's time for all of us ... to move up to the
higher bands ...." haven't proven effective for the last 30 years. I propose
that the best "new way of allocating spectrum on 2m so we can relieve the
congestion" is to limit Communicators to 220-and-up bands (where gear is
presently available and not very expensive). There are enough "real" hams on
440 that the newcomers will not lack for contact with more experienced hams.
Novices have had phone privileges on 220 for some years, with little effect
on its occupancy. Why? Because Novices also have phone privileges on a lower
band (10m). It's been many years since my last regular operation on 2m, so
I'm not trying to keep "them" out of "my" band.
* * * * *
I have this nightmare that if we let Communicators on two, we are sealing

the doom of many of the higher ham bands.

* * * * *

73, Bob W3OTC

4395. Re: Lat and Long listings?

> I need something that can provide accurate (but not down to
> seconds) Lat and Long coordinates for a given city or area

If you're lucky enough to have access to the Internet, there is
a geographic information server at martini.eecs.umich.edu, that
will give you lat/lon, population, ZIP code, and lots more.

Geographic name server
command:
telnet martini.eecs.umich.edu 3000
or
telnet 35.3.64.4. 3000

Data came primarily from the US Geodetic Survey and the US Postal
Service. Coverage includes all US cities, counties, and states,
as well as some US mountains, rivers, lakes, national parks, etc.
A few international cities have also been included.
Unfortunately, some minor inaccuracies remain. Merit Inc. is not
responsible for maintaining this data.

Queries should generally look like the last line of a postal
address, as in "Ann Arbor, MI 48103".

All these queries will also work:
1) ed(1)-style regular expression, like "[Bb]os.*n$"
2) A city name alone, like "Ann Arbor"
3) A ZIP or ZIP+4 code alone, like this: "46556", "48103-2112"
NOTE: only the first 5 digits in a ZIP+4 code are used.
4) As in 1) or 2) but with a state name or abbreviation, like
this: "Ann Arbor, MI", "Los Angeles, California"
5) As above but with optional nation name or abbreviation, like
"Toronto, , Canada". NOTE: there are currently very few
foreign cities.

Yea!
This sentence is absolutely right.
So far, so good, but...

>And perhaps we might even try some new ways of allocating spectrum on 2m so
>we can relieve the congestion there."

Boo!
You still haven't come up with a solution that solves both the technical
and political problems involved. Any new way of allocating spectrum that
won't be accepted by the ham population won't work.

ARRL LETTER Volume 9, Number 13, June 29, 1990

NEW NOVICE EXAM FOR SOUTH AFRICA TO INCLUDE CODE

South Africa soon will institute a Novice license, following closely on the heels of a similar new license in Great Britain. Details of the new Novice, or Class B, license, were published in the June 22 edition of the Government Gazette.
Applicants must be at least 12 years of age, and will be required to pass a 5 wpm Morse code exam administered by the South African Radio League. After passing the CW test, candidates will take a written exam in operating procedure and "knowledge of the ITU phonetic alphabet."
According to Hans van de Groenendaal, ZS6AKV, president of AMSAT S.A., the SARL has been working behind the scenes for several years and "has based their proposal to the South African authorities on the proposed UK Novice license."
"The introduction of the Novice license," says van de Groenendaal, "will stimulate the growth of Amateur Radio in South Africa and will serve as a model for other countries in Southern Africa. Industry sees the introduction as a move to involve more young people in communications and electronics."
The new Novices, who will receive ZU1 call signs, will be allowed 5 watts DC input (or 20 watts PEP output), and will be able to use phone, CW and data on 160 meters; CW and data on 80 and 15 meters; and CW, data, and phone on 10 meters and 70 cm. SARL is preparing to begin giving code tests, and the first technical examinations will be held in November.

NEW USER FEES TO SUPPORT DXCC

The ARRL DX Century Club will institute a new fee schedule Oct. 1. DXCC, while affecting a relatively small percentage of its members, is a substantial financial burden on the League. User fees, approved by the League's board of directors, will go toward better service (quicker turnaround time).
The fee structure is intended to encourage participants to send less frequent individual submissions to DXCC. Here is the basic outline:
1) After Oct. 1, every first-time applicant for DXCC will be charged $10.00, in addition to the usual charge for return postage. DXCC members as of Oct. 1, 1990 are exempt from this registration fee.
2) ARRL and CRRL members will be allowed free of charge one submission per calendar year; this annual submission may include

any number of QSLs, any number of DXCC awards, and any combination of new and endorsement applications. It does not include a person's all-time first submission.
3) Non-League members outside the US and Canada will be charged $10.00 for their first DXCC submission of any kind each calendar year.
4) US and Canadian DXCC participants who submit more than once in a calendar year will be charged $10.00 for each submission after the first one. Foreign non-members will be charged $20.00 for their additional submissions.

NEW TEST PROCEDURES FOR DISABLED

People suffering certain disabilities will get a break on Morse code requirements, FCC announced June 15 at the sixth annual meeting of Volunteer Examiner Coordinators.
The new procedures will allow volunteer examiners more flexibility in administering exams to handicapped or disabled people.
Given a physician's statement attesting to the handicap or disability, examiners may be able to substitute a Morse sending test for one in receiving, to allow spoken instead of written copy, and to use a Morse code recognition exam. More details on this will be forthcoming.
On other matters, the VEC Question Pool Committee, chaired by Ray Adams, N4BAQ, recommended continuation of all current questions, pending outcome of proposals to change the licensing structure (namely, the FCC's Communicator Class proposal).
FCC personnel listened to comments on the proposed Communicator Class license from the Communicator Recommendations Committee, as well as a summary of the League's "Strawman" position (see July *QST*, p 54).
The CRC also recommended that the 6- and 2-meter bands be included as privileges for the Communicator since "main-streaming" these new amateurs is one of the many goals of the new proposed license class. Also recommended was that all Novice examining be brought under the auspices of the VEC program.
The subject of fraudulent applications was discussed with no consensus reached on the extent of the problem (if indeed a problem exists).
Tom Ingram, K4OOV, of the Central Alabama VEC, was voted Chairman of the Conference for the next year.
The meeting, held in Gettysburg, PA, was attended by 12 of the 18 VECs, seven FCC staff members, Harry Dannals, W2HD (representing QCWA), two ARRL directors (W3ABC and N4MM), Evelyn Garrison, WS7A (of ICOM, representing manufacturers), and observers from the Military Affiliate Radio System (MARS).

PROGRESS FOR INJURED SOVIET HAM

A 25-year-old Soviet amateur is making progress following injuries sustained in an automobile accident, thanks to the assistance of radio amateurs both here and abroad.
As reported last issue, Oleg Porugov, UA4FAY, was in a coma following the May 25 accident, and it has not been possible to move him from a hospital in Ryazan to better facilities. Through the efforts of several American hams, three shipments of supplies have been sent to Ryazan. An additional shipment of intravenous feeding solution has been sent by West German amateurs.
Medical consultation between Dr. Joseph Izzo, of Foster City, CA, Dr. Lawrence M. Probes, ND8S, and Dr. Charles L. Starke, NX2T, and Soviet physicians continues by both Amateur Radio and Telex messages.
A month after the accident, Porugov's condition continues to improve and the doctors are guardedly optimistic. Porugov is able to see and recognize friends, his partial paralysis appears to be abating, and he now is breathing entirely on his own.

RADIOSPORT EVENT RECEIVES GRANT

The World Radiosport Team Championship (see May *QST*, p 48) has received a check for more than seven thousand dollars from the ARRL Mullan Fund, the balance of a grant from the T. Mullan Foundation established to enhance goodwill between the peoples of the US and the Soviet Union.
Final arrangements for operating permission for visiting amateurs from the Soviet Union and several eastern European countries are being hammered out at this time.
Amateur Radio press kits for the WRTC, as announced in May *QST*, are ready for mailing; send an SASE for yours.

TEXAS HAMS WIN TOWER RIGHTS

Amateurs in Bedford, TX won a major tower victory earlier this month. On June 12 the city council of this Dallas-Ft. Worth suburb unanimously approved a 65-foot tower ordinance. A dispute which had begun in October, 1989 over the 60-foot tower of Mike Simpson, WB5SUF, had escalated to include virtually every amateur in the city.
The Simpson case, according to ARRL volunteer counsel Lanny Priddy, K5LP, was not a PRB-1 case, because it concerned plat and deed restrictions, not a local ordinance. Priddy did, however, cite PRB-1 in his arguments.
Ironically, Simpson praised the homeowners who had complained to the city. "They allowed the city to clear up the entire antenna question," Simpson said, because "before the ordinance hams had been given a plethora of conflicting information at city hall."

U MEMBERS TO VOTE ON BURMA

Member societies of the International Amateur Radio Union are being asked to vote on the possible termination of membership

of the Burma Amateur Radio Transmitting Society (BARTS). IARU Calendar 149, sent to all IARU societies June 12, notes that Proposal 195 was directed by the IARU Administrative Council at its April meeting in Spain.
Amateur Radio was officially banned by the Burmese government on January 10, 1964. It now is believed that "there is no one presently alive and living in Burma who has any connection with BARTS." The last communication from BARTS to the IARU occurred in 1976, from Zaw Yee, ex-XZ2SY, indicating that the society was inactive. Zaw Yee died the following year.
Votes are due no later than Nov. 12, 1990.

DISASTER RESPONSE DISCUSSED

A meeting of League and emergency response volunteers met June 12 sought to cement emergency planning through the National Disaster Medical Service. The Service, formed in 1983, would be called into operation in the event of a catastrophe beyond even the ability of an entire state or region to handle, only upon a state's request.
Communications still is a sticking point of the plan. While the National Communications System (NCS) is the major player, holding government communications assets such as leased and government-owned telephone lines, microwave systems, satellites and HF radios, the government agencies using these services necessarily will put their own needs first. It is impossible to determine in advance how much excess capacity will be available for medical evacuation and related purposes.
The lead agency for communications is the Federal Emergency Management Agency. FEMA's main mission is to coordinate federal response to disasters. Its plans for handling NDMS messages are unclear.
While all NDMS members at the meeting agreed that amateurs will be a part of any response to a major disaster, the League has expressed its concern that amateurs will be thrust into a de facto *primary* role. Since amateurs would already have been mobilized at the local level, their numbers and resources would likely be strained by a "national call-up."
Further discussion addressed amateurs' assignments and roles, as well as the establishment of message formats and protocols. A drill planned for October likely will include the ARRL in some yet-to-be-determined capacity.
Ultimately, the ARRL Board of Directors will decide whether to approve a formal Memorandum of Understanding between the NDMS and the ARRL.
Further talks are scheduled for July 12 in Washington.

FIELD DAY

Conditions were--to put it gently--rotten. But they tested our mettle as communicators, and that's what ARRL Field Day is

all about.
Novices in particular, lulled by superb 10 meter conditions the past couple of years, may have been shocked by the white noise on that band over the June 23-24 weekend. They were treated to a taste of what's to come when the sun quiets down in another year or two.
Alternate modes of communication, particularly VHF packet and satellites, were kept especially busy this FD. Messages appeared on various packet clusters from FD stations in the field, and activity on AMSAT as well as Soviet and Japanese satellites was healthier than ever.
W1AW made a couple thousand FD contacts, in the process shaking down both new aerials and equipment at the visitors' operating positions. Six operators used computers for logging at four operating positions, running prototype FD software developed by ARRL contest assistant Mark Burke, KA1MIS.

BRIEFS

* Corrections: Gay Milius, W4UG, who died June 6, was not ARRL Hudson Division Vice Director in 1951 and 1952.
The name of Allen Singer, N2KW, was misspelled in Volume 9, Number 12.

* FCC recently adopted an order implementing the license fees for most radio services other than amateur which had been established by Congress in the Budget Reconciliation Act of 1989. An unclearly drafted item in that order relating to duplicate licenses has been misinterpreted, leading many amateurs to believe that a 35-dollar fee is required for duplicate amateur licenses. This is not true--FCC collects no fees for any amateur license transactions.

* Congratulations to Leon A. Faber, W7EH, of Phoenix, and A.G. Wentzel, W2HX, of Trenton, NJ, both of whom recently marked seventy years as League members.

* The new target launch date for Shuttle STS-35 (and SAREX) is August 12 at 0506 UTC.

* Amateurs needing Kenwood parts now can phone toll free 800-637-0388 to place orders at the Kenwood USA facility in Long Beach, CA.

* On June 11 the Shelby (TN) County Commission unanimously approved an amendment allowing Amateur Radio towers up to a height of 65 ft., according to Atty. Albert C. Burnham, W4RIM. Previously, the Memphis City Council and the Land Use Control Board had approved the amendment. Completion of the process now has raised the allowable height from 35 to 65 feet.

* Nathan Gidron, general manager of Motorola Israel, has announced Motorola's "adoption" of the Israel Amateur Radio Club.

Operating for years without a home, the club began a fund drive a few years ago that fell short. Thus, Motorola will be allocating a room of 40 square meters for use as the offices of IARC, which is Israel's national society. (From *HaGal*, 4X1MK and 4X1AT, editors).

* Satellite enthusiasts and AMSAT members are advised that the former *Amateur Satellite Report*, now called *Oscar Satellite Report*, no longer is included in AMSAT membership. As of April 1, *OSR* is received by subscription from R. Myers Communications, PO Box 175, Litchfield CT 06759 ($26 per year for 24 issues).
AMSAT has, according to Myers (who is W1XT), "provided encouragement and support" during the changeover. Myers has been editor of the publication since its inception in 1981.

* Ham club officers will be interested in the latest (1990-91) edition of the *ARRL Club President's Workbook*.
Complimentary copies already have been sent to ARRL officials and ARRL affiliated club presidents. Additional copies are available from HQ for $7.50, including shipping and handling.

* Is there anyone who doesn't love museums? We can heartily recommend the Antique Wireless Association's museum, located in the Finger Lakes region of western New York, near Canandaigua. The whole family can enjoy this trip back in time, as the AWA Museum features not only Amateur Radio but just about every kind of wireless, as well. Next door is the East Bloomfield Historical Society with exhibits of interest to everyone.
AWA Museum hours are 2-5 pm Sunday, 2-4 pm Saturday, and 7-9 pm Wednesday, through Oct. 31. Group tours are available by appointment. Bruce Kelley, W2ICE, is curator. AWA Museum, Main Street, Holcomb NY 14469. Phone 716-657-6260.

* First call for papers for the AMSAT-NA Space Symposium, to be held Oct. 10-12 in Houston. The symposium will feature talks on the latest technology in both the manned and unmanned aspects of the Amateur Radio space program. Talks on MICROSAT utilization are particularly wanted. Send summaries of proposed papers to AMSAT-NA, 850 Sligo Ave., Suite #600, Silver Spring MD 20910 by July 15. Those selected for presentation will be notified by Aug. 1.

4398. Six Meter Amplifiers

I just purchased a Yaesu FT690 six meter all mode radio.
It has 2.5 watts output and I would like to amplify is to at least 50 W.

Does any one know who makes 6 meter amplifiers and where they can be
purchased.

I also might build one and have found an article in an old issue of
QST. I would like to here from someone who has built a 6 meter
amplifier.

Any hints would be helpful.

4400. ATV BALLOON LAUNCH. W H E N ? ? ? ? EVER?

Newsgroup: rec.ham-radio
Date: 1990-07-20 13:01:35 UTC
From: POPYACK@TOPS20.RADC.AF.MIL
Message-ID: <12607171531.11.POPYACK@TOPS20.RADC.AF.MIL>
Source record: 10102

There I was tuned into 7155 Khz and something about a baloon launch (I was late in turning on the rig, 9:05 AM). Something is strange -- a bunch of 4 prefix calls, Hmmmmm. I better get the TV all set up fast! So there I am scrambling to set-up the TV on channel 60, throw up an antenna and catch the NH ATV Baloon launch (which had been delayed every weekend). Then I hear a bunch of Florida stations "Gee Awww WOOOW I got the signal!!!!"
WELL? WHY AM I NOT RECEIVING IT? Then Net control says this is the Florida Balloon launch. WHERE IS NH BALLOON LAUNCH AND WHY ARE YOU FOLKS ON THIS FREQUENCY???? Turns out the New Hampsire Launch is up 25 KHZ and had been cancelled.

HOW ABOUT SOME COORDNATION ON THESE THINGS????

WHEN is the ATV Balloon going to be launched?

Thank You. Ramblings of an ATV BALLOON LISTNER who has NEVER heard one yet.

> Also I am going to take classes from a local ham group so I may earn
my novice
> license. With all the talk about code and ways to learn it, I am a bit
> confused as to which is the best way. CAn anyone provide an outline for
> learning the code?

The best way is to sit down and do it. Trying to find the "best" method
can easily
take twice the time that it would take to learn using *any* method. You
don't even
have to wait for the Fall -- just go to Radio Shack and get a copy of
the Novice
study program, study the way the tell you to and in three week's time you'll be
ready. No muss, no fuss, two General Class hams can give you the exam and
you're licensed.

That said, there are some things that will seriously impede your
learning: using
any of the methods that try to teach cute phrases that "sound" like the
dits and
dahs. It's been pretty well established that you'll cripple yourself at
higher speeds.
If you use your computer program, don't study using text that you have put into
the computer yourself -- you'll already know what's coming and you'll only
fool yourself into thinking you know the code. A good approach would be to
make a little program that randomly generates call signs, Q-signals,
signal reports
and so on. It's great to be able to copy "Xanadu" in morse code, but
that's not
what's going to be on the exam. Listening to code on the air is good for
practice,
but it's only good if you're listening to machine-generated code. While it's
important to get practice with hand-sent code to be effective in CW operations,
that's not the same as getting the ticket. Licensing is gamesmanship,
operating
comes later.

>>>==>PStJTT
Patrick St. Joseph Teahan Taber

My employer doesn't care what I think. I, in turn, don't care what
you think. You probably don't care what my empolyer thinks. Thus is
life a circle.

...
> I'd like to hear other people's experiences, especially in regards to
> QSLing via the BURO. 73 DE KB2GLO.

Expect bureau cards to take anywhere from several months to several
YEARS to be returned.
For example, my recent buro shipment contained cards for QSOs I made
while in Guernsey
in December '88. Note: not RESPONSES to my cards; these are from folks
who want one from
me for 'a new one'! A year and a half. You've got to be patient.

Re: direct QSLing. I haven't counted, but my experience is that most
folks are pretty good
about responding. (the St. Peter and Paul Rocks expedition was a glaring
exception - but that
was the Brazilian postal 'authorities'. It took me a registered letter
to get a QSL!)

Enjoy and good luck.

4403. Communicators on 6 and 2

Newsgroup: rec.ham-radio
Date: 1990-07-20 15:43:24 UTC
From: rossjr%gtec3.dnet@GTE.COM
Message-ID: <9007201543.AA04561@bunny.gte.com>
Source record: 10105

Since my posting on "Communicators on 6 and 2" a couple of days back, there have been several interesting replies. A couple of points I'd like to address:

--Several people have questioned the 200W PEP power limit. Now that I'm pressed to defend it, I realize that, in all probability, I can't. Chalk it up to an emotional reaction to something I simply didn't examine too closely when I wrote my comments. You could make a case that Communicator is entry-level, like the Novice, so use the power as an incentive to upgrade. But, that's pretty weak. Giving Communicators full power privileges wouldn't cause me any heartburn.

--It seems that the "CW will filter out undesirables" argument is still around after all these years. Permit me to quote my comments again:

"In the 1983 proposed rulemaking on this same subject, I filed comments against the creation a code-free license. My experience in the intervening seven years has indicated that: (a) In spite of the fact that five words-per-minute (WPM) code is easy to learn, many otherwise-interested newcomers refuse to bother. (b) The morse code does not provide a "screening mechanism" to maintain the integrity of the service. Although it does "screen out" certain people, there appears to be no correlation between willingness to learn morse code and the caliber of operator. (This has come as a surprise. The "screening" concept was a key element of my 1983 comments.) (c) The morse code is becoming less important as a communications mode. Although morse activity remains high (and I use it myself), future growth in the Amateur Service will clearly be in computerized, digital modes. Indeed, fully half of my NC1N operation involves TCP/IP-networked packet radio. (d)JJThe overwhelming majority of state-of-the art amateur experimentation centers on two areas: digital networking and amateur satellites. Knowledge of the morse code is essentially irrelevant to such experimentation."

--See the above paragraph regarding the "CW is easy" argument. Of course, CW is easy. All of us who are currently licensed hams know that. But many computer users don't care: they've got better things to do. *Relevance*, not ease, is the criterion. Easy or not, they want to spend their time on something the perceive to be valuable.

--Finally, what will Communicators do for the service? Will many people be interested? Well, here in Boston, we have an Amateur Radio special interest group in the Boston Computer Society (30,000 members). The percentage of BCS members who belong to our SIG is more than triple the percentage of hams in the general population. Many have not yet been licensed. This is a good group of people, by and large, and it includes a lot of software types (which we NEED in ham radio). The fact that we'll have to "sell" them on the code from inside the hobby rather than outside doesn't bother me. Nor do I doubt that, once exposed to mainstream experiences like 2m FM, most would want to upgrade.

Let's drop the idea that people who won't take the code test are riff-raff.
All the flames notwithstanding, it simply isn't true.

Yet another QSL ratio report...

My computer tells me the following: (from about March '88 till yesterday)

Direct QSLs sent: 876 (all but 5 for DX stations)
Direct QSLs received: 719
Average turnaround time: 65 days
Return rate percentage: 82%

Bureau QSLs sent: 578
Bureau QSLs received: 144

The "buro" figures are misleading. I've only received 10 cards from the bureau that have "TNX QSL" instead of "PSE QSL." All of those cards came in a packet yesterday! The bureau turnaround time is at least a year or two. I've only received one unsolicited direct QSL (from an HB9). Through the bureau, I guess I've received about 134 unsolicited QSLs. The best two were from Malta (9H3??) and Morocco (CN8). The all-time best QSL was from JPL for a QSO during the Neptune encounter (I was mobile on 40m in Utah). The QSL came with a stack of color 8x10 shots of Neptune, its rings, and its moons, taken by Voyager.

OK, what's the deal!

for the last 4 days (12 passes over Seattle) i've been
on FO-20, *ALONE*, except for last night on one pass
some guy from Rhode Island was on...

signals are great, bird is loud, etc...

but, where is everybody !!! their used to be lots of
people on JA mode...

sigh...

joe holman, ka7ldn

(and yes, i too have been working ao-13 in between passes...)...

4407. Glen Baxter goes off the deep end (Listening Tip)

Newsgroup: rec.ham-radio
Date: 1990-07-20 16:54:25 UTC

Cross-posted to: rec.radio.shortwave,rec.ham-radio

I admit it, I like listening to the insanity that has permeated the ham 20 meter band lately. I suppose it is the same fascination that makes some people gawk at a barroom brawl.

Well the boys have picked a new hangout, and it is easy to see why. If you are an SWL, and NOT a ham, I suppose I should take a moment to say that this behaviour is terrible, and REAL hams do not act this way, and I am supposed to be disgusted with "Hams acting like CB'ers" (That always starts a fight, as I know some pretty good 11 meter operators). OK. That said we continue:

For over a year now, there has been a "War" on the 20 meter band. The players include members of the MARITIME MOBILE and INTERCONTINENTAL nets, famous meeting places for traffic handling, including many phone patches for boaters. An opposing group, known as BARF (Better Amateur Radio Federation), claim that this phone patching is illegal, and they hold forth with LONG dissertations against patching. These talks turn into heated arguments, where often the issue is lost, and the name calling and caterwalling turns into a full blown knock down drag out.

Have your popcorn ready.

The fights were confined to 14.313, the frequency used by the NETS, and 14.300, where the nets moved to get away from the noise and insanity. All day and night, on one of these two frequencies (SWL's you will need to use UPPER SIDEBAND to listen, using a BFO or USB switch if your radio has one). It is a good lesson in human behaviour studies, and may not be YOUR cup of tea. Still EVERYONE should at least listen to get the picture at least once.

Lately though, at least this past week, the war has moved to new ground. 14.275mhz. The normal home of IARN, the International Amateur Radio Network, has been total chaos. Glen Baxter, K1MAN, who operates the IARN, is a self appointed "bulletin station" He has regularly scheduled "Broadcasts" on the frequency all day long. These 45minute shows (Can you guess he uses C-90 tapes?) are supposed to be news and information for hams, and as such, are supposedly legal under FCC rules, Because the ARRL (Amateur Radio Relay League) operates its own bulletin station (W1AW) which also transmits bulletins of information about ham radio to the ham radio public at large. FCC rules were clearly written to permit this operation (One way transmission for other hams, not for the general public)... BUT it also opens the door for people like Glen Baxter, who is a frustrated radio broadcaster. His bulletin transmissions are as slick as he can make them, with many different voices, and reports taped from other services. Often, very often, these transmissions include

"Editorial Comment". One could argue that such comments are just the other side of the scope of "Information Bulletins". Glen is such an egotist that I am constantly astounded at his audacity.

This past week, Glen brought upon himself and his chosen "Official IARN Frequency", the wrath of the entire bunch of 20 meter rowdies. As I type this article, none other than WA4D (The Dog) is holding forth doing his dog thing. (Some think the dog is THE most obnoxious operator in ham radio, one thing for sure, he is NOT shy).

How did the insanity move to 14.275? Well this past weeks K1MAN "news bulletin program" Transmitted several times each day for the entire past 7 days, was a Tirade against two other operators, namely KV4FZ (Herb) and WB4GDP (Bob). For over 30 minutes, Glen heaped charge upon charge against these operators, which to THIS reporter seem quite libelous. Some of the things Baxter says defame the two operators (They are both KEY BARF members, and both highly controvercial to begin with) Of course, Herb and the boys were not going to let the challenge go untested, so they started holding forth on 14275, and when Glen's regularly scheduled "broadcast" came on the air, They cried that they were being QRMed, and then took the broadcast apart point by point. Following the broadcast, they ripped Glen apart in a manner similar to how he tore into them. Not only giving rebuttals, but pointing out character flaws, and presumed personality defects, with just a touch of verbal assassination.

My personal opinion is that Glen's most recent "broadcasts" (the term he uses, though broadcasting is forbidden by hams) have no place as an information bulletin. It is a way for Glen to express his personal vendetta against other operators in an automated tape playback several times a day. This is not wise spectrum use in the opinion of THIS operator, and further, he complicates things by causing the insanity to crank up on his own 14.275. All week, it has been total bedlam on this frequency from Early morning to Late night. I KNOW these signals propogate to Europe.

You listen and you are either amused or appaled. Those who remember the "golden age" of ham radio, where nothing controvercial was ever discussed, where manners counted, and nobody said "darn".... This type of Ham or SWL will find the current happenings on 14.275 (and 14.313 and 14.000, and others) patently offensive. Those "glory days" are gone. You adapt, or you unplug the antennas.

At times it is total Chaos, Seems as if 20 people are yelling at once. Like I said, it compares to a barroom brawl.

It is real people, BEING real people. It is worth a listen, so you can draw your own conclusions. No one can listen constantly to this stuff, but it is a good study in human relationships.

Disclaimer: If you are a shortwave listener considering ham radio as a hobby, you should listen to many other frequencies. Like USENET, The

ham bands contain a cross section of humanity, and you CAN make
wonderful friendships, and have fascinating discussions in real time
with people all over the world. The 20 meter mess is not the way most
of ham radio conducts itself, any more than the guys throwing punches in
a bar typify all those who frequent said establishments.

That out of the way, tune in and gawk a bit. It's fun. And if you are
a ham and DARE to transmit, be sure and sign you call. It will make you
stand out in the crowd....

>mention, permit me to display a paragraph from PR Docket No 90-55

> Quote of the International Rules deleted so I can get this to
> pass the posting filter....

Fine Julian....but the US basis and purpose has one other added
item in its' list. In fact, if memory serves me correctly its
the first in the list. To paraphrase radically(I'm doing
this from a poor memory ;-) the basis purpose also says to
provide a corps of trained operators to aid in emergency communications.

The new rules rewrite goes even further to codify that fact that
its ok to help out in public service events which was always open
to debate before the rewrite.

You're probably right about the US being an exception in this case
but as far as I can see we're providing a useful service by doing
so.

>Interesting that, "self-training, intercommunication and technical
>investigations". When I studied for my exam, that's what I thought

>it was for. But I suppose that makes me an old fart that doesn't
>understand.

That self-training includes more than one aspect for a US
licensee. It includes self-training as both a techician and an operator.

>If my local emergency service needs more coms these days, they don't
>call out the fat guys with the walkie-talkies on their belts and
>obsolete police radios in their cars. They call up a cellular carrier
>and get some cellular phones that give them instant coms and ability
>to communicate anywhere in the world.

Yes they do. Cel Tel doesn't cover the world (yet ;-). Communicating
anywhere in the world ?? I thought that was what HF was for ;-)
Seriously, as I've posted recently, I just have to look to last
weekend to find an existance proof to nullify your statement.
We had a cell tel with us. Odd...they don't provide service 20 miles
into the back country....but amateur repeaters did. Mind you we did
have to set up a cross-band link to get the coverage we needed...
whoops...the technician aspect of the whole thing just snuck in.

(Note for the readers not familiar with California...back country
implies mountainous terrain. No line-of-sight communications was
available with the major populations centers.)

>Why don't we push the aspects of amateur radio that are in our
>international charter?

I don't see why we can't push ALL the aspects of the US basis
and purpose....

There are other ways to send QSLs than have been discussed thus far.
1. Send cards directly to DX bureaus, rather than thru the ARRL outgoing service. Their addresses are in the Callbook. This saves the time for ARRL to send them to the same places.

2. Use a QSL forwarding service, such as N7RO. For a small fee per card, he sends your cards with an SASE to any known qsl manager (he knows who they are), and then sends the replies to you via the ARRL incoming bureau. If there is no known manager, he sends them via the bureau. This saves you from having to know anything about DX addresses or managers, and saves you lots of postage. I have had good results with this method.

I have no answer to Doug's original questions, but it does bring up some ideas to me. You know how a local 2M rptr. can get jammed up when there's something exciting brewing, such as an SAR operation. What happens when a widespread emergency occurs? Consider that hams (on the average) are pretty considerate folks, and (IMHO) are more likely to have some training/experience in handling emergencies and dealing with emergency communications.

Now.

What happens to the local cellular nodes when the fewmets hit the windmill? IMHO again, the service would go "suddenly and dramatically to hell" as dozens/hundreds of nervous folks tried to get on the air at the same time.

So what really happens? Can anyone in the Bay area tell us what happened on the cellular links during the big shakeup a while back? Some of you must KNOW what happens to the cellular services in these situations. Would you be willing to share your tales?

Curiouser and curiouser,
d

> higher bands ...." haven't proven effective for the last 30 years.

Bingo! The reason they haven't proven effective is because there has never been any *real* incentive to move up. The fact that 220 and 70cm are almost dead outside of major metropolitan areas ("dead", in that they're much less heavily used PER CAPITA) is convincing proof that the most effective way to encourage use of the upper bands is to increase the density of the amateur population.

> There are enough "real" hams on
> 440 that the newcomers will not lack for contact with more experienced hams.

I disagree. Only in major metropolitan areas is 70cm FM activity high enough to make this band a place to assimilate Communicators into the existing amateur population. Remember that there are vast areas of the US with little or no activity on bands other than 2m, and even on 2m in these areas there is plenty of room. One set of comments I saw at the FCC were from an amateur in northern Wisconsin who said that much of 2m is completely idle up there, and any extra activity (even more repeaters) would be most welcome.

Yes doug, most cellular nodes (base sites) do have backup power supplies. I'm not sure how long they are good for (a few hours?).

I say "most" because even though it is supplied with the equipment and its use is strongly recommended by the manufacturer, it is up to the operating company as to whether it is actually used and maintained.

The author of the applications note is Dion Messer and may be contacted
at (512)-891-2694 (Motorola DSp operations). She was extremely polite
and helpful when she called to talk to me about the note. I agree with
every single sentence in the `rebuttal.' I use ONLY Motorola DSP products
in all my DSP work and the architecture and what it affords you in the
way of speed up in a number of applications is the reason. Dion's comments
leaned towards defensive about the fact that it is not an applications
note on modems. I didn't mean to imply that I didn't like the note
because it didn't cover modems. I didn't like the note because it didn't
do what I needed done and that was to explain clearly how do you take
advantage of the architecture of the 56000 series to this trellis decoder
is such a way that you CAN do a single chip modem design for a different
trelllis or different constellation. If I am to be faulted in my statement
it was for calling the `theoretical part' of the note into question when I
should have said discussion part. There is no doubt that this is an
extremely fast Viterbi decoder. It is faster than the one I have written
but the one I wrote I can take and modify it for other applications
with some ease. As soon as I understand Dion's work, I am certain that
I will be a convert. Thanks to Charlie and Dion for the effort.

4419. Re: Ham radio's value (Was: Re: Communicator Class)

Newsgroup: rec.ham-radio
Date: 1990-07-20 20:20:07 UTC
From: t-petesk@microsoft.UUCP
Message-ID: <55993@microsoft.UUCP>
Source record: 10121

I personally thing that the Communicator Class license is a half-*ssed attempt
to solve the symptom of a problem, and not the problem itself. In fact,
I think that this new class could make things even worse if we limit them to
certain bands, or whatever.

IMO, the main problem with ham-radio which is most directly related to the
Communicator thing, is the fact that the hobby is organizationally very
sluggish. We have a licenseing scheme that hasn't changed since before
my time(yes, i'm a youngun).
This licenseing scheme, along with the lack of strong leadership in the
hobby lately, have brought the many diverse groups in ham-radio(contesters,
techies, sattellite jockies, dxers, just to name a few) at odds with each
other. The packet and microwave guys insist that those technologies are
the future of ham-radio, but also tend to insist that code is dead. The
dxers(and other hf guys) tend to be a little anachronistic, but insist that
hf is where it's at. And both groups want to make the enterence into the
hobby for new people nearly impossible.

The ARRL(and other groups) whom are supposed to be leading us are trying to
please all of the groups, whom are all at odds, and end up pleasing no-one.

And now everyone is becomming paranoid about the band losses that we've been
experiencing. In most cases, people blame the band loss on other groups, who
retaliate by pointing the finger the other way.
As all of this happens, our numbers are decreasing...

Occasionally, someone comes along and proposes a way to increase our numbers
(the Communicator Class). Then some jerk in the back row announces,
"What if CBers or Lazy People use this method to join". Then someone rushes
to ammend the new license class to make it inpossible for anyone but a

Phd in CS to pass the exam. yeah, like that does a lot of good.

I say, so what if CBers join, or Lazy people, or whoever. They have just as
much a right to be a ham as an extra who has been licensed for 40 years.
All they have to do is follow the rules(the FCC rules, not the ham radio
"Jim Crow" laws).

Okay, enough of that. I cannot personally complain about something without
helping to find a solution. Seeing as how many problems are related to
the licensing system, here's a new one. This one, believe it or not, makes
a little more sense than the current one. It is similar to that used in
some european countries, but allows for easier entry into the hobby at a
basic level. It doesn't require you to know CW to press the key on an HT.
It doesn't require you to know CW to run an atv camera. And if you want to do
cw, you do not have to know about microwaves.

I know many wont like this sort of scheme, because it takes away the ability to say "yeah, i'm an extra, so i'm better than you", but I'd rather say,

"yeah, i'm a ham, do you want to be one too".

So take a look over it. I'll compile any comments sent to me and try to update the scheme.
(Don't mind the ctrl=Ms, I don't feel like removeing them right now)

The basic license - The basic ham license would be equivalent to the current NOVICE class license. Its purpose would be to allow new hams to experience different modes and bands. The bands and powers allowed would be similar to the current Novice bands, with the exception of some of the CW bands.
Basic Bandplan - 10m - SSB - allows for HF DXing
10m - CW - code practice band.
220 - fm voice - (HT's)

All modes limited to <100WPEP

Requirements - A test covering material similar to the current NOVICE written test.
ie. Other License Classes, SSB operation, CW operation, FM repeater operation, FCC rules, some info about the new licensing structure.

(THIS IS a NO CODE LICENSE)

CW Endorsements - These are endorsements at 5wpm, 13wpm, and 20wpm that allow new bandspace and power for those who wish to operate in efficient CW traffic nets and other such things.

5wmp - allow full NOVICE power in all the current NOVICE bands.
13wpm - general/advanced bands
20wpm - extra bands.

The idea behind the endorsement idea for CW is to keep certain high speed bands clear for power users, but allow room for new CWers. The current scheme of licensing just tends to stratisfy hams, which we obviously do not need at this point in time. It may cause the demise of HR. These CW endorsements are no longer attached to knowledge of satellite operation, or VHF DXing, They are just CW endorsements.

Other HF endorsements

Digital Modes - this endorsements covers modes such as RTTY or HF Packet. The Written test for this mode would cover these subjects.

Special Modes - this covers new or experimental modes, and modes such as sstv, and allows new modes to be developed by the holder.

The test would cover some of the new modes, and things like bandwith, bands, beacons, or whatever.

HF Voice - This covers voice communication. There could possibly be more than one level of this endorsement, allowing for more bands equivalent to general/advanced and extra.

The test would cover, yep, you guessed it, voice modes on hf.
Modulation Methods, simple receiver/transmitter design, etc.

POWER - Amateurs are limited to low(100WPEP) until they get this
endorsement. Strangely enough, the ability to run power
properly has been proven to be not related to the ability
to transmit 20wpm cw, so why link it to cw speed.

The test would cover things like:
PROPIGATION
POWER AMPLIFIER CIRCUITRY
MORE FCC rules

*** How to operate at the minimum power level needed and not
shove a full 1500WPEP or more through our antenna
to the guy next door.

VHF/UHF/SHF endorsements

VHF/UHF operation - this would allow operation on all of the bands at
limited (100WPEP) power. Simplex and Duplex, and other
types of operation. This would also possibly only allow for
bands up to 1.2 gigs or whatever, at limited power. This is
because microwave frequencies higher than this are potentially
hazardous, and should be covered by a separate endorsement.

The test would cover:
Modulation Methods, Propigation
Repeater/Simplex Operation, and so on.

Special Modes - this would cover FS ATV, FM ATV, and other fancy modes,
possibly with space/satellite operation, but that could
be made to be a separate endorsement.

Digital - packet - self explanatory.

POWER - this allow for full power on the VHF/UHF bands (possibly linked to the
microwave endorsement).
This endorsement makes sure you know what you're doing before you
hook up that 1.5KW linear to your 440 rig, and aim at your neighbors
dog.

Microwave - This would cover that "fry your brains" microwave stuff. It
covers microwave(1.2 and above), with full microwave power.

OTHER -

ARRL Politics - this endorsement says that you understand the politics of
the ARRL, and possibly ham radio as a whole. Probably only one or two of
these will be given out, and only to people who've been silent keys for a
number of years.

All current licenses would be converted into equivalent sets of endorsements.
ie, extra would probably get them all. general woud get most, etc.

This licensing scheme is designed to allow hams to operate in the modes they want without worrying about other modes in which they will probably never dabble. It allows easy entry into the hobby, and hopefully will not stratisfy the hobby like the current scheme has.

4420. Qualification-based licensing

Newsgroup: rec.ham-radio
Date: 1990-07-20 20:23:46 UTC
From: goldstein@carafe.enet.dec.com
Message-ID: <13686@shlump.nac.dec.com>
Source record: 10123

I'm working on a more detailed proposal, but I thought I'd post this early just to get a few brickbats thrown at me.

After the current FCC 90-55 proposal is disposed of, I'd like to propose a more serious restructuring of the Service. This throws away Incentive Licensing for good and replaces it with a more legally and morally sound scheme, where the license is earned by (hey, this is really novel) demonstrating the qualifications needed to use the privs that the license gives! Sort of like cars, airplanes, medicine, etc.

This uses about 3 1/2 classes of license. The general rule is that it gets EASIER to get on the air than before. Existing licensees are largely upgraded as a result. Yo, welcome riff raff! :-) Seriously, the idea is to have MORE than just EE's come into hamdom, by concentrating the exams on what you need to use the privs.

NOVICE will have code and no-code flavors, with 30 MHz and down the difference. HF privs the same as now. VHF privs (for no-code) will be essentially all VHF bands, with gaps for weak-signal, sat control and other critical areas where chatters don't belong. The power limits will follow the current Novice: 250 W HF, lower VHF, down to 5 W on UHF where it's more dangerous. The current NOVICE test difficulty will apply. ("Amateur regulations and basic practices, and sufficient theory to understand them.") This is sort of like the Japanese Telephone class, and may be a good way to get young people, YLs, and more "ordinary" people interested. But it isn't CB, it's HAM.

GENERAL will get all VHF freqs and most, but not all, HF. The good DX sections won't be there, sort of like today, but 3/4 of the subbands (phone and CW portions) will be. The code test is lowered to 5 WPM. The written test is about the present level. The power level will be reduced to 250 W, with a possible grandfather clause after phase-in. (That'll get the OT's upset.) General can own repeaters. (Novices won't.) Current Techs would grandfather here too. The idea, btw, is that high power and serious DXing shouldn't be left to those with minimal technical skill, but they should still be allowed to try everything.

EXTRA will get everything. The code test will be 15 WPM, with roughly the current written test. (If you're going to use CW, you'll learn it, but 20 WPM is suspected of causing permanent brain damage. Look at me.) Current Advanceds might grandfather up here.

The idea is not to try to populate quiet bands with newcomers; that is a recipe for disaster. Its purpose is to allow people to get a good taste of Ham Radio without excessive work, while limiting the

amount of damage they can cause themselves or others. If you want to learn something, you learn it. We get out of the Boy Scout Merit Badge business.

I just thought I'd share that all with you; I may post more details later, or we can just debate it.

> ARRL to send them to the same places.

I was just at the ARRL, and learned that they ship foreign cards out every two weeks. IMHO, sending cards direct to the various bureaus only costs you extra $$ and doesn't save a significant amount of time. The real time lag is in getting the cards out of the local bureaus and into the hands of the deserving foreign DXers. Rumor has it that the Russian "Box 88" bureau is backlogged up to 2 *years*!

>2. Use a QSL forwarding service, such as N7RO. For a small fee per card,
> he sends your cards with an SASE to any known qsl manager (he knows
> who they are),

If you are a "Sunday afternoon" DXer, this is probably a good idea. However, if you work *a lot* of DX, you probably want to subscribe to the W6GO list. For something like $20 dollars/year, you'll get a monthly listing of all current DX stations that have managers or special direct addresses. Alternatively, see if your local DX packet cluster has the database on-line.

4422. Communicator Class

Newsgroup: rec.ham-radio
Date: 1990-07-20 22:23:39 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9007202223.AA23127@tecnet1.jcte.jcs.mil>
Source record: 10126

Phil Karn speaks of giving 2 & 6 meter privileges to the Communicator Class and goes into a lot of reasons why. Let me state my observations.

In this area we have ONE 220 repeater. It is up on a 2000 foot tower and has GREAT coverage but NO autopatch. Novices run right out and buy 220 rigs and get on voice VERY quickly. Out of 10 Novices licensed in the last 4 months... EVERY ONE OF THEM BOUGHT 220 RIGS! (Most also bought the Uniden 10 meter rig... voice again)

We also have a few 2 meter repeaters that LINK into the 220 repeater. In talking to these new hams it was found that their number one desire was to upgrade to "Tech" so that they could get on 2 meters directly.

Out of those 10 Novices... all but one has now upgraded to Tech or above, and every one of them now has a 2 meter rig, and ALL of them want to SELL their 220 radios.

In looking over the local clubs roster it is clearly seen that a LOT of the Technicians never upgrade any further. They are happy with what they have, feel no desire to get active on HF, and so... they stay where they are.... usually on 2 meters.

As you can see then, my personal opinion is somewhat biased by the local experience that I have just described. I realize that I can not take this one example and apply it to the whole U.S. of A., but none-the-less, I am left with the definate message that if you allow Communicators on 2 meters right off the gitgo.... then that is where they will stay for a LONG LONG time.

Another person (I think it was Phil Howard.. sorry if I am wrong Phil) made some mention of this being a good thing as it would drive the original developers of 2 meters into moving on to the higher bands. I must question this observation. Hams don't like to be FORCED to do ANYTHING :-) I mean who does? If the congestion on 2 reaches the proportions that are predicted, then the much more likely event to occur (IMHO) is that the new Communicators will be ostracized and treated like unwanted scum by enough hams that these people will be alienated from our hobby in rapid fashion, or will get really mad and will start fighting back in the form of jamming and other nasty tricks. Don't get me wrong... I don't LIKE that prediction (!!!!), it just happens to be the way I see it happening after watching 14.313, portions of 75 meters, and repeater wars on 2 meters a few years ago.

Phil Karn's recommendations are especially apt *IF* we lived in a perfect world. Given the way things are in this part of the country, I can not see these ideas working the way that he predicts. Thus I have to say that it is my personal opinion that the Communicator Class should be limited to 220

and above.

Please feel free to flame... it is just my opinion.

I certainly don't have an inside channel to the FCC, but if I am correctly interpreting the many signals they have been sending over the past few years, any proposal to make the amateur license structure more complex than it already is has a snowball's chance in hell of succeeding.

Every indication is that the FCC believes the current license structure to be far more complex than it should be, and the constant stream of upgrade requests they have to process costs them real money they could be spending elsewhere. This is the reason behind their proposal to do away with the Novice and Technician as "official" classes in favor of operating under the authority of a CSCE. Their claimed inability to modify their computer software in any way is probably true, but I think it would be a mistake to believe that that's their only reason. I would wager that the FCC believes that it's time to bury incentive licensing completely; they just haven't had the courage yet to say so publicly.

The US has more classes of license than almost every other country, and by itself the Communicator will only make this worse. Many countries get along just fine with two classes: a 30 MHz and up license (no-code, of course) and another that requires code and gives all amateur privileges. It's as simple as you can get while still following the ITU regulations. I would see nothing wrong with doing the same here.

If hams want proficiency certificates for every specialized area of ham radio, let the ARRL provide them; it could become quite a profitable little industry. But the actual license requirements should be limited to the basic, universal stuff that all amateurs need to know to operate safely, to avoid interfering with others, and to demonstrate that they're at least capable of furthering the Basis and Purpose of the service.

^^^^^
> only be attenuated by the value of the attenuator. Since John is so close to
> the stations, it may be necessary to use a second attenuator to reduce the
> overall signal strengths to levels near the mid-point of his S-meter.

Because the products are THIRD ORDER they will be attenuated by THREE times
the attenuator value. These products are THIRD ORDER because the second
harmonic of one of them is involved in a product. The second harmonic (go
try it and see) will be attenuated by twice the attenuator value. One can
also think of these products as being formed by taking the DIFFERENCE between
the two signals (800 khz) and intermodulating one or the other of them with
that difference.

If you see only the attenuator reduction, your receiver is POSSIBLY clean.
If you see a PARTIAL reduction (this is why I felt it necessary to pick nits
here) then you have SOME intermod in the receiver and some OUTSIDE of the
receiver. Also, an OVER attenuation (e.g. more than three times) could also
mean the same thing. The coincident phases of several intermod sources can
always confuse the issues. No matter what the results, try several receiver
locations and verify your results as consistent before basing anything on them.

> If the intermodulation is being generated by the transmitters (or any place

Such data would also be less useful for cheaper receivers as the production consistencies are also usually worse.

Notice the term "third order" here. The reason that THIRD, as opposed to SECOND or FOURTH, is useful here is that THIRD order products end up back on the same band as the generating signals. And this is exactly the case we are running into with the 2 FM stations.

>>Armed services even have their own phone network. Do you seriously
>>think that amateurs are the lynch-pin of disaster communications?
>

A few years back, an unusually severe snowstorm blew through the Metro Detroit area resulting in blocked roads, cars lost in drifts, etc.

Of course, all resources were put into the efforts to find the lost and clear the roads. In Washtenaw County (Next to Wayne County where Detroit is) the National Guard was called out. The Washtenaw Armory was a _communications_ battalion. Guess who didn't have any mobile radios in their trucks? Guess who rode along with the Guard to supply communications? Yep - hams (me included).

A helicopter from the Detroit police was needed for a search and rescue mission. The radio in the Detroit helicopter did not have the ability to operate on any of the Washtenaw County/Ann Arbor City frequencies. Guess who was picked to ride along to provide that vital radio link? Yep -a ham (me -although the mission was cancelled at the last minute).

In other words, don't be lulled into a false sense of security because the military 'has' a lot of communications gear and the police 'have' a lot of communications gear. If it isn't there or won't work on the right frequencies - it's worthless and an alternative is required. Usually, that alternative is amateur radio.

Most public safety/commercial radio equipment is restricted to at most a few assigned channels. What's more, channels in adjacent areas are deliberately assigned in a manner to PREVENT cross communication (to reduce/eliminate interference). But who has the radio equipment that operates on a _variety_ of bands/frequencies? Us hams, that's who!

No, hams may not be the 'lynch pins' of disaster communications, but they sure have proven (again and again and again) that they are a _highly important_ part of the overall scheme!

And of course it would be wrong to make Communicators develop the microwave bands all by themselves. The rest of us are needed to make sure it goes right. Also Communicators need to have some experience with 2 meters as well so they know what NOT to do.

> As the old saying goes, necessity is the mother of invention. But I'd

Compared to land mobile, 2 meters is deserted. Just try to get ONE frequency in the land mobile service for you fleet of 200 pizza delivery trucks in any major metropolitan area.

If people think 2 meters is crowded now, let then describe it to me in 16 years when 144.0-144.4 is the only ham band left above 28.8 Mhz.

MUCH, if not most, of the spectrum waste problems in 2 meters (and other bands) is CAUSED by these little turf holdings by some hams.

What is needed is some spectrum PLANNING. Many of the reasons that a repeater pair on a band is not available is because the happenchance location of repeaters is in many places for many frequencies spaced such that the geographical density is very low, yet they are often just close enough to make it impossible to slip a repeater coverage area in between 2 or 3.

Another problem is caused by the lack of use of CTCSS, anti-CTCSS, and other features to prevent mutual interference. Back when adding just ONE tone frequencey to an HT was expensive and difficult meant that few repeaters would use it. Yet even then it was commonly done on UHF repeaters to make a closed repeater. Today, you can easily and cheaply add a synthesized CTCSS tone generator, and most new HT's already have it builtin.

If you want exclusive telecommunications, get a cellular phone.

Repeater coordination should become repeater planning. This should also be done on 23cm IN ADVANCE. Repeater pairs for voice should be allocated to variously sized regional areas. All but a few allocations should require the use of CTCSS to access and the tone frequency specified as part of the allocation. Then the communities wherein each allocation is set up can determine (vote?) who/how/when/where a repeater is placed.

Closed repeaters have no place in a crowded band. I cannot see where they serve the "Basis and Purpose". If the band cannot take Communicators, remove the closed repeaters first.

The only reasonable thing to test for is the basics needed to access and
SHARE the radio spectrum. These areas need to be covered:
1. Rules and regulations
2. Operator procedures
3. Radio theory

Testing on computers, networking, television, astronomy, geodetics,
meterology, morse code, foreign languages, etc., just has no place
in determining whether or not one knows how to properly use radio.

> Let's enforce a uniform standard. If you propose a tough new exam with

Money is an indiscriminant filter. Perhaps you would be an excellent ham
and contribute greatly in some way, but money is filtering you. Doesn't
that somehow seem wrong? Some of the LIDs that make life miserable for
people on 20 meters have a couple of 10 KW linears feeding 3 inch hardline
to the top of a 500 foot tower where the stack of 4 6-element yagis is,
from atop their exclusive mountain retreat. Yeah, I'm exagerating just
a bit, but having money does NOT make one a GOOD HAM.

Here in Urbana-Champaign we have 4 2 meter repeaters and only 1 of them
gets any significant activity. It does get MORE activity than virtually
all repeaters in the major metropolitan areas. There are NO repeaters
on any other band. Fortunately if Communicators are limited to 220 Mhz
and up we would have a repeater on 70cm (almost have one now). But this
is still a somewhat larger city (100,000 population). There are so many
smaller places left that have between 0 and 1 repeater.

] Why oh why does everyone drone on about how wonderful amateur radio
]is in an emergency? This is the U.S.A., this country has the best
]equipped Emergency services and Armed services in the world. The U.S.
]Armed services even have their own phone network. Do you seriously

I have relayed air force inter-unit traffic on 14.325 because they
couldn't communicate on their own channels. Also White House
traffic.

]think that amateurs are the lynch-pin of disaster communications?
]
] In my cynicism I suspect the ARRL is behind this stuff. It somehow
]reminds me of NRA stance of "A high powered automatic weapon in every
]home will reduce crime".

[remainder of rather offensive posting deleted]

You understand the emergency aspects of amateur radio about as well
as you understand gun control! As one who has been involved in
a number of natural disasters (floods in Arizona, Mexico City earthquake
operating from Mexico City, Hurricanes Hugo and Gilbert, to name a few),
I can categorically tell you that amateur radio disaster communication is
valuable and, in some cases, irreplacable.

When the National Hurricane Center in Miami
needed the Hugo eye coordinates while it was in Charleston, they
didn't use all that high tech stuff, because IT DIDN'T WORK. Ham
communications, using ad-hoc, strung together at that moment networks, did!

When the earthquake struck Mexico City, ALL of the HIGH TECH
telephone systems went down (for long distance service). Amateur 20 meter
communications did not. Even the US embassy was reduced to communicating
on 20 meters.

When the British Navy needed to land a helicopter on the Cayman Islands following hurricane Gilbert, only ham radio was able to provide the communications between Warship Archer and relief officials on the island.

I wonder how much disaster communications you have worked. If you have, you know that when a disaster strikes, normal government channels become clogged with extremely high priority traffic. That leaves no place for important traffic of lower priority or which doesn't fit normal bureacratic channels. You would also realize that in most major emergencies, agencies that don't normally need to communicate suddenly have major coordination problems. This is why our Hurrican Watch Net has had hams, national guard units, US Air Force units, USGS, NOAO units and the British Navy all on frequency at the same time. We were the only people that could coordinate and talk to all units at once. This is not an uncommon finding - amateur radio provides a very good way to cross organizational boundaries.Finally, you would realize that in a widespread emergency, EVERY communications facility that is mobile or capable of emergency power operation is required.

]call out the fat guys with the walkie-talkies on their belts and
]obsolete police radios in their cars. They call up a cellular carrier

Now, let me mention that I don't believe that emergency communications is the be-all and end-all of amateur radio. Nor do I believe that hams are the primary resource for emergency communications. However, to deny the role that hams have, and to belittle those who do help, simply betrays your lack of understanding, not to mention your poor taste.

Is ham radio emergency communication important? You bet it is. Is it needed by every police department for everything they do? No way. Are all ham emergency communicators competent and helpful? Of course not! Ham radio has an important place in emergency communications, even with today's communications facilities. It also has its limits and its disadvantages.

Furthermore, you may be most interested in training or experimentation or whatever, but when you see or hear good things about ham radio in the mass media, I'll bet it is most often regarding emergency communications. I have had many TV, radio and newspaper interviews (in which I talked up ham radio as a public service) as a result of my hurricane net work [please - no flames - they called me, I didn't call them!]. They've never called about my work in direction finding or repeater controllers!

Probably to get access to the other repeaters their hear (about) but cannot
use. The 220 Mhz band is just not built up enough yet. That's part of the
reason we lost a big chunk of it.

> Out of those 10 Novices... all but one has now upgraded to Tech or above,

> time.

If the situation is such that 2 meters is all that you need, then there is
nothing wrong with everyone staying on 2 meters. If this were the case in
the whole country, I'd just petition the FCC to hand everything above 220
Mhz over to the land mobile service where it is needed. Where I live the
situation is pretty much the same. 220 Mhz is a wasteland. 440 Mhz is
barely sticking its finger above the water. 902 Mhz and up is virgin.

> Another person (I think it was Phil Howard.. sorry if I am wrong Phil) made

The hams who would have that attitude are the real scum, and if they get forced elsewhere or off ham radio entirely, I'd be SOOOO happy.

> Phil Karn's recommendations are especially apt *IF* we lived in a perfect

> these ideas working the way that he predicts. Thus I have to say that it
> is my personal opinion that the Communicator Class should be limited to 220
> and above.

It will fail there.

But let's look at it in different terms. Most people have been addressing the issue in terms of "entry level". What I would like to ask is this: "what justifies having a code test at all for access to 50 Mhz and up?" Why not just have a no code version of Technician by deleting the HF privileges and the code test?

Maybe we need entry level or maybe we don't. But what we do need is a basic way to access the amateur radio privileges without testing for anything that does not directly pertain to the privileges being granted. We've heard "gloom and doom" stories of what will happen to ham radio if we don't adopt a "no-code" license, but let me add one more for you: Imagine a COURT ORDERED set of rule changes that come about as a result of a law suit that is based on the fact that a code test unfairly disciminates. If that happens you won't have even a say in what the structure will be anymore. Let's clean it up and clean it up now before something really awful happens.

If you can come up with a way to revoke someone's allocation for an operating repeater that he'll accept, then I'm all ears.

Like it or not, that's a problem that _must_ be solved before you can redesign the frequency coordination system. If you don't believe me, I suggest you do frequency coordination your way for a while - and see how many repeaters you list as uncoordinated because they wouldn't change frequency and share one with another repeater, or go off the air, just because you told them to.

4437. Scanner information wanted (again)

Newsgroup: rec.ham-radio
Date: 1990-07-21 16:24:00 UTC
From: werner@vax1.informatik.fh-regensburg.dbp.de
Message-ID: <136
Source record: 10055

Hello scanner enthusiasts,

sri for reposting this question. I accidentially sent this question to the INFO-HAMS redistribution list at TAUNIVM so it might be missed by some of you. Sri again for cluttering the net. But now back to my problem:

I want to buy one of those new "gimmick-loaded" scanners; some years ago I owned a JIL scanner (26 - 520 MHz) and the AIR-8 (...that was a SONY :) but I sold them at a ham meeting (students sometimes need money).

After months of working hard I decided to buy myself one of those "toys" again; but the market is crowded and I wonder, which buy is the best. Well, what will I do with this scanner?

- receive LF-transmissions (weather fax) and RTTY (and maybe commercial services), if possible in all modes (AM, FM, SSB).

- use it as an ordinary radio (what a shame!)

- tune in to all those frequencies which you are not to allowed to receive over here in germany (public services etc.). It's a hard life here!

- monitor the amateur frequencies (6m, 2m, 70cm, 23cm)

- attach a scope to get a spectrum view around the current frequency

For the first purpose I thought about the SONY PRO-80. It has about the size of my good old AIR-8 and covers 150 kHz up to 108 MHz (115-223 MHz w. converter) and has all modes. Can anybody recommend this one? Is it a good buy? Maybe I'll use it as a secondary scanner sometimes...

Then I thought about the ICOM R1/R100. Although they miss SSB they've got an enormous frequency range.

It seems that the only scanner available that matches my needs is the R-9000 (ICOM), but the price is rather hefty!

Has anybody experiences with the AOR AR-3000 ? This machine covers 100 kHz up to 2036 MHz (continuous!) and has SSB, too (no scope, sri). and it is in the R-7000 price range.

What should I do? Can any kind soul help me with my decision?

I know, there's at least two scanner discussions a year in this newsgroup; maybe I'll post to comp.rec.ham.scanners.buyers-advice next time ;-)

Please drop me a few lines, tnx in advance.

ur Ralf

4438. Re: Cellular telephone as emergency service?

Newsgroup: rec.ham-radio
Date: 1990-07-21 16:43:02 UTC
From: rick@ameristar
Message-ID: <1990Jul21.164302.19756@ameristar>
Source record: 10043

In article <1990Jul20.175844.8030@ariel.unm.edu> ee5391aa@hydra.unm.edu (Duke McMullan n5gax) writes:
>What happens to the local cellular nodes when the fewmets hit the windmill?
>IMHO again, the service would go "suddenly and dramatically to hell" as
>dozens/hundreds of nervous folks tried to get on the air at the same time.

From the technical standpoint, the cellular equipment could be made sufficiently robust (probably more so than ham equipment since it would be funded from pre-taxed dollars) to ride through many types of problems. And if the upcoming digital/satellite modes free the dependence of cellular from the landline telco networks, then the service will be even more reliable in the face of disaster.

>So what really happens? Can anyone in the Bay area tell us what happened on
>the cellular links during the big shakeup a while back? Some of you must
>KNOW what happens to the cellular services in these situations. Would
>you be willing to share your tales?

The other interesting question is how amateur radio did during the bay area earthquake in terms of equipment availability, message flow, and congestion of channels.

Is preparing for the once in a century event worth the expenditure of billions of dollars worth of spectrum (eg wouldn't reusing parts of the land mobile bands during times of disaster be just as effective)? Equivalently, is all the spectrum allocated to amateur radio needed to fulfill the public service role (or would 3-4 mHz do)? It would seem that the public service role of any radio service is multifaceted, ie cellular radio operators reporting motor vehicle accidents are no less important to the cause as the amateur radio types who help out in natural disasters. IMHO, amateur radio shouldn't rely on any one source of political currency to pay for its spectrum allocation.

>
>And how many from hams through phone patches?

A much smaller number, I would say. Note that this 200,000 figure was
just for one (albeit big) state, and only for nine months. I regularly
scan a half dozen local repeaters on my daily commute in the NNJ area
and I'd say that I hear maybe one autopatch to the police every week at
the most. I'd be interested in seeing more scientific figures, perhaps
the League people on the net have them.

Bear in mind when comparing these figures that cellular phones currently
use about 40 MHz of spectrum, compared to the 69 MHz of spectrum between
30 and 1000 MHz that is currently allocated to the amateur service.

RTTY DX Notes, 1of3, 7/20/90

RTTY DX Notes for Weekending 20th June 1990.
Part 1 of 3.
BID: $RTDX0720

Looking at the logs for the ANARTS Contest, (by the way, have you sent your logs to 55 Prince Charles Road, Frenchs Forrest, Sydney 2086, Australia yet?) there appears to be a terrific amount of similarity or maybe redundancy in the RST reporting. Maybe that part of the message could be replaced by a number 001 etc. Or maybe his age, now thats a possibility. But the RST means nothing. There must be an answer, but what is it? It looks very stereotyped looking at a sheet of 599s. One wonders what other contest managers think about it? Maybe they would like to contact us at the above address to arrive at a better format. Please do.

Our thanks this week go to: I5FLN, I5ICY, I5IGQ, OD5NG, TG9VT, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your help with these notes.

RTTY DX Notes, 3of3, 7/20/90

RTTY DX Notes for Weekending 20th June 1990.
Part 3 of 3.
BID: $RTDX0722

QSL Information.

J39BS will QSL via WB2CLH.

5N0ETP QSL manager is his home call of N6QLQ, not N6QCQ as previously reported.

HK0BKX says to QSL via WB9NUL.

RB5QV gives Box 3, Melitovol 332301 USSR as his QSL address.
A41JW is OK in the 1990 Callbook.

Speaking of QSLS, VK9LI had over 400 contacts during his recent trip. (He was a one man operation.) He worked 277 different stations. Someone must have worked him more than once, HI. He worked 130 U.S. stations, and 62 Japanese stations. Cards have been received and sent for 126 stations.

Notes Of Interest.

ZK1WL is from the North Cook Islands.

Unfortunately there will be no RTTY from TI9 Cocos Islands this trip. But word is around that TI3DJT will go there in September and he will definitely have RTTY with him. Hope springs eternal.

Frankenstein. DA1WA will operate from Frankensteins Castle from 0800 on 4th August until 1900 on 5th August. RTTY will be used on all bands. QSL to the Wiesbaden Amateur Radio Club.

Iceland. DF2UU is expected to operate from Iceland TF, during August, with lots of RTTY.

GL DE DX1.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via AMTOR on the VK2AGE APLINK mailbox.

4441. Re: Qualification-based licensing

Newsgroup: rec.ham-radio
Date: 1990-07-21 18:25:37 UTC
From: brian@ucsd.Edu
Message-ID: <15961@ucsd.Edu>
Source record: 10042

What a load of crap.

There should be only two classes of ham license: one has a minimal code requirement to satisfy international treaty and allows operation below 30 MHz; the other doesn't. Both have questions on regulations, procedures, and technical matters to ensure that the applicant is competant to install, operate, and maintain a ham radio station.

Nothing else is needed!

If you want to hang paper on the wall or prove how good you are at passing exams, the ARRL will no doubt provide voluntary technical and operating exams, just as they currently provide code proficiency certificates. The people who want them will jump through the hoops to get them and the rest of us will do whatever ham radio means to us.

Incentive licensing sucks hard. Let's abolish it.
- Brian

I'm glad to see some support for a very basic system of amateur radio licensing. I had not wanted to post it myself (though I do plan to put it in my comments I am working on) simply because someone would have assumed that it was an attempt on my part to get free HF privileges since I already have a Technician class license.

Really only ONE class of license is needed: Amateur Radio

But I am not proposing to violate or change the international agreements on Morse Code ability to access HF privileges, so we will have to put up with TWO classes: Amateur Radio & VHF Amateur Radio

But I do like the idea of some group like the ARRL sponsoring prestigious certificates on technical ability.

In article <1990Jul21.180642.27463@bellcore-2.bellcore.com> karn@thumper.bellcore.com (Phil R. Karn) writes:
>Bear in mind when comparing these figures that cellular phones currently
>use about 40 MHz of spectrum, compared to the 69 MHz of spectrum between
>30 and 1000 MHz that is currently allocated to the amateur service.

This is not a fair comparison. There are many other modes of communication employed in the amateur spectrum, than just FM voice repeaters. If we examine the ARRL band plan, we find:

Band	Spectrum for FM voice repeaters (inputs and outputs)
6 m	2 MHz
2 m	2.23 MHz
1.25 m	2.08 MHz
70 cm	6 MHz
33 cm	6 MHz
Total:	18.3 MHz

I do not voice a comment on whether this amount of spectrum for FM voice repeaters is too little, just right, or too much. I'm sure I know what Phil thinks. I do agree that spectrum has to be set aside and allocated for all special interests.

RE: Repeaters

On 21 Jul 90, phil@ux1.cso.uiuc.edu [Phil Howard, KA9WGN] writes
-
- Another problem is caused by the lack of use of CTCSS, anti-CTCSS, and
- other features to prevent mutual interference. Back when adding just ONE
- tone frequencey to an HT was expensive and difficult meant that few
- repeaters would use it. Yet even then it was commonly done on UHF
- repeaters to make a closed repeater. Today, you can easily and cheaply
- add a synthesized CTCSS tone generator, and most new HT's already have it
- builtin.
[...]
- Closed repeaters have no place in a crowded band. I cannot see where they
- serve the "Basis and Purpose". If the band cannot take Communicators,
- remove the closed repeaters first.

This is something that has always puzzled me. When I was studying for
the exam, I kept reading about how no one amateur owns any particular freqs
but how repeaters effectively own freqs on a first come - first serve basis.
Maybe what we need is for closed repeaters to have the lowest priority for
frequency planning purposes. In other words, if somebody wants to put up an
open repeater on a pair occupied by a closed repeater, the owners of the
closed repeaters would have the option of opening their repeater for use by
any ham or losing the allocation.
Now, I expect some folk to complain about my views. [Heck, this is a
case where I want feedback.] Some folk will say that requiring certain
tones before the repeater opens frevents unwanted interference. Well, I can
understand this and think that if you use DTMF tones [available on most rigs
or can use a hand-held `pocket dialer' from Radio Shack] and you make it
public knowledge which DTMF keys are used, then your repeater is effectively
open and should be considered so. But when folk start using secret sub-audible
tones for their `private' repeater, then that repeater should be considered
closed and have low priority for the purpose of `owning' frequency pairs.
Some other folk will say that since CLUB X finances the repeater, only
members of CLUB X should be allowed to use the repeater. Fine, that should
be allowed. But if CLUB Y wants to have an open repeater and the Frequency
Coordinator says "sorry, no available frequencies free", then CLUB Y should
be allowed to put their repeater on the freqs that had been used by CLUB X's
repeater, which will come off of the air. Clearly, an open repeater will
serve the community better than a closed one . . .

--**-- --**-- --**--

RE: Communicator Class

Whether one likes it or not, the Communicator class will be created.
I think that the issue is now how to do it right. On one hand, we have
the FCC saying, "Six license classes too much. Kill novice <grunt>" and
the ARRL saying, "Oh No! Please don't kill the baby. <weep>" and not
much interaction between the two to settle it with the least ruffled
feathers. I know I'll get flamed for my comments, but I'm in Houston and
I can take the heat! ;-)

My proposal:

License Class: Novice
Exam elements required: 1a and 2 [5wpm]
Privileges: Current Novice privs

License Class: Communicator
Exam elements required: 2, 3a, 3b [no code]
Privileges: All amateur privs above 30 MHz, no privs below 30MHz

License Class: General
Exam elements required: 1a, 2, 3a, 3b [5wpm !!!]
Privileges: Current General privs

License Class: Amateur Extra
Exam elements required: 1b, 2, 3a, 3b, 4a, 4b [13wpm]
Privileges: All amateur privs

Notes: A 20wpm code test [element 1c] is no longer necessary
for any amateur license class.

Upon expiration of their current license, all Technicians
who have credit for element 3b will become Generals, all
techs w/o such credit will become Novices [indefinately
retaining credit for element 3a, so only 3b will be needed
to upgrade to General] and all Advanced will become
General [retaining credit for elements 1b and 4a, so only
4b will be required for upgrade.] Current General class
licensees retain credit for element 1b.

All exams will fall under the VEC exam structure.

Communicator calls will come from Block D.
Amateur Extra calls from Block A, or Block B
when all Block A calls have been assigned.
Current Technicians and Advanceds who `downgrade' upon
license expiration WILL reatain their calls unless they
desire otherwise.

--- --- ---

OK, I'm ready for flames. But before you Technicians flame me,
remember that I'm a Tecnician Class licensee.

- Jordan, n5qvi

>Mark Bitterlich

I think your conclusions are wrong for several reasons. If we get the
numbers of Communicators necessary to really make two meters congested,
they will OUT NUMBER the OLD FARTS and will be in no danger of being
ostracized and treated like unwanted scum. I doubt that we will really
get hundreds of thousands of new Communicators right away however, and
think that the newcomers need the guidance and socialization provided
by being at the "watering hole" and not in some ghetto where they would

be free to develop bad habits that will surely migrate to the lower bands as their numbers increase.
In the few large metro areas where two meters is filling up, we are already being "forced" to move on up to find room for our experimental work. In general, the most active and most knowledgeable are the ones moving up first. This is as it should be since unexperienced hams would be much less likely to be sucessful in breaking new ground. If all you want is more outdated FM voice repeaters being used by applicance operators then restrict Communicators to 220 and above. If on the other hand you want to see new and innovative development to populate the upper bands, then let the Communicators have the communicators band; Two Meters. Those who are technically inclined and are attracted by the Communicator License (horrible name IMHO) will join the pioneers upstairs.

Total: 30.3 Mhz

In fact the 23cm band is likely to far surpass the 33cm band for this mode
because of the dominance of Japanese imports designed for the ham market.

It seems that many city and county emergency departments (officials, such as police) are getting lots of cellular phones. This is great if they have some way of giving priority to their phones, and if the cells remain up, and if the land line from the cell keeps working.

Last October:

I live in San Mateo, a not so huge city half way between San Francisco and Palo Alto. The city's emergency generator went out after about an hour. This powered their comm facility which included 911, and covered this city and a few surrounding ones. I understand that the cellulars were almost useless since EVERYONE was trying to use them.

At that time I was at home waiting to see what help was needed. Via 2M I reported this loss of power to the power company. I think there was also some other probelm that the phones weren't working at the police either, but I might be wrong.

So, all in all, I feel that the officials are getting into the cellular equipment which is fine. In many emergencies this is great, portable access to the phone system to the rest of the world. However, I expect these same officials might be easily tempted to rely too much on them for upcoming major emergencies.

A repeater can be OPEN my making it's CTCSS/PL/"subaudible tone" publicly known just as much as they can by making the DTMF access codes publicly known.

In fact it could be useful for a repeater to have both features, including a publicly known DTMF code to disable the CTCSS feature (until 1 minute of inactivity when it will be restored) for the (now getting rarer) ham who has neither capability.

>
>A while ago, I heard about the AOR AR1000 hand held scanner with
>continuous coverage between 8-600 and 805-1300 MHz. Does anyone
>have one? How do you like it, etc...
>

I just got one about 4days ago. I really like it. The 10 banks of 100 channels
(that's right 1000 memories!) are really neat. I put police type stuff in one,
put aero in another, put handheld telephones in another, news stations in yet
another, and I am still trying to figure out what to put in the rest.

As far as reception goes, on its rubber ducky it does a bit worse than my
Pro2005 on its Channelmaster Monintenna. I notice the biggest difference
on weak stations as expected. As it comes, it has cellular coverage, but
of course I would NEVER listen to that service (heard any good stock tips
lately?).

As far as features go, it has the ability to lock out any channel or bank
in scan mode. You can program 10 different search ranges. You can set the
frequency step size to any value between 5khz and 995khz. It also has
a tuning Knob, a feature I really like! It has a built in light for
illuminating the Liquid Crystal Display. It picks up AM, FM and wideband FM
modes and does a pretty good job with standard FM broadcast band (music).

Now on to what I don't like:
The SW reception is not very good on the rubber ducky as expected. It does
an OK job with a real antenna, but you're not going to be able to step
out to the parking lot at lunch to catch Radio Baghdad! If an RF booster
(preamp) was added in the below 30mhz bands, I think the SW reception
could be brought up to par with the portable Sonys (like the SW20).
The speaker is mounted toward the bottom in the front. This makes it
feel a bit strange when holding it up to your ear in a noisy environment.
The Nicad charger that come with it only supplies a puny 200mA which
means you can't listen to it with very weak batteries while charging
(BTW my batteries that came with it were very low out of the box).
I've been using it so much, that I really haven't taken it out of use
long enough to charge the batteries. So I've been running it off of alkaline
batteries which works great.

I was really hoping to get an Icom R1, but got tired of waiting, so I got
the AR1000. After reading the specs of the R1, I'd still like one, but
it really ought to have 1000 memories like the AR1000.

One final note, if AOR included a serial port for loading/dumping the
1000 memories, it would be much easier to program. Also, yes it

does have a lithium backed memory. So when you change batteries, you don't have to re-program.

Having a full featured handheld like the AR1000 has really opened up the world of scanning for me, I find that it goes everywhere with me. As Karl Malden says, "don't leave home without it".

was arranged differently (like higher up) it would feel more natural when holding it up to your ear. An RF booster for improving

Last year I tried to get the AZ frequency coordinating committee to refuse
to coordinate closed repeaters. The vote failed (lots of Cactus members
on the committee). This year (next Saturday), I'll try again.

As far as I'm concerned, one can put up a closed repeater UNTIL someone
wants to put an open repeater on the same frequency. Then, the closed
repeater should either become open, or go away.

On another note, I am a member of a club (Arizona Repeater Association)
that has a corporate by-law prohibitting it from owning closed repeaters.
Unfortunately, the tech committee has been unable convince the non-technical
board of directors that putting PL on a repeater, and publishing the PL
frequency, does not make a repeater closed. Sigh. Lots of intermod.
We were at least able to get permission to add PL to a repeater in
such a way that a PL'd signal gets "increased sensitivity." This really
means that we cranked the squelch all the way closed for carrier only
signals, and bypassed it with a PL decoder. This helps a bit.

Finally, let me point out that FCC regulations do not prohibit anyone
from using closed repeaters. In fact, as far as I can tell, the ONLY
way a repeater owner can stop you is to conceal the PL (easy to discover)
or use crypto controls. They MIGHT be able to sue you, but is it worth
it to them? Maybe we should all just go ahead and use closed repeaters.

Well... the term "Old Fart" is really starting to get to me! I think
that it is now being stretched to include anyone that does not agree
with the currently proposed ideas for licensing. So I think that I will
coin a new phrase... "NEW FARTS" ... all the new Communicator Class
operators and no code people are now "NEW FARTS". Now we will have
Old Farts, and New Farts, and just plain smelly Farts and when someone
reaches for the chain on the toilet... we will ALL be in trouble! :-)

Seriously though (all Farts excepted) you make a good point.

>In the few large metro areas where two meters is filling up, we are
>already being "forced" to move on up to find room for our experimental
>work. In general, the most active and most knowledgeable are the ones

Ummm, I don't know about that. New hams are full of force and vinegar
in a lot of cases, and being exposed to the people that really are the
movers and shakers could be just what is needed. Two meters in many
parts of the country is the band that has the most controversial
behavior. Are these the people that you want teaching these new
hams? There still remains the problem of NO REPEATERS above 2 meters
in many parts of the country, and for that I have no answer...

>If all you want is more outdated FM voice repeaters being used by
>applicance operators then restrict Communicators to 220 and above.
>If on the other hand you want to see new and innovative development
>to populate the upper bands, then let the Communicators have the
>communicators band; Two Meters. Those who are technically inclined
>and are attracted by the Communicator License (horrible name IMHO)
>will join the pioneers upstairs.

It seems we are worried about the same things! I do not want to see the "Communicators" put into a go-no-where position, and I believe that dumping them onto two meters will do exactly that. I fail to see where putting them on 220 and above first, will cause what you predict to happen. If they are technically inclined, then they will get with the movers and shakers and start their own work... if they are not, then they will just use what is already there. If there is nothing there already, then they will just lose interest and go away. If they start inundating two meters, then I suspect that a lot of things will happen, and very few of them good.

I guess it depends on what you are looking for. If all you want is a tremendous influx of new hams, then offer them 2 meters, give them a simple written test (and no code requirement), and then (IMHO) more than likely you will achieve that end. If you are looking to attract people that want to come into the hobby in order to help build it, then consider putting them with the people that are already doing that, and from what you have said it appears that we both agree that such people are to be found ABOVE the 2 meter band.

The real problem is finding a common ground on what we all really want. Is it a lot of new hams? A lot of new YOUNG hams? A lot of new hams (probably not real young) with technical talent? Some kind of blend of all the above? A wide open uncontrolled development? It seems that everyone has their own ideas of what it should be and it sure makes for some interesting reading doesn't it? Just for the record, I am one of the ones that want to see people coming into the hobby that want to learn about the technical aspects and contribute towards its development. I am not gainsaying the other aspects of the hobby... it just seems to me that "technically" we are losing ground more rapidly than any other area.

Thanks for your reply Gary!

Yes, I'm afraid so! I did NOT make this up. In the last presidential campaign Wayne announced his candidacy for VP of the U.S., and he did NOT have a presidential running mate! If you check out his editorials in 73 at the time, he had all these "great" ideas to "get this country RUNNING again" (maybe like Lyndon LaRouche and his "full mobilization" plans?).

He claimed at news conferences in New Hampshire (remember that there is an important primary in his home state) that he was a succesfull businessman, engineer, etc, and he had some ideas about improving education and global competetiveness. I think part of the reason that his old cohorts published the book was to refute some of his wild claims about himself, which were not being questioned by the media.

4456. Changing Traffic to Emergency Areas

Newsgroup: rec.ham-radio
Date: 1990-07-22 18:41:16 UTC
From: mahler@rouge.usl.edu
Message-ID: <11950@rouge.usl.edu>
Source record: 10059

I have tried to put these thoughts into a standard prose proposal, but find its too long, and boring ... I hope the following lists of points express my proposal.

KF5VH Proposal for Traffic in Emergency Areas

by Steve Mahler, KF5VH

Review of traffic types (order of importance):
Emergency / SOS - loss of human life may occur
Priority / PAN - human injury/suffering or great property loss
Health and Welfare - Inquire or reply of conditions
Routine - any other traffic

Recent Events
Hurricane on east coast and Earthquake on west coast

New Developments
Packet Radio and BBS provide a capability to move between 10 and 100 times the traffic we could on CW and voice message nets.
Broadcast radio and TV now can cover most events "live", this means the generation of traffic into an effected is very time compressed.
To some degree our efforts to promote Ham Radio as emergency communications has been successful, so more non-hams are making requests for H&W traffic.

Result of New Developments
We can now move more Health and Welfare traffic into an area than the local hams can resolve and reply to.
Each H&W message into an area generates:
1) a message in
2) a delivery
3) a possibly message out or an undeliverable message

I recall the message numbers from the earthquake were on the order of 10,000. That means 10,000 in-bound, 10,000 ham deliveries, and at least some of those replies.

Consider
Maybe those directly involved will comment, by my guess is that at least 90% of the reply messages were "ALL OK HERE". It appears that considerable effort is expended for little gain.

Proposal
Add a new class of message:
Request for Aid or Comfort / RAC - request from effected area (or reply)
This message would originate in the emergency area, and be a request for assistance by an person with a need.

The new priority order SOS/PAN/RAC/H&W/Routine

What will this improve?
Messages for aid will move more quickly.
The scare resource of hams will be able to concentrate on
those people who really need help. Hams can collect RAC messages
from on-site locations or emergency shelters (or any other announced
location).
Better control of message tracking and delivery because of fewer
messages.

What will be required to implement ?
Agree that this method may help.
Initially restrict incoming traffic to SOS, PAN and RAC until time
and resources permit H&W and routine traffic.

Your comments and discussion are desired and important.

73's ... Steve, KF5VH

> Yes they do. Cel Tel doesn't cover the world (yet ;-). Communicating
> anywhere in the world ?? I thought that was what HF was for ;-)

Let me see now. I have a cellular phone and I want to talk to
the Red Cross HQ in Switzerland. I don't have the phone number at
hand, no problem. I dial the AT&T operator and ask for "Switzerland,
Geneva, International Red Cross." In no time at all I will have the
number. Then I dial 01141-114122 and talk directly to the biggies in
Switzerland.

Communicating anywhere in the world with anyone at anytime?? I
thought that was what telephones were for. AT&T gave up using HF to
communicate around the world some time ago. Since that time
international traffic has exploded. This is the 1990s, lest we
forget. Even Western Union no longer exists.

Want to get DXCC without having to put up with bad manners,
expensive equipment, TVI and and years of waiting for the QSL bureau
to come through? Get the N6ARE DXCC with the AT&T endorsement.
Telephone 100 countries (cost roughly $3.00 per country) and your
itemised phone bill is confirmation. Yes, you can get the mobile
endorsement too by doing it again from your cellular phone. Coming
soon DXCC with a FAX endorsement.

Yours still waiting for the penny to drop.

4458. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-07-22 20:26:34 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9007222031.AA23972@ucsd.edu>
Source record: 10061

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

What's the opinion on the AOR AR3000? Should I wait for an ICOM
IC-R1 or IC-R100, instead? (are these two ever going to be sold in North
America?)

Thanks, in advance.

> they wanted to.
>
> This isn't the technonerd utopia, but the real world. If you want people
> to be more than mike-button jockeys, you gotta give them a reason to.
> Incentive licensing works quite well.

Incentive licensing made a few hams study (memorize) and go pass some test without understanding what they were even doing. No, incentive licensing did NOT (for most hams) achieve anything. Maybe, just maybe, better tests along with I.L. could have done it, but I'm not going to waste the NEXT 20 years trying to find out.

The button-pushing mike jockeys are just going to be button-pushing mike jockeys and that's that and we will just have to live with it.

Ham radio tests do NOT need to be deeply technical to be applicable. Sure, basic radio theory is needed to operate a rig RIGHT (such as understand that sidebands really do take up spectrum). The test does NOT need to determine if you can BUILD a rig; it should just make sure you know enough to not mess up other users of the sprectrum when you push the button.

But the tests themselves need to be well designed to make sure that no one slips through the cracks AND at the same time be fair so that it lets through anyone who can be a good ham in any interest area.

Only the BASICS need to be tested, but they need to be tested WELL. No special interests need to be tested on at all. Not packet, not ATV, not Morse Code. If you pass a well designed BASIC test, you will have the knowledge you need to deal with the special cases.

To Mark Bitterlich WA3JPY, with copy to all...:
I've noted your generally intelligent comments on INFO-HAMS. You recently proposed three reasons for wanting lots of new hams. One of them is that numbers are the most important thing (to paraphrase).
The conventional wisdom is that the most important factor in keeping the bands is that the NUMBER of hams must be greatly increased. That is said to be the reasoning behind the ARRL and FCC proposals. In today's world, they say, numbers are all - people vote, we need more hams.

I can't agree that it will work. More may be useful, but more hams on two won't do much to show need for the other VHF/UHF bands. The concept that crowding on two will cause a shift to other bands seems as likely as saying that crowding on 20 will cause a mass shift to other bands.

I've done some VERY rough estimates of the number of new hams needed to make ALL the bands from 50 to 1300 MHz busy at the PEAK HOUR of the PEAK DAY of the week. If ALL new hams operated on these bands, the number of hams in New Jersey would have to triple, and the number in Indiana would have to increase 13 times.

I don't expect ALL new hams to operate on these 6 VHF/UHF bands, and I don't expect the number of hams in Indiana to increase 13 times - or to triple in New Jersey - without a basic change in the concept of amateur radio.

Any commments or suggestions?

Bob W3OTC

Not exactly, in most parts of the country there is currently
very little activity above two meters. By dumping the newcomers into the
wasteland they will either fail or more likely form their own CB-like
clubs to support their new repeaters. By ghettoizing them this way they
will not receive the socialization needed to become mainstream hams.
When I mentioned pioneers moving up frequency in my previous posting,
I carefully noted that this is only happening where two meters is
filling up. In most parts of the country this is not the case yet.

>"technically" we are losing ground more rapidly than any other area.

I personally want several things from this restructuring but, primarily I want fairness. I admit that I am still bitter about 1968. I can never understand why I was required to demonstrate faster CW operation in order to regain some of the voice frequencies I enjoyed prior to 1968. In my opinion incentive licensing has been the biggest disaster for amateur radio. It created a divisive caste system that haunts us to this day. I want to bring hams back together instead of creating a new class of untouchables.

I also want to see a lot of young hams come back into the hobby. As Phil Karn said, ham radio has been the start of a lifelong interest in electronics and high technology in general for many people. I count myself as one of those. I want a new generation of twelve year olds to experience the magic like I did.

As for technical folks, I expect that they will be represented among the newcomers in about the same proportion as they are in the current ham population.

Now that's a load of crap! Creating a CW speed based caste system has really turned amateur radio into something that is advancing the state of the art hasn't it. Why just look at SSB, uh sorry developed by the mike jockeys prior to 1968. Well how about FM repeaters, nope pre-68 again. Packet, yeah that's the ticket, hmm, it says here that most of the packet guys hold TECHNICIAN tickets. Maybe you are right Jay, it seems that incentive licensing has caused the cw speed freaks to cling to the lower 25khz of 20 meters and GET OUT OF THE WAY OF THOSE ADVANCING THE STATE OF THE ART.

A problem I have is never knowing when to expect mode JA to be on. With
FO-12 we sometimes would get a mode schedule for the satellite.
Is there such a schedule for FO-20? It is very frustrating to play the
chances and find the satellite off, or in digital mode.

Here in the Santa Clara (Silicon) Valley, ARES/RACES is quite well organized.
I think it has something to do with the fire dangers we have every summer.
We were only a few miles from the epicenter of the Loma Prieta quake.

Most communication was done via 2-mtrs. Emergency networks were in place
within minutes after the quake. Communications were between county offices,
shelters, ARES groups, and other official and not so official organizations.

The problems were mainly with H&W traffic into the area, but that is a
subject for another discussion (and one of my hot buttons).

Overall, the hams trained for emergency communications did their jobs quickly
and effectively. Would we have been in trouble if there was not a corps of
trained hams? You betcha!

I have a commendation certificate from the ARRL hanging on my wall. It was
given to me in recognition of the work I did during the quake. The time I
spent was no where near the hours and hours given by other volunteers.

It is one of my most prized possessions.

>thanx, doug

Doug, I have had the opportunity to see the insides of one cell site... it runs on lead-acid stationary type battery bank. The bank is kept on a maintenance float charge with regular equalization charges. This is the "UPS" system that is typically used. Invertors are used to boost the battery voltage and convert to AC for special loads. The whole place has a full HVAC system for temperature control and intrusion detectors for security...all monitoring is done over the microwave link.

Bill, N0LAJ
P.S. the site engineer told me they could run for 24 hrs. on batteries, if the outage went longer they bring in a portable generator and plug it in to a receptacle on the side of the building.

Bob, in trying to keep the tension down, I was writing a list of some of the more common reasons that I have read for establishing the Communicator Class and what privileges they should have and why. The list that you are paraphrasing did not necessarily mean that I (personally) supported any one of them over the other. Actually I was just trying to point out the varying thoughts that have been posted by others and that it is hard to say how we should get to a goal when we really haven't totally agreed just what that goal should be! :-) This is not a flame nor even a correction, just a slight clarification.

>I can't agree that it will work. More may be useful, but more hams on two
>won't do much to show need for the other VHF/UHF bands. The concept that
>crowding on two will cause a shift to other bands seems as likely as saying
>that crowding on 20 will cause a mass shift to other bands.

And I PERSONALLY happen to agree with you 100% !!!! More than 100% if that is possible! That is why (IMHO) I do not get a warm fuzzy feeling about giving the Communicator Class Two Meter privileges. I am worried about them "parking the car" on 2 meters from now until the end of time. I am also worried about how they will be treated by others on that band. There are a LOT of nice people there, but I am worried about the 1 jerk that could really affect their perspective of Amateur Radio. Sure.. there are nasty people all over... but there seems to be a concentration of them on a few bands over others... and on VHF/UHF, I believe that happens to be 2 meters. There are a LOT of VERY GOOD logical/moral arguments for allowing them on 2 meters, however regardless of the great points being made I just have a hard time buying off on it. Trying to force hams on 2 meters to develop other (higher) bands because of the possible congestion caused by Communicators is ... well.... in my opinion a VERY BAD idea. Phil Howard originally wrote this, but in private conversation I found out that he really didn't mean it quite as it sounded. (Correct Phil?)

>I've done some VERY rough estimates of the number of new hams needed to

>you be willing to share your tales?

I can give you two observations about CellTel during the earthquake.

The cell which covers Los Gatos was out of action for at least the
first 24 hours after the quake. Land line service was also down
or intermitant during the same period. Los Gatos is fairly close to the
epicenter, and experienced the worst damage within Santa Clara
County.

There was a fairly large collection of CellTels at the Oakland EOC
(Thats Emergency Operations Center) and it was damn near impossible
to get a dial tone for about a week. This wasn't due to cell failure,
but rather overloading the system. There were a greater number of phones
in the area than the cell could handle.

>

Having been involved in a small way with the goings on here in
Seattle, I got to talk to some of the /WG contesters the morning after
the contest. Guess what: they hardly worked any JA's at all.. The
highest qso-total team (over 1300 QSOs) only had a couple of
dozen JA QSO's. One of the other teams (the Brits, I think), didn't
talk to ANY! *Everyone* was asking: "where were the JA's?" Propagation
condx were generally mediocre to poor, with Europe only coming in
during the last 2-3 hours. The handful of JA's I worked during end of the
contest all had very low serial numbers, most below 100. Yup, stateside
contacts were the bread and butter of the contest.

Still, everyone had a blast.. the competition was fierce, yet friendly,
and the opportunity to meet so many famous call signs face-to-face was
humbling, to say the least...

Rick,

In California major earthquakes aren't once in a century. I've
personally experienced the Sylmar quake of 71 and the Loma Preita
quake of 89. That doesn't include the Coalinga quake, and
Whitier quakes. Thats more like once every 5-6 years. (Just
putting this in proper perspective...it really doesn't have
much bearing on Rick's arguement or mine..)

You ask whether billion's worth of radio spectrum should be
tied up for a once-in-awhile event....Hopefully, there are
other reasons that ham radio should be supported by the
US government(see the basis and purpose in part 97 for
their current justification.) What I would say is that
emphasizing this aspect of ham radio to JQ Public is smart
public relations...this is one activity that the general
public can relate too and appreciate.

The contributions of other services shouldn't be ignored
but rather enhanced. Current state of affairs being as they
are though, ham radio is in the best position to help. We
have both local and national organization whoose goal is to
prepare ourselves. We have varied spectrum capability

so we can respond with a variety of capabilities. Need long haul comm...no problem...Need to tie two different organizations together on a common frequency...no problem. Need radio coverage into the back country...no problem. This capability has two different aspects to it...we have more frequency capabilities than any individual agency, thus more bandwidth that can be employed during disasters. On the other hand, some of our capabilities are directly related to the spectrum we have, i.e. long haul communications versus point-to-point employ different chunks of the spectrum nominally. So to provide the service as it currently exists we do need a pretty good choice of available frequencies.

Another major point that people neglect that ties directly into Part 97 requirements for ham radio involves the capability of setting up and operating this hardware under any required condition. This ability requires some technical expertise. I can't think of any other radio service which is prepared in this manner. (Now they may exist...I just honestly don't know of any off the top of my head)

Hi Phil,

I'd guess we handle around 10 calls a day minimum on the 6.115 repeater here in San Jose. (Patty can correct me if I'm off by a large amount ;-) I went through a quick exercise to try and guess what kind of numbers we do generate..... using pretty conservative figures I'd guess between 30,000 and 50,000 calls a year to CHP and other agencies. This isn't 200,000....but it isn't an insignificant number either.

I would like to add a frequency converter to my IC-R7000
so I can listen well below 25 MHz (or whatever its lower limit
is, exactly). I've heard of several commercial up-converters,
but I wouldn't be adverse to building something, either.

Recommendations?

I understand that for operations below 30 Mhz the ALL amatuers
are required by ITU regulation to pass a code test.

1. Does anyone have the text of that regulation ?

2. Does it state in the regulation what the minimum speed
required is ?

3. If the regulation is so well enforced how does the CB world
exist in the US under that ITU requirement ?

Welcome to the world of Amateur Radio (even though you havn't got your license yet!)...

My input to the learning of Morse code is the following:

Practice copying code at least every day. This can be in one or many short sessions (10-15 minutes each), or one long

do-it-for-as-long-as-you-can-make-progress

session. The idea is to get as much practice COPYING code, as you can. Of course, you have to judge for yourself how quickly you want to earn your license. Of course, don't over do it!!! It doesn't do you any good to burn yourself out trying to copy for 1 hour a night, if your head can't stand it!

When I say "copy", I mean writing down each character as you hear it. Listening to a tape (or computer) without writing down each character can help, but SHOULD NOT be a substitute for your written practice. Some will tell you to learn to copy in your head, which is great for normal operating, but this probably will not help you pass the code exam. Remember, the code exam is a written exam! If you can remember 5 (five) minutes of details UNDER THE PRESSURE of an exam, then copying in your head, and jotting down notes will be ok for you (but I doubt that many people can do this).

If you have access to a receiver, then try and copy some code off the air, use the W1AW code practice sessions, or other clean copy that you find. Don't spend too much time doing this (playing with the radio), unless you find code that you can copy at 50% or better.

This information comes from my experience as an instructor of Novice classes, and as a Volunteer Examiner. I have seen many people try to use the various "new methods" to copy the code. They work for some people, or help those who have difficulty with the "standard" methods. But MOST people are distracted by these 'so-called easy methods', looking for an "easy way out". If you put the effort into copying code, instead of these "tricks", you will end up

learning the code, and forming a good base for increasing your codespeed later.

Good luck, and I hope to hear you on the air some time soon!!

The birdies could be picked up at any of several stages in the
radio, where the hetrodyning frequencies are not exact multiples
of 2 MHz. Thus, with images, you could expect the birdies not
to appear nicely at 2 MHz intervals.

Quite true. PL on open repeaters has long been standard practice on 2m in some areas (e.g., Chicago, where summertime tropo openings are extremely common) while other areas (e.g., NYC) resist it.

I once listened to a knock-down drag-out fight between a user of the 146.895 system in Morris County, NJ, and a user of a repeater on the same pair in southern New Jersey who kept bringing up the Morris system in advertently. The southern NJ ham was not so strong that he could not be overidden by any local user of the Morris machine, so the use of PL could have prevented the problem entirely. What a pointless argument.

The proper way to use PL is to assign a common tone frequency to all the systems in a given area, and to assign different tones to each of the other, nearby metropolitan areas where the RF channels are reused. This way, those using the systems in a local area need use only one tone frequency. That makes it easier to use rigs with add-on PL generators that can't store a different PL tone for each channel.

```

A packet message this morning (from N4DW as relayed from KR7G) had this info:

K1AR/K1DG team made 1435 QSOs
W9RE/K7JA team made 1385 QSOs
OK team third place, no QSO total given.

I'm sure I got the team info correct, but maybe the numbers are off a little. My packet connection is flakey right now.

I made about 340 QSOs from W1MX (MIT Radio Club Station) in a few hours of operation. I was amazed by the activity. Half of them were on CW, and the keyer was gone, so I battled it out with a straight key.

That works for me. At this point, i've come to the conclusion that all
you need to know to be a ham are a few rules, such as bands, bandwidth,
power regulations, etc. These days, the only technical stuff you need
is the ability to find the power switch, and the ability to press a PTT.

Things like the OSI model of network comm, preamp circuits, propigation
methods, etc, have nothing to do with whether you can keep youself
out of trouble. All that counts is that you use the right bandwidth,
stay within your band, and dont do things like swear on the air, etc.

>(on average), they ALL have relativly simple equipment requirements
>and they ALL have resident hams within easy distance over most of the
>country.

This is _NOT_ a flame. It is intended to try to educate ...

I can't speak directly for 220, because I haven't used the band, but 144
and 432 are dramatically different!

+ Sporadic E is almost non-existant on 70cm
(I've never even heard of it on 70cm.)
+ Meteor Scatter is much easier on 2m
(I've worked more than 150 contacts on 2m meteor
scatter, while only 7 on 70cm.)
+ Often, Tropospheric ducting is far superior at 70cm
(I've seen a band opening from 70cm and up where I was
working folks in southern Georgia and Alabama, and in
Florida, from Grand Rapids, MI, for more than 4 hours,
when 2m was stone cold dead!)
+ With similar antenna size, receiver noise figure, transmitter
power, and bandwidth, there is an advantage to going higher in
frequency because antenna system gain goes up as f^4 while path
loss goes up as f^3.
(I was always able to work a guy in south-eastern WVA
from western MI on 70cm, but we never made it on 2m. We
both had ~100W on both bands, 2 stacked 15' boom
antennas on both bands, similar preamps and feedline on
both bands, and worked CW. When I say always, I mean
that it was an everyday occurance that I could [and
often did] work him on 70cm.)
+ Moonbounce may be easier on 70cm because of the ease in building
antennas of high-enough gain. I'm just guessing, talk to an
experienced EMEer to find out for sure.

Conclusion: If you only consider NBFM, then 2m and 70cm may be so
much alike that you can't tell them apart. However, if you
consider narrowband modes, where you can really tell what kind
of propagation is happening, then 2m and 70cm are so different
that you would never even think of making such a statement [that
they are much alike].

4485. Re: Ham radio's value (Was: Re: Communicator Class)

Newsgroup: rec.ham-radio
Date: 1990-07-24 00:05:29 UTC
From: peter@Pacer.UUCP
Message-ID: <326@pacer.UUCP>
Source record: 9943

A few thoughts on the Communicator controversy. My own background: 36 years old, ham for 21 years. That makes me *both* a fairly young ham and an old-timer, demographically speaking. :-) I passed my Novice and Advanced in 1968-69 when there were only two questions on *transistors* on the exams. Got my Extra in 1984. I don't consider myself a techno-whiz, but I am reasonably technically literate.

Many countries have a no-code license, and it hasn't destroyed their amateur services. International regulations say that one must know CW to transmit below 30 mHz. I think that's wise, for reasons I will state in a moment. But for above 30 mHz, no such restriction applies.

Since one can currently have all VHF+ priviledges by passing the Technician exam, it's only fair to allow a Communicator access to all VHF+ bands as well. After all, he or she will pass the same (or harder) test. The Communicator is a Technician-without-code, just as the Technician is essentially a General-without-13-wpm.

If the Communicator wants HF priviledges, all he/she should have to do is pass 5 WPM to become a Technician, or 13 WPM to become a General. Bottom line: If you want HF, learn code. But beyond that, I don't believe we should segregate the new Communicators from the mainstream on VHF.

If we start requiring different combinations of exam elements for this or that mode or this or that VHF sub-band, or establish multi-pronged upgrade paths for different license classes, we will get into a regulatory quagmire that will make the "incentive licensing" problems of the '60's pale by comparison. Plus which, budget realities being what they are, the FCC could not enforce such stratification anyway.

Communicators may very well make great contributions to the brave new digital world of amateur radio. Maybe they can solve the congestion on 145.01, or even cure the common cold! Or maybe they will just be enjoyable folks to talk to. I'm sure a few bad apples will get in, but I don't see how code tests would prevent this. I've heard plenty of rude, liddish and downright illegal behavior on the Extra bands.

Some people have posted that the current exams are intellectual jokes, and that the tests ought to be made harder. That may be, but ham radio is a *hobby*, not a profession. Requiring every ham to have professional-level Engineering and Computer Science skills would quickly kill the hobby, because nobody would bother to apply.

The ham exams were never intended to prove *professional* competence in state-of-the-art radio and computer design. They were designed to ensure that the applicant had gone to the trouble of finding out some reasonable level of knowledge in radio and related matters, so there was a reasonable chance that he would have the basis to become competent in the aspect of hamming he/she chose to become involved in. I believe that passing the current General/Technician level test is ample evidence of having taken such trouble, even if it doesn't qualify one for a job as a circuit designer.

I do *not* want to see the regulatory classification of hams into pseudo-ethnic groups based on mode or operations preference--another reason why I oppose banishing the Communicators from below 220 mHz. Heaven knows, we do enough of that ourselves without help from the FCC. It's like the old Tom Lehrer song: the DXers hate the contesters, the experimenters hate the FM repeater folks, the old lids hate the young kids, and everybody hates the ragchewers!

I personally believe that the diversity of ham radio is its strength. If you want to handle traffic, there's a place for you. If you want to interface radios and computers, ditto. If you want to tweak antennas, ditto. If you want to make friends in foreign countries, ditto. If you just want to grunt "59, please QSL," ditto. If you want to design the next generation of transmission modes and networking protocols that will solve all the world's communication and spectrum space problems forever, ditto. Or if you just want to chat for hours about something that you and a fellow ham find interesting, or even about nothing at all, ditto.

But now, back to code, and the notion of obsolesence in general. I said before that CW should be kept as a requirement for all licenses that have HF priviledges. First off, international regulations require it. But there's more to it than that. CW may be irrelevant to the kind of radio that many computer people are interested in, but it is not obsolete. CW is an international language with its own kind of music, grammar, and even humor. Tune the "utility" bands. You'll still hear a lot of CW there.

Watt for watt, CW will get you farther than any other mode on HF. For those of us who rent apartments and are lucky to have 100 watts to a dipole, CW is a wonderful thing. Without a beam and/or high power, CW may make the difference between being able to make an HF contact or not making it. Add a moderate level of QRM, QRN, or QSB, and a good CW operator will read CW far more accurately than a PK-232 reads CW or Baudot. Under difficult conditions, HF packet is useless, and even moderate CW speed may get the message through faster than AMTOR.

There are many hams in the world who are a lot less affluent than Americans. Some of them can only afford a hand-me-down tube rig, maybe even only a CW transmitter built by hand from the innards of a broken TV set. Personally, I like to work such people. They have managed to add their voices to the ether despite limitations that would make most hams in industrialized nations give up. Should we deem all of them

irrelevant just because they don't use computers, packet, or satellite uplinks?

When I was a kid, I took pride in the fact that I could get on the air on a kid's budget using "obsolete" gear. I kept it going with little more than a VOM and a 100 kHz crystal calibrator, and talked to the world.

I had a schedule with a guy in England, and we discussed current events every week. Twenty years before glasnost, I was working Eastern Europeans (mostly on CW), exchanging greetings, learning bits and snatches of their languages, learning geography, marveling over picture-postcard QSLs of exotic locales. I got a thrill from it then, and I still get a thrill from it now. Is all that somehow shameful, because I'm not advancing the art or using the latest technology?

Should I be run off the bands now because I prefer plain old HF SSB and CW to VHF packet? Or because I am currently setting myself up for HF Baudot and AMTOR using a (shudder) Commodore 64? And should I be doubly tarred and feathered for having these preferences, since I am a computer professional and "ought to know better?"

Some of you ultra-techies need to learn (forgive me) a little respect and compassion for others. There's a lot of different kinds of ham radio out there, and it has just as much right to exist as yours does. Without real people to transmit real human communication via your innovations, all your technical knowledge is useless. And remember, when you're dealing with real people, the *usability* of a device or protocol--and how much change it imposes, and to what end--is as important as its technical elegance.

Some of you non-technical types need to develop an open mind toward new technologies, and in some cases, towards new hams, period. What is difficult and arcane today will be routine tomorrow. The bugs will be worked out, or something better will take its place. That breathless kid will learn operating procedure, even if it isn't quite the same one you learned when *you* were a kid. You have a perfect right to prefer older technology or protocol, but don't put down something solely because you don't understand it.

Everybody who develops a "my radio-religion is holier than thine" attitude would do well to look at a few relevant passages from the international radio treaties, the Communications Act of 1934, and Part 97. You'll discover that advancing the radio art is one reason for amateur radio's existence. There's also public service. There's also international friendship. There's also the national benefit having a pool of trained operators and technicians. None of these reasons are given any greater importance than any other.

Frankly, I worry more about ham radio dying from factionalism and internecine warfare than from commercial frequency grabs or a new group of hams who don't know code. But there's hope. The countries of

Western Europe, who warred for centuries, are actually getting it together into some kind of economic union. If they can stop squabbling, maybe so can we.

And in Eastern Europe, even more fundamental things are happening. Where did all those Czechs and Romanians and Soviets learn that there were other ways, greater prosperity, a better life? Why, from (obsolete) Amplitude Modulated broadcasts on the (obsolete) HF broadcast bands, often listened to on (obsolete) tube-type radios.

. . . and now Gorby is importing PC clones.

4486. Soldering to Aluminum, how to do it.

Newsgroup: rec.ham-radio
Date: 1990-07-24 01:26:33 UTC
From: rfc@briar.Philips.Com
Message-ID: <104327@philabs.Philips.Com>
Source record: 9935
Cross-posted to: rec.ham-radio,sci.electronics,rec.radio.shortwave

It is possible to solder to aluminum, using regular rosin-core
solder. It just takes a special trick.
Reason that you can't usually get solder to stick is that there
is a layer of oxide on the surface. Scraping the aluminum in the air
doesn't work, as new oxide forms within microseconds. What you need
to do is puddle some hot solder on the spot you want to solder to.
While you are doing that, and the aluminum is also hot, scrape the
aluminum under the puddle with the soldering gun or iron. You can
also use an old screwdriver to scrape under the puddle. Object is
to let the hot solder touch un-oxidized alumunum, before the
air can touch it. The more scrapes you can make, the more area there
is to get a good solder joint. Once you've done this, you'll have
a spot tinned with solder, that you can solder a wire to. A good test
is to tug on the wire to see if it pulls off or not. You'll need a
large wattage soldering iron or gun on a large piece of aluminum.
If you can, solder to a corner, or create a finger partially cut
away from the large sheet of aluminum to solder to. Or drill 4
holes around the spot you want to solder to, then do it. Object here
is to avoid losing too much heat due to heat sink action.

One word of warning: DON'T use a fancy plated soldering iron tip! I
did once, and the plating came off, ruining it. Use an all-copper
iron or soldering gun tip.

>> Practice on some scrap pieces before you do this on something important!

4487. CW procedure summary (long)

Newsgroup: rec.ham-radio
Date: 1990-07-24 01:31:16 UTC
From: nicholso@hpcuha.HP.COM
Message-ID: <22480008@hpcuha.HP.COM>
Source record: 9947

Hi,
I got more than a thousand lines of replies to my question about CW procedures, so the following is a more of a commentary than a full summary. Many referred me to the ARRL Operators Manual. However, my original set of questions came after I couldn't find an explanation of some heard-on-the-air procedures in the book. And even after all the replies I still have questions.

What CW procedures one uses depends a lot on things, including the experience of the operators, the signal conditions, and special circumstances like formal message traffic, contests or working a busy DX station. For casual contacts, CW procedures tend to be very informal.

My comments are aimed mostly at casual QSO's for novice operators (or other new operators; there are a few people here who got Advanced or Extra Class licenses before ever getting on the air.)

- ? or QRL? or QRL? DE KK6MP
Always, always, check to see if the frequency is in use before calling CQ. Sending the callsign is legally correct, but is longer and more likely to tromp on a QSO in progress.

Question: what should I do when I need to tune up on the air before transmitting the QRL? (e.g. setting up an antenna tuner or testing a new antenna)?

- CQ CQ CQ DE KK6MP KK6MP KK6MP K
Never end a CQ call with a KN - it's an self contradictory.

- KK6MP KK6MP DE N6YWU N6YWU AR or
KK6MP DE N6YWU K
AR is a more formally correct, but K is widely used.
Novices appreciate a second chance to copy the callsigns.
In busy situations, you can just send your callsign.

- N6YWU DE KK6MP (R or R R R or FB) ...
One R after the callsign seems most formally correct.
Only send an R if you copied everything solidly and don't need a repeat of any information.
SOLID CPY means the same.
R R R is redundant, but useful in poor signal conditions.
R R R before the callsigns is heard often in Novice bands.
R FB is redundant, but also heard frequently.
FB indicates approval of something the other guy said.
OK indicates that you at least copied the general meaning.

But what do you send if you didn't copy everything?
a) if you don't plan on asking for a repeat?
b) if you missed something specific, like a name?
c) if you want some unknown information repeated?

- UR RST IS (579 or 579 579 or 579 57N)
N is a "cut number" abbreviation for 9
Whether to send the signal report twice depends on signal conditions
and the experience of the operators. In novice bands I
usually hear it sent twice, the second time using a cut
number for 9. Experienced operators seem to send the RST
only once.

- periods vs. BT as punctuation
BT is used as an informal pause or break in thought.
BT BT means you need time to think.
Periods are preferred when transcribing from printed text.
Commas and periods are often used when sending your QTH
... UR RST 599 BT QTH IS CUPERTINO, CA. NAME IS ...

- what to send?
In a typical novice QSO, first send the signal report, QTH and
name. Often I hear everything repeated twice, either because of
signal conditions or to give the novice on the other end a
second chance to copy.
Many QSOs begin with TNX FR UR CALL BT ...

- how to turn over the QSO to the other guy.
... BT HW CPY? N6YWU DE KK6MP (K or KN)
... AR N6YWU DE KK6MP (K or KN)
... DE KK6MP K
... KN
... BK

K tells the other guy to go ahead
KN means you don't want anyone else to break into your QSO, but
just K seems to be used more often.
Asking HOW COPY? seems to be a common practice on the novice bands.
AR is a more formal way to separate the body of the QSO from the
callsigns.
If the exchanges are taking close to 10 minutes you need to send
your callsign every time to be on the safe side. Both callsigns
used to be required, but now you only have to send your own.
(unless handling 3rd party traffic.)
When going back and forth quickly you can use BK which means
break, back, or back to you. One respondent said that BK TU is
redundant. Another respondant says that BK by itself isn't that
good of an indicator that you're turning it over. Comments?

- concluding a QSO
... 73 SK N6YWU DE KK6MP is formally correct, but
... 73 N6YWU DE KK6MP SK seems more often used.
... 73 AR N6YWU DE KK6MP SK is also used.

... 73 DE KK6MP SK is short.

After both stations sign clear with SK other stations are free
to call.

... SK {callsigns} CL means you going off the air even if there
are other stations calling.

- ending with dit dit
a quasi-legal way to say you were still around to hear the
other persons final call.
on novice bands you hear
==> dit dit-dit-dit dit
<== dit dit (shave & a haircut, 2 bits)

- abbreviations
Experienced hams use *lots* of abbreviations.
Don't use a lot of abbreviations with new Novices.
My list of abbreviations most often heard :

AGN -again. BK -break, back.
C -yes, correct. CL -closing station.
CUL -see you later. ES -and.
FB -fine business. HI -telegraphers laugh.
HR -here. PSE -please.
RPT -repeat. SRI -sorry.
TNX -thanks. TU -thank you.
WX -weather. 73 -best regards

QRL? - Is this frequency in use?
QRZ? - Is someone calling me? or I didn't get your callsign.
QSO - what you're doing when your contacting someone on the air.
QTH - my location ...
QRT - going off the air.
QSL - has 2 meanings
1) I will send a QSL card.
WILL QSL VIA BURO
2) I received that piece of information correctly.
(field day contest exchange)
==> KK6MP TU 1A WV BK
<== DE KK6MP QSL 1A WV TU 1D SCV BK
==> QSL 1D SCV TNX QRZ DE W#XXX K
QRS - Send more slowly, I can't copy that fast.
QRM, QRN, QSB
- various problems receiving your signal.
QRP - I'm only running a couple watts.

4488. Icom IC901 mod file

Newsgroup: rec.ham-radio
Date: 1990-07-24 01:32:21 UTC
From: rfc@briar.Philips.Com
Message-ID: <104329@philabs.Philips.Com>
Source record: 9936

copied from packet:
From: KA2YKC@KA2YKC.NJ.USA.NA

Here is the mod for adding TX on the entire VHF side and extended
RX/TX on the UHF side. Remove the rear cover on the control unit by
removing the 2 screws on the back and carefully snap the cover off.
Locate the diodes on the side of the circuit board. Locate the space
labeled "D-18" and install a diode. This adds TX on the full portion of
the VHF side. Locate and remove "D-25" and unit will now receive
full coverage on UHF side. Install this or other diode in the space
labeled "D-23" . This adds TX coverage over the entire UHF side.
Replace the cover as this completes the mod.

D-18 -> adds tx to 2meter band (136-174 Mhz)
D-25 -> adds rx to 440mhz band (400-480 Mhz) remove diode
D-23 -> adds tx to 440mhz band (400-480 Mhz)

There are spaces for other diodes but I only had access to the main
and vhf/uhf units so I could not test other possibilities. Any success
would be appreciated for my records. All diodes are 1N914/1N4148 or
equivalent.

Disclaimer: You and I both know the deal: I hold no responsibility as
these mods are for educational and/or test purposes only and it is
illegal to transmit on anything other than the Ham bands with this
rig.

Hi,

More questions...

I've got an Icom 24AT. It comes with a NiCad battery pack. How do I tell when I need to charge the batteries? How long do I need to charge the batteries for? (The manual says 15 hours regardless of battery pack size.) How do I know how much battery life I have left when in the field? Does the unit just die when the batteries run out or what? How long can I store a charged up spare battery pack?

Thanks,

4490. G5RV antenna

Newsgroup: rec.ham-radio
Date: 1990-07-24 01:56:02 UTC
From: rfc@briar.Philips.Com
Message-ID: <104332@philabs.Philips.Com>
Source record: 9938

copied from packet:
Msg# TSF Size #Rd Date Time From MsgID To
30840 BF 4924 4 13-Jul 2049 KC6CFF 5766_WB6LYE ALL@ALLUSA ()
Sb: Homebrew G5RV All Bander

The G5RV is an easy-to-build 80-10 dipole requiring no traps. All bands are covered, including 30, 17, and 12. The G5RV has high SWR, by design, on most bands and a tuner is required. Unlike most dipoles, the "basic" design is not a 1/2 wave, but instead a 3/2 wave dipole on 20 meters. A half size unit can be built, halving top and feeder, for 40 and up. For more info and detailed theory about this versatile antenna see G5RV article in the ARRL Antenna Compendium. The article is by G5RV himself, the only HAM we know honored by being named after an antenna, according to Jim of RADIO WORKS.

< 102 ft. >

---

34 ft matching section *

* Adjusted for velocity factor of feeder, if necessary.

* HINTS, ETC. *

This is my first antenna project. I built mine with insulated 12 ga. wire I had laying around. Initially I had "homemade" open wire feeder for the matching section. The antenna worked fine on 20 and up, but turned my tuner into a "self lighting" meter unit on 40 and 80 (smelled kinda funny too). Originally I blamed my budget tuner, but after replacing the open wire (because of storm damage), it now works fine on 80, 40, 20, 15, and 10. I don't have WARC capabilities and can't report performance on those bands.

The replacement matching section is 300 ohm twin lead with the length adjusted for it's velocity factor (34 ft * .82). The top is kinda touchy when it comes to trimming. My antenna is hard to get at so i shortened up 1 ft first try and moved the resonant section from well below the band (SWR was 1.6 at lower band edge on 20m) to above 14.2 (SWR 1.3). Light trimming is suggested. Due to the normal high SWR, others have suggested not using a coax feeder with wimpy dielectric, particularly if running substantial power.

So how's it work? I LIKE it. One antenna that works well on all bands. I've received good reports, voice and cw, on all bands running a barefoot Yaesu FT 101B. Surprising number of contacts from QTHs that would seem to be unfavorable because of my antenna orientation. My next G5RV is going to be a half size unit wit a different orientation and

extending the 300 ohm line all the way back to the tuner. (G5RV recommends the open type feeder, by the way). If you build (or have built) a G5RV and have anything to add about this versatile antenna, please send me feedback at the address below. I'll put out and updated version of this file.

Happy HAMing ... Jim KC6CFF @ WB6LYE.#KLMTH.OR.USA.NA

Note: I haven't tried this, proceed at your own risk. WA2ISE

4491. Problem DX QSLs

23 CE3/OH6VR, CE3/OH6NTO - OH6VR
24 AH3C/KH5J - OH2BN
25 A51JS - VK9NS
26 A41JR
27 A15AA - DJ6SI

Notes:

4. (SM7PKK) I expect Mat is still on or recovering from his trip.

6. (ZY0SS) I have sent IRCs and green stamps. One guy here reported receiving his card, and cards for other folks in the same envelope, and forwared them on. Maybe the guy who received my cards wasn't so nice.

8. (ZS8MI) Some folks have received cards, some haven't.

12. (XF4T) Derek, AA5BT, is still waiting. Anyone else?

14. (S01EA) Some folks have received cards from EA2JG for previous expeditions, some haven't. Wonder which bunch I'm in...

18. (LU1ZA) Other folks have received cards, and even I received a card for a QSO a few years ago. Just not this time.

19. (JT1KAI) I have never received a direct QSO from Mongolia. I heard neither IRCs or $$ work over there. Fortunately, I have my JT0DX cards now.

22. (CE0OGZ) My father has never received cards, yet Jim, K6ZH, has.

23. (CE3/OH6) They were supposed to be in Chile for a year or so.

25. (A51JS) Guess the cards are trickling in slowly.

27. (A15AA) Baldur is funny about cards. He sorts them approx. by how much money you send in. Since I only sent IRC's, I think I'm last in line (not counting the cards he receives via the buro, which he throws away).

4492. ANS: Communicator Class

Newsgroup: rec.ham-radio
Date: 1990-07-24 02:36:44 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9007240236.AA13188@tecnet1.jcte.jcs.mil>
Source record: 9944

>> (Talking about Communicators on two meters)

swrinde!emory!wa4mei!ke4zv!gary@ucsd.edu (Gary Coffman) replies:

>Not exactly, in most parts of the country there is currently
>very little activity above two meters. By dumping the newcomers into the
>wasteland they will either fail or more likely form their own CB-like
>clubs to support their new repeaters.

I agree that in many parts of the country there are very few repeaters above two meters, and I don't have a snappy answer for that problem. You make a good point in that regard.. but let me says this. *IF* the new hams did have the guts and glory to put up a new machine I very much doubt that it would turn into a "CB like club". If they put it up, the local (old timer) hams would flock to it like bees to honey, and the Communicators that put it up would gain instant recognition and a fair degree of respect.

>By ghettoizing them this way they
>will not receive the socialization needed to become mainstream hams.

May I politely object to your use of the term "ghettoizing"? The very word brings up very terrible images and I do not believe that it is fair to liken 220 or 440 Mhz to a ghetto. A virgin forest that is untouched by human hands that is full of promise and beauty is my view of it... not a GHETTO.

On the matter of socialization... I think you make a good point, but my only question is.... why hasn't anyone thought of doing the same thing for the Novices? Don't they need the same type of guidance, and in fact more so.. since they have always REALLY been the entry level hams? This point is so obvious, I can't help but imagine that someone else has thought of it before... yet it was never mentioned before this Communicator thing came up, and that makes me rather... well.... it makes me wonder.

>When I mentioned pioneers moving up frequency in my previous posting,
>I carefully noted that this is only happening where two meters is
>filling up. In most parts of the country this is not the case yet.

I understand, but in all honesty there are other reasons for "moving up" than simple overcrowding and disgust with current conditions. Some hams do it simply because "it's there". There are a LOT of people that think that way in my opinion.

>> Discussion of what we all really want for the Communicator Class deleted.

>I personally want several things from this restructuring but, primarily
>I want fairness. I admit that I am still bitter about 1968. I can never
>understand why I was required to demonstrate faster CW operation in order
>to regain some of the voice frequencies I enjoyed prior to 1968. In my
>opinion incentive licensing has been the biggest disaster for amateur
>radio. It created a divisive caste system that haunts us to this day.
>I want to bring hams back together instead of creating a new class of
>untouchables.

And a lot of people agree with you. I just don't happen to think that this
new Communicator Class is the proper vehicle for your goals. If that is
your desire, why not attack the problem at it's roots instead of at it's
branches? I do see where you are coming from though, and can understand
your feelings on the matter.

>I also want to see a lot of young hams come back into the hobby. As
>Phil Karn said, ham radio has been the start of a lifelong interest
>in electronics and high technology in general for many people. I count
>myself as one of those. I want a new generation of twelve year olds to
>experience the magic like I did.

Will the Communicator or Novice Class be more likely to do this? I know
that the Com. Class will have no code.. but it will also have a pretty hard
test (or
at least it is supposed to). I still see the Novice as the basic
entry level class... that is unless they do away with it.

>As for technical folks, I expect that they will be represented among
>the newcomers in about the same proportion as they are in the current
>ham population.

A truer statement was never made... at least in my opinion! Thanks for
the nice answer Gary.

[Gee, isn't this N8DGN's exclusive territory ?] :-)

Summary:
Spread Spectrum
Either frequency hopping (minimum 75 frequencies, >= 25 Khz seperation,
bandwidth < 25 Khz, time of occupancy on any freq. < .4 seconds
in any 30 second interval)
Or Direct sequence with minimum 6 dB bandwidth of 500 Khz.

1 watt (with a warning that this may be lowered if the current power
level causes problems)

>Phil

On Long Island (where I lived before college), this approach is taken:
if a repeater has PL, it's probably using the "Long Island" tone. This
is necessary beacuse of the radio proximity to Connecticuit. I offer
that it is a good idea to do this, because the repeaters are still seen
as "open" and everybody knows about it. (The only guys who are mad are
the ones with IC-2AT's and other non-PL radios).

Tropo is pretty hairy down there during the summer, too :-) I once
had a conversation on 146.52 FM between Long Island and North Carolina,
using 30 watts. Last summer, most nights after sunset I could bring
up at least 2 (and often 3) repeaters on 147.180 -- Naugatuck, Conn.,
one in central New Jersey, and occasionally one with a 1-call that I was
told is somewhere near the MASS-NH-VT lines. I wonder if the L.I. sound
has much to do with this?

>Everybody who develops a "my radio-religion is holier than thine"
>attitude would do well to look at a few relevant passages from the
>international radio treaties, the Communications Act of 1934, and Part
>97.

This attitude works both ways ... I passed my extra a few months ago,
I am 21 years old, and I worked [CENSORED] hard for it !!! And I am
getting fed up with people trying to make me feel GUILTY about earning
my extra (for WHATEVER reason).

Code doesn't really matter all that much on VHF/UHF unless it's something
you WANT. (Satelite, EME, etc.) It *IS* important on HF. Furthermore,
I value the protection of the extra 25KC on CW, where it's a little
quieter. I see the extra HF voice space as something I have earned and
will enjoy, and I invite everyone to come join me.

BUT the solution to **ALL** of this clamoring is **NOT** to lower
the standards of the licensing structure -- this is the kind of live-
for-today mentality that has brought many of this country's problems
upon itself...and if you're one of these people with the mouths,
maybe you should think about what you want out of ham radio within
the constraints of the current system, and leave the changes to the
less emotionally driven.

Does anyone out in net-land know anything about the Venturer Multiband Receiver from Haverhills? I saw their ad in the Atlantic magazine recently, and it looked attractive. Here are the details of the receiver:

Venturer Multiband Receiver - $99.95 (Three for $199.90!)
AM/FM, shortwave & ham radio bands (4 to 12 mHz), TV-radio channels 2 to 13, U.S. Weather Bureau reports, police, fire, ships and civil defense news, aircraft band, and all 40 channels of CB band. 110-volt supply or 12-volt D.C. source/battery.

I'm looking for a shortwave radio, and would like to hear your comments about this Venturer set.

Shouldn't we strive for a little more than "competence" ?

4506. Communicators and 2m, status of the hobby

Newsgroup: rec.ham-radio
Date: 1990-07-24 15:28:59 UTC
From: d.reeves@oxy.edu
Message-ID: <104166@tiger.oxy.edu>
Source record: 9964

About the Communicator Class liscense comments which have been flying about the net:

1. Living in the LA valley will put a diferent perspective on what you think 2m crowding is. There are lots of repeaters out here, And several of them serve good purposes (CHP traffic, Seismology nets, "dedicated" rag-chew machines). But the amazing thing is that so many of them are always dead, or have VERY unfriendly opperators on them. However, very few of them use PLs (aka CTCSS). And further, there haven't been any coordinated frequencies avaiable here for sale in a while. Thus, we have lots of unused repeaters and wasted bandwidth.

2. 440 is an option. Yes, outside of major metro areas, there are few 440 machines, and they are expensive to get going (we just got the W6UE, Caltech ARC machine up and running, yea!). When 2m runs out of space (as it has here in LA), people WILL move up in frequency (is this the same as moving up in the world? :-). However, in some major Metro areas, even 440 is full - we were lucky to get a coordinated freq.!

3. Incentive licensing for the sake of incentive licensing must go.

4. The Ham population must become younger if the service is to survive, or it must change its attitude about persons under 35 getting involved in our hobby. I got my ticket when I was 19, and the attitudes of many hams has been most frusturating, as I am both a college student AND under 25 - there seems to be an attitude that I couldn't possibly be a good ham, or technically compitent when dealing with RF, DC, mechanicals, etc.

So what do we need to do? Allow communicators 2m? Probabally.
Change the way frequencies are coordinated? Absolutely.
Not make an Extra-class ticket a prize? Probabally.
Expand radio in colleges/universities (even high schools)? Yep.

I've thought long and hard about what I've said, and I say it because I am concerned for the future of the hobby. Feel free to respond and/or flame me, as my opinion is by far the only one.

Me too! Great radio! The display flashes when you're about exhausted.
I bought extra batteries to use when this happens. My experience (20yrs)
with NiCds is that they should be used until exhausted (_not_ flat) and then
slow charged at about 10% of Ah rating for 10 to 15 hrs (depending on who
you listen to - NiCd maintenance has a religious aura around it) for
maximum life. Fast charging is OK but IHMO the cells die sooner when fast
charged a lot. ICOM suggests replacing batteries after 300 recharges. Other
vendors say that NiCds can be recharged 1000 times. Leaving a battery on a
charger longer than it take to recharge creates nothing but extra heat and
a shorter life for the battery.

4508. Do we need *more* hams, or less?

Newsgroup: rec.ham-radio
Date: 1990-07-24 16:22:52 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <24.Jul.90.18
Source record: 9971

I have watched the 'discussion' re. incentive licensing with a mixture of amusement, horror, and deja-vu.
My question: *WHY* do we want *MORE* hams? Surely, its a fact that as the numbers go up, the quality comes down.
(If you really want *more* hams, why not just sell licenses by mail-order and then you could have charging based on number of band segments or privileges).
No seriously, I think we should be encouraging RAISING of standards, not lowering them. Make the test harder and introduce a code-free license.
(I am against the UK 'Novice licence'; IMHO it can do nothing but harm...)

Source record: 9949

Well, I am glad to see this discussion has not disintegrated into
the usual code/no-code arguments. There had been some progress,
at least all the arguments now assume some form of no code license.

In the latest (August) CQ magazine Fred Maya (W5YI) talks about other
countries experiences with various classes of licenses. He makes
several good points about most issues that heve been discussed
here. I recommend the article to all the combatants. Two interesting
points he makes are: 1) the US has more classes of licenses
than any other country, and 2) we US hams should do something to
help relieve the work load of the FCC in supporting our needs
(licensing and administration).

Fred makes a valid argument that the US ham population could be
served by 4 classes of licenses.
1) All HF bands, all VHF/UHF bands, all test elements, 15 wpm code,
2) Some HF bands, all VHF/UHF bands, all test elements, 5 wpm code,
3) All VHF/UHF bands, all test elements, no code,
4) Some VHF/UHF bands, some test elements, no code.
While some arguments can be made over the testing requirements, on
the whole this seems a pretty good plan.

Now for my opinions. One of the problems with the current scheme is
the call sign recognition of achievement avaliable ("badges" so to speak).
So, if necessary to keep the current Extra (and maybe advanced) classes
happy allow another testing element (code or theory, your choice) and
the only "privilege" you get is a call sign assignment from a select
group. Say normally assign 2x3 calls to the all classes and allow the
"chosen" to get a call (FCC assigned, not you pick 'em) from the 1x2,
2x1, 2x2, 1x3 call sign groups.

In fact, maybe the FCC could be talked into allowing you pick 'em call
assignments if the amateur community could reduce the paper work load
by recucing the number of classes of licenses. Now that would be an
interesting conflict for the OFs. We get to pick our calls but open
the licensing and priveleges. Hmmmm, how about:
1) All bands, pick ur own call, all test elements, 15 wpm code and
either a 20 wpm code test or another theory test.
2) All bands, assigned call, all test elements, 15 wpm code.
3) No HF, all VHF/UHF, assigned call, all test elements, no code.
4) Minimal HF, minimal VHF/UHF, assigned call, some test elements, no code.
an individual could hold 3 and 4 at the same time and maybe even have two
calls as a result (the idea is to reduce the FCC work load here).

Give the new classes new names too, dont try to sort the old names. Just
use class A, B ,C,and D. Makes it easy to figure out precedence.

Well that should cover it for now.

Regards, Dave KE6ZE (an extra class licensee)

Well, I don't know why you got that info, but I was at the awards ceremony last night on Blake Island, and watched the gold, silver and bronze medals get handed out.

Gold: K1AR and K1DG
Silver:K7JA and W9RE
Bronze:KQ2M and KR0Y

I guess I'm not surprised that preliminary info about the 3rd place team may have been incorrect, because as of last night, the judges were still going through the logs to determine everyone else's standings.

Many there were a bit surprised at the clean sweep of the medals by the US teams, although it was apparent right after the contest that AR and DG where way out in front. One interesting note: the top two teams, AR/DG and JA/RE were only 8 blocks apart during the contest. Probably the closest spaced of all the contestants. K1AR mentioned that they never had any problem knowing how Mike and Chip were doing. In fact John said that at one point he told DG that they were behind, and Doug just picked up the pace a bit, and pulled ahead.

When I hear the final scores for all the contestants, I'll post them.

P.S.: Re the scoring for the WG stations: It's based on a 'curve' i.e. the team with the greatest CW QSO total gets 100 points, the team with the greatest Phone QSOs gets 100 points, and those with the greatest number of multipliers or 'counters' gets 100 points. The others scores in each of these categories is ratioed to that 100 points. The winners, above, had the greatest total score, i.e. CW plus phone plus counters, with the greatest possible score being 300.

There was a special award for the highest CW score, won by the German team, DL5XX and DJ6QT.

Jordan Kossack's proposal is rather close to mine. However, he merges Advanced into General with current privs. I merge Advanced into Extra, so not too many people lose privs. If Advanced is merged downwards, then certainly the merged General should get something beyond current General privs -- LOTS of the fone bands are reserved for Advanced and Extra.

(Or call it Class A and merge the two of them, making the name Neutral.)

Well that sure hasn't happened with the Novice repeaters put up by the
old line clubs. Listen for a while and all you hear are new Novices
stumbling along while telling each other how desperately they want to
upgrade as quickly as possible. The old timers (who funded the thing)
flock to it like bees to vinegar. And five minutes after the Novice
upgrades his 220 HT is forsale. In the old days when Novices had
two meter voice privledges (and a one year nonrenewable timelimit),
the Novice was able to go where the real hams were and join right in.
He got plenty of help and encouragement.

>On the matter of socialization... I think you make a good point, but my

>before... yet it was never mentioned before this Communicator thing came up,
>and that makes me rather... well.... it makes me wonder.

Well prior to 1968 Novices DID have voice privledges on TWO METERS.
The real point here though is that the Novice Class has always been
considered a brief stepping stone on the way to becoming a REAL ham.
The Communicator Class is viewed as a permanent alternative to the
traditional license classes. Thus while the Novice will become
socialized after he becomes a REAL ham, the Communicator never will
unless he can freely intermix with the traditional ham.

No real argument here. I think the Novice license should be continued as
a way for those who want to follow the traditional path into the hobby.
However there are many people who would willingly study theory very hard
in order to get a license because they understand that knowledge of
theory is important to what they want to do with radio. Some of those people
do strongly resist learning Morse Code, not because it is necessarily
hard, but because they don't perceive it to be relevant to what they
hope to do with radio. A revolution began in the 60s that has quietly
taken firm root in the American psyche. That revolution said, in part,
"Why should I be forced to take Latin to get a EE degree?" Ham radio
still requires Latin for it's members and that has seriously hurt our
recruitment.

4518. Some New Ideas on Licensing

Newsgroup: rec.ham-radio
Date: 1990-07-24 18:44:07 UTC
From: magid@select.enet.dec.com
Message-ID: <13824@shlump.nac.dec.com>
Source record: 9969

The following licensing idea came to mind after reading all of the notes in this file about the "Communicator Class" and "Incentive Licensing"

We could actually use our current system (already in place) and accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people into this hobby.

2. Have those already in the hobby expand their knowledge of the various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated. (not sure anything the government does is not complex)

Class Elements Options

Novice 2 CW 5 WPM

Technician 2,3a Pick (1) from list below

General 2,3a,3b " " " " "

Advanced 2,3a,3b,4a " " " " "

Extra 2,3a,3b,4a,4b " " " " "

Communicator 2,3a * (required)

Option List: (Aside from the code Exams these tests will be 25-30 multiple choice questions designed in the same manner as we have our tests designed today however the pool of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV
j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM Code will be required for upgrade to Technician. (this assumes that the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more to be a certain class then it does now.

>field? Does the unit just die when the batteries run out or what?
>How long can I store a charged up spare battery pack?
>

You should run your battery down before recharging. When the radio
quits, it's time to charge the battery. Keep a spare pack with you
in the field and rotate your packs every time. Nothing is more
destructive to a NiCad battery than continually doing partial
recharge cycles. Recharge rates are a function of the charger and
the battery. All NiCads can be safely charged at the .1C rate. That
is, if the battery has a capacity of 500ma/hr then you can safely
charge it at 50ma/hr for ten hours. Actually, since battery charging
is never 100% efficient, you need to charge it for more than ten
hours to get it back to full charge. Rapid charge packs have a
thermistor embedded in the pack and a sense circuit in the charger
that allows you to charge at the 1C rate safely. That is, a 500ma/hr
pack can be charged at 500ma/hr for one hour to bring it back to
full charge. The thermistor senses the rapid temperature rise that
a fully charged pack exhibits when continued charging is attempted.
This protects you from destroying the pack by accidentally attempting
to rapid charge a partially discharged pack. Depending on storage
conditions, a charged pack will lose up to one tenth of it's charge
every day so rotate your packs regularly.

>
> 1. Does anyone have the text of that regulation ?

From the ITU Convention, as printed in Appendix 2 of 47 CFR 97 (the FCC amateur radio rules), Article 32, Section I, paragraph 3(1):

"Any person seeking a license to operate the apparatus of an amateur station shall prove that he is able to send correctly by hand and to receive correctly by ear texts in Morse code signals. The administrations concerned may, however, waive this requirement in the case of stations making use exclusively of frequencies above 30 MHz."

> 2. Does it state in the regulation what the minimum speed
> required is ?

No.

> 3. If the regulation is so well enforced how does the CB world
> exist in the US under that ITU requirement ?

Because CB is not an amateur service, it's a land mobile service. Police officers, ambulance drivers, firemen and cell phone users aren't required to know the code either.

Re: the BARF boys' assault on K1MAN

BARF's radio-terrorism is certainly entertaining, at least as much as
K1MAN's propoganda. Why Glen Baxter was motivated to editorialize
against the Dawg and F-Zed is beyond me. After all, he had his own
little corner of the spectrum, and most of us are content to let him
play with himself.

Having seen BARF's demonstrated ability to totally disrupt a frequency,
I think Glen committed a grevious tactical error; "broadcasters" need
clear frequencies to do their thing.

Re: Hams vs CBers

The neat thing about SSB is that all the voices are heard. No
heterodynes as on AM CB. In many respects, it's the largest
public-speaking forum available. It's fun to hear the snide remarks
made during another operator's "editorial". Total Chaos ? Maybe.
I like to think of it as the ultimate in "free speech".

Re: WA4D, KV4FZ

I thought I heard the Dawg rip into F-Zed during the July 4th weekend.
Are they working in concert now ?

I am marginally impressed by these guys - they certainly have brains and
F Zed approaches eloquence on occasion. If they weren't so irritating,
maybe their message would mean more.

>That out of the way, tune in and gawk a bit. It's fun. And if you are
>a ham and DARE to transmit, be sure and sign you call. It will make you
>stand out in the crowd....
>=============== WB8EOH = The Eccentric Old Hippie = WB8EOH ================

I haven't gotten up the nerve to key the mike. I've actually heard
KV4FZ demand callsigns with comments. Gee, I didn't know he was so
thoughtful of the rules :-)

Re: Free Speech

I think the US Amateurs take their US Consititutional rights with them
to the shack, not realizing that SWLs and Hams in other countries may
not understand our society. We in the US have raised free speech to an
Art Form, allowing all sorts of marginal communication techniques to
be used.

I've often wondered if the FCC's agreement with WARC is unconstitutional
wrt 1st amendment. If you can't discuss politics, religion, and other

controversial topics, why bother ? :-)

|> Or Direct sequence with minimum 6 dB bandwidth of 500 Khz.
|>
|> 1 watt (with a warning that this may be lowered if the current power
|> level causes problems)

I don't remember if I've mentioned this earlier, but one of the things I saw when I visited the FCC last month was a current press release describing some modifications of these rules. Part 15 spread systems are now required to exhibit at least 10 dB of processing gain (for a direct sequence system) or to have receiver bandwidths comparable to the instantaneous signal bandwidth (for frequency hopping systems).

It seems that some of the vendors were cutting corners by spreading at the transmitter only because they were required to do so -- the receiver made no attempt to obtain any processing gain. For example, in direct sequence, the receiver would simply demodulate each spreading "chip" and then remove the spreading sequence to yield the data; in frequency hopping, the receiver bandwidth was made equal to the total spread bandwidth so it didn't have to follow the signal. Of course, this approach meant that the transmitter had to run much more power than would be necessary if the receiver did an honest job, and there'd be much more RF and QRM on the band than necessary. So I was delighted to see the FCC get wise.

It'll be interesting to see how many companies survive this rule change. Those that have been working on "honest" spread spectrum systems will have no problem, while those who would have foisted inferior shortcuts on a trusting and unsuspecting public got what was coming to them. :-)

My impression of the Red Cross messaging system is that it implements with people something that should be done via computer. The connection cost of the entire system is tremendous - surely we could approach it like a computer network.

What little experience I had with the California quake was that 20m SSB was extremely inefficient, considering that most of the messages could have been typed into a computer and shipped to a BBS in the Bay Area. The only problem is that there are damn few routes for VHF packet to the West Coast. [it turned out that I passed the most messages by going to my desk and calling another HP ham on the Corporate telephone, having him call the recipients from his office. So much for aura and mystique of Ham public service :-)]

It seems to me that we need to develop an effective HF packet protocol, with cross-band connections on both ends to VHF. Maybe store-and-forward via satelite would work, but portable Earth stations are hard to come by in some areas of the world. Maybe someone can enlighten me on OscarPacket and the feasibility of putting a BBS in space.

IMHO, adding another priority to the networking system is just tinkering. The real problem is in the underlying technology.

Peter Klein's remarks were very well said. I hope you turn them into formal comments to the Commission -- that would certainly raise the average literacy and thoughtfulness level of the file!

I do have one nit to pick, however.

|> Some of you ultra-techies need to learn (forgive me) a little respect
|> and compassion for others. There's a lot of different kinds of ham
|> radio out there, and it has just as much right to exist as yours does.

I have NEVER felt or said otherwise, nor have any of my ultra-techie colleagues. (Well, I *will* admit to a few tongue-in-cheek comments about how CW ought to be banned because of its abysmal spectral efficiency, but I hope that these were taken in the satirical spirit in which they were intended. Just don't try to argue to me the merits of a mandatory CW requirement on the basis of CW's supposed spectral efficiency!)

My support for no-code has long been based on a desire to pursue technical development by attracting more hams with similar interests. I absolutely have no quarrel with those who wish to pursue more traditional activities - as long as they don't stand in the way of others who have different but equally legitimate interests.

For what it's worth:

If you can't afford a UPS, slightly cheaper method involves powering the
PC off a smaller battery which is connected via diode to the vehicle
This way current only flows from the vehicle battery to the small one.
I haven't tried this, but a lot of RVs use this method for their 12v
lighting.

In article <2746@anasaz.UUCP>, john@anasaz.UUCP (John Moore) writes:
> I don't think spread spectrum will work at all for "repeater
> coordination" problems. [discussion of near-far problem in repeaters]

I didn't say "repeater coordination", I said "spectrum management". Repeaters are a large part of the problem; I'm trying to find ways to introduce new services and facilities in the face of existing repeater operators and councils who already feel they own the band and refuse to make any room.

As for the near-far problem in repeaters, that's an issue only if your repeater is true full duplex. But you can effectively simulate full duplex with a half duplex system if it is fast enough. (An example is the experimental Ethernet telephone on my desk. Ethernet is a half duplex network, but I can talk on my phone just like it were the Real Thing.)

The single frequency digipeater/packet switch is the model I have in mind. Although everyone knows how poorly that model has operated in current amateur practice, few understand that these shortcomings stem almost exclusively from our using it with narrowband modulation techniques.

It is not an accident that so many non-amateur packet radio systems use spread spectrum. It's not just the usual special military interest in anti-jam and low probability of intercept. Spread spectrum has many desirable properties in a random, contention-based multiple access environment, including excellent "capture" and multipath suppression abilities. Hidden terminals still exist, but they are MUCH less of a problem.

Spread spectrum will probably never be able to match conventional frequency- or time-division multiple access techniques on the basis of signal orthogonality (the limits to receiver selectivity). For example, with modern crystal filters it is relatively easy to get adjacent-channel rejection ratios in frequency-division systems on the order of 60 dB or more, but attaining similar processing gains (the analogous figures in spread spectrum systems) would require bandwidth expansion ratios of a million or more. These seem impractical for all but the slowest data streams.

This reduction in spectrum efficiency is the price you pay in exchange for eliminating the need for everyone to agree in advance on frequency channel allocations. But if hams are unable to get their cooperative spectrum management act together, then spread spectrum presents a viable alternative to either bedlam (no coordination at all) or

stagnation (keeping it all allocated to existing repeaters).

Source record: 9877
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Thought I'd drop off a note to the experts on the net before breaking my
piggy bank to buy a radio. I'm new to this whole thing so...

I just passed by Novice,Tech written and 5 WPM code test. I'll be working
on General, Advanced and 13WPM code test for a test next month (Why stop
at tech ... ?)

In any case, I want to get a 2m/440 or 2m/220 radio. The first problem is
220 vs 440 ? It seems that you can't have everything. Any advice on that ?

With my "zip" experience in owning any 2m equipment I've done a little research
and have come up with, what I think is a good radio...

Its a Kenwood TM-731A 2m/440 dual band, 30 memory channels, extended freq
coverage, programmable scanning, 50 Watts on 2m, 35 Watts on 440, CTCSS,
etc etc. The price on this is (whew) $649.

==> Does anyone have experience with this radio... Or can someone suggest a
==> better rig than this ???

I'm very much intersted in using this for packet. I will shortly be going
through similar buying trauma for a TNC.

==> Any TNC recommendations ? And software that can be used with a Mac ?

I'd like to get good eqipment, with basically everything from the start ..
.. rather than picking up odds and ends along the way. The latter being,
I think, more expensive than the former.

Any and all suggestions welcome.

Thanks much
Gary Buchholz

> equipped Emergency services and Armed services in the world. The U.S.
> Armed services even have their own phone network. Do you seriously
> think that amateurs are the lynch-pin of disaster communications?

I dunno. Maybe you should ask the Red Cross, or perhaps the local Office of Emergency Services. Maybe they can tell you why they seem to need us so badly and use our capabilities so heavily during actual emergencies. The last earthquake here in the Bay area saw ham radio get a heavy workout. There were lots of tired hams around here providing communications on demand. One might note that the Office of Emergency Services includes ham radio in its response plans. They seem to think that we have some value.

Maybe there's something going on with "health and welfare" services. My family (on the east coast) was very worried about me after the earthquake, and I couldn't get through by telephone (service was out in many areas, and many long-distance lines were saturated). I finally got a message delivered by HF through a ham I talked to via 2-meters. He was operating from DC -- his power was out, too. That convinced me to make getting a DC HF rig a priority. I've got one now, and I'm ready for the next disaster (I hope!).

> In my cynicism I suspect the ARRL is behind this stuff. [...]

You might also ask the military. For some reason our "best equipped" armed services ask for our help on a regular basis. Scores of hams turn out every year to assist the Navy at the Moffet Field Air Show. The Navy doesn't seem to have the personnel and equipment to handle it. Is it possible that they are in on the ham radio propaganda bandwagon too?

> If my local emergency service needs more coms these days, they
> don't call out the fat guys with the walkie-talkies on their belts and
> obsolete police radios in their cars. They call up a cellular carrier
> and get some cellular phones that give them instant coms and ability
> to communicate anywhere in the world.

I suppose they'd exclusively use cellular here too, except that they know that they can't depend on cellular during an emergency. So, they call out lots of us, some fat, some thin (we get plenty of exercise running around during emergency exercises), but most with high-tech radio systems that put police radios to shame. I haven't seen too

much in the way of police TV. The ES office really seems to like
getting direct video of problem areas. Funny about that....

> Yours still learning from amateur radio.

Please consider seeking out the RACES folks in Southern California.
That's an area of high earthquake and fire risk, too. You might learn
that there's more value in amateur emergency service than you think.

Sb: The Aussie Salute - 28 Chapter

From the Ten-Ten International News Service - July 21, 1990
Bob Arnold N2JEU @ WA2TVE.WNY.NY.USA
Canastota, New York U.S.A. (315) 697-7478 (voice only)

The Twenty Eight Chapter of Ten-Ten International announces "The Aussie Salute" running from October 10th to October 28th, 1990. Its an EXTENDED QSO PARTY with a special certificate offered to participants.

Ten-Ten International was formed in 1962 and 1990 will be the 28th anniversary. Complete details will appear in the Summer 1990 issue of the Ten-Ten International news due out during July 1990.

> I don't know about the rest of you but I would prefer not messing up
> my back yard! I know all the flames that this comment will generate

OK, let's get down to the nitty gritty here....

I **DO** want them in MY backyard !!

And because of the fact that I live in a rural-like area, my backyard is stuck at being 2 meters. I do understand that there are many many more hams operating on 2 meters and on UHF bands as well in the big cities, but FCC regulations cover the WHOLE country, not just the cities. And I think a rule that allowed Communicators on 2 meters ONLY in the rural areas just would not work.

> but just consider that for all practical purposes, there is NO difference
> between 146, 222 and 440. They are ALL relativly local in coverage
> (on average), they ALL have relativly simple equipment requirements
> and they ALL have resident hams within easy distance over most of the
> country. Where they are different is that more people are needed

About HALF of the country.

> to populate the upper bands, 2 meters is, for all good purposes, FULL
> where most of these new "hams" are going to appear (in the cities).
> So, does it make sense to make a difficult situation worse? Not in
> my book!

New hams will generally appear IN PROPORTION to the old ones. That is to say that if we see a 40% growth in hams, we will see a 40% growth in the urban areas AND a 40% growth in the rural areas.

BUT if Communicators do NOT get on 2 meters, then you will be getting what you say, because the Communicators in the rural areas will be getting NO (usable) privileges. So what you are arguing FOR will actually be the CAUSE of what you basing your argument on; so I suggest doing the OPPOSITE so that we do not see such a thing happen.

> So why are we forcing one group out to make room for another? That

Because these groups need to communicate with each other.

I would accept limiting Communicators to higher bands *IF* no more 2 meter only radios were being sold (except for recycled ones). If *ALL* NEW radios for the VHF/UHF bands had at least one COMMUNICATOR-CAPABLE band in them, such as the dual banders we now see being sold, then there would not be any issue left for putting Communicators on 2 meters. The only reason to put the Communicators on 2 meters is because so many hams presently HAVE ONLY 2 METERS (as there VHF/UHF capability). Correct THAT situation and then

there will be no problem.

> one smacks of slum-lord tactics, later on the slum lord gets the
> good press for "trouncing urban blight" by tearing down the slums
> and erecting "AFFORDABLE" housing (with HUD money). Did any one
> ask the slum lord who would be able to "afford" the housing?

Make a point, please. Affordability is NOT an issue, really. If a new Communicator is on 2 meters, "Elmer" can talk to him, or buy a UHF radio and move up somewhere else. If the new Communicator is only on some UHF band, then the "Elmer" can also buy a new UHF radio to talk to him, or leave him alone.

How about we start calling the older and more experienced hams as "Elmer"
instead of "Old Fart". Maybe that will encourage them to do what they
should have been doing all along. What decent "Elmer" would fuss and moan
about a bunch of newcomer Communicators in HIS backyard?

Some time ago, the Venturer receiver, and others in its price class
(less than $150-200) was discussed at length.

Without even looking at this receiver or the ad, I can tell you
that this radio will have at least two *frustrating* features:

1. An >inaccurate< tuning system, consisting of a large frequency
range (say 3-8 or 10-20 megahertz) all on one band. Now, 20 megahertz
on one band may be just fine for FM (88-108mHz) where the signals
are very wide (about 50-100 kHz). But, it is only an invitation to
discouragement with signals that are about 5 kHz wide. Tune in a
station once; you may not tune it in again because you can't remember
where it was on the @#$#@$ dial!

2. Single conversion circuitry, which allows a whole host of
false signals ("birdies" or "images") to interfere with the
station you want to hear.

I have never seen or heard of a *good* shortwave radio for less
than about $175-200....if anyone on the net knows of any, please
let me know....but most, if not all, of the shortwave receivers
advertised in popular magazines, mass-market catalogs, creditcard
invoices and the like are too cheap to be any real good.

>Shouldn't we strive for a little more than "competence" ?

No, why? Were you an expert when you first got interested? I sure
wasn't.

Ham radio operators do not spring full-grown from Zeus's brow; they
grow in skill and capability as they gain experience.

Or do you want them to become expert professional hams somewhere else
before we let them on our bands? Get real. Everyone has to start at
the bottom sometime.

I think they'll become more than competent with time and experience.
Either that, or they'll get bored and take up another hobby. Few
people keep doing hobbies they're not enjoying because they not good at
them.

Some observations about CITY hams vs. COUNTRY hams:

Out here in the rural areas, there are so few hams that it takes ALL of us together to just get a club going. The CW ops and the Phone ops are in the SAME club. The HF-ers and the VHF-ers are in the SAME club. The packeteers and the ATV-ers are in the SAME club. The "Elmers" and the newcomers are in the SAME club. The DX-ers and the ragchewers are in the SAME club. We get together and get to know more about what each other does. Not only are all these guys in the same club, but when they use a VHF FM frequency to chat on, they all use the SAME repeater (146.76) which ranks way up there in how busy it is. I know of only a couple big city repeaters that are busier.

In the big city, there are enough CW ops to form their own club. There are enough Phone ops to form their own club. There are enough HF-ers to form their own club. There are enough VHF-ers to form their own club. There are enough packeteers to form their own club. There are enough ATV-ers to form their own club. There are enough "Elmers" to form their own club. There are enough newcomers to form their own club. There are enough DX-ers to form their own club. There are enough ragchewers to form their own club.

Most of those clubs also have their own repeater and even if it is an open one, tends to be frequented by a particular group. That means that with the exception of community based clubs, most hams have very little opportunity to meet hams different from themselves. Just think of the prospect of joining ALL the clubs in the area. It could also be an effort to limit communication to "one's own kind". When someone "else" comes in on the repeater they are usually less than welcome. Travelers are tolerated but regular use by "outsiders" is discouraged by attitudes. Thus what results is that there is significantly less use of the many repeaters already in existance.

I have traveled on occaision to the following cities since becoming a ham and had radios available to me when I did: Indianapolis, Dayton, Columbus, San Franscisco, Houston, Dallas, and Chicago (suburbs). The level of activity was INVERSLY proportional to the Community size (limiting the times I was in Dayton to NON-hamvention weekends).

If there is congestion in the big cities, it is in terms of the number of repeaters coordinated and online, BUT NOT in terms of the number of actual ham radio operators using them. There even seems to be A LOT of cause for city hams to become INACTIVE (and not all on the radio, such as antenna restrictions in "bedroom" communities).

My point here is that "congestion" is often claimed, but has not been actually observed. If you know of a city, and particularly a repeater frequency in that city, that is congested, please post it. I may even come to visit your city to hear this rarity. Maybe I can earn a "worked all congested repeaters" award :-) (if I can GET IN) :-)

Last night the Champaign Illinois 146.76 repeater had about 2 hours of on-air time somewhat well interspersed between 12 midnight and 6 AM. This level of activity is actually quite commonplace here. How many big city repeaters can do this. When I was in Dallas recently, I tried all the repeaters on 144 Mhz and 440 Mhz in the repeater directory, and found about 20 (13 VHF and 7 UHF) that I could bring up and came in full quieting on my dual-band HT on low power in my hotel room. I left the radio scanning these 20 frequencies all night. Between 10:30 PM and 1 AM there were 2 QSO's, one about 10 minutes long, and the other about 30 minutes. From 1 AM to 5:30 there was NOTHING AT ALL. At 5:30 I was woken up by a guy who called for another station over and over for about 15 minutes before he gave up. By 6 AM there started to appear to be some "drive time" activity, but it was Saturday so I could expect there to be much less than usual.

Is 2 meters congested in the big cities? I think not.

>amusement, horror, and deja-vu.
>My question: *WHY* do we want *MORE* hams? Surely, its a fact that as the
>numbers go up, the quality comes down.

Two points. First point is that the average age of current amateurs is around fifty. This does not bode well for the future of the service. Therefore we need more, hopefully young, hams to provide for the future of the service. Second point is that "quality" of hams probably follows a bell shaped curve. As we get more hams, we get more good hams as well as more bad hams. The average quality stays the same, but in absolute numbers we wind up with more good hams.

>(If you really want *more* hams, why not just sell licenses by mail-order
>and then you could have charging based on number of band segments
>or privileges).
>No seriously, I think we should be encouraging RAISING of standards, not
>lowering them. Make the test harder and introduce a code-free license.
>(I am against the UK 'Novice licence'; IMHO it can do nothing but harm...)

If you are a HF DXer or contester then more hams is a bad thing. However, if you care about technical innovation, emergency service, introducing young people to technical careers, or the long term future of amateur radio, then more hams is a good thing. It all depends on your point of view.

Check with the local hams to see where the activity is located. Different areas use their spectrum differently. If really interesting things are happening locally on 220 then go that way. Otherwise go with the 440 equipment.

>
>==> Does anyone have experience with this radio... Or can someone suggest a
>==> better rig than this ???

This is a nice feature packed radio. It does tend to run a bit warm and an external fan might help in some installations. I am personally biased toward Icom radios since I have had very good experiences with them, but the 731 is a very good dual band solution. Yeasu and Icom make very good radios as well and I can recommend the FT4700H or the IC2400. Basically they are all good radios, the primary differences are due to the way features are implemented. You may like the Kenwood way, or the Icom way, or the Yeasu way best based on how you like to operate and how you like to think about how controls should work.

>
>I'm very much intersted in using this for packet. I will shortly be going
>through similar buying trauma for a TNC.
>
>==> Any TNC recommendations ? And software that can be used with a Mac ?

I would strongly recomend that you not try to use one radio for both
voice and packet unless economics forces you to. Quite often the ability
to talk over a problem you are having with new packet techniques is
invaluable. In general, a simple cheap used crystal rig will be ideal
for packet. I would recommend the IC22a or the TRC22 or any of a number
of used commercial two-way radios by Motorola or GE. In the new equipment
market, Kantronics makes a nice little crystal rig designed for packet.
As for TNCs, MFJ, Paccomm, Kantronics or AEA, they all work. Get the
cheapest that has a standard TAPR style modem disconnect. Currently I
am using MFJ1270 and Paccomm Tiny 2 units. Red Ryder will get you started
as far as software is concerned. There is also MacPacket and others.
When you are ready for more advanced work, there is the KA9Q TCP/IP package
available with source for the asking.

>I'd like to get good eqipment, with basically everything from the start ..
>.. rather than picking up odds and ends along the way. The latter being,
>I think, more expensive than the former.

This attitude could prove to be disapointing in the long run. Today's
wonder box is tommorrow's worthless clunker. The technology of packet
is changing too rapidly to justify buying one of the current do everything
boxes. They tend to do everything equally poorly. You can add high speed
modems to your plain TNC if that becomes popular in your area. You can
add a really good HF modem to your plain TNC if that becomes your interest.
You can even discard your cheap TNC and get some really good RTTY equipment
if that becomes your interest. The do everything boxes tend to be closed,
and as technology changes, can be very difficult to upgrade. Sort of like
a Mac :-).

At least half the fun of ham radio is the tinkering, modifying, experimenting,
and horse trading involved in getting the "ideal" setup. Don't settle
for applicance operating.

I think "competence" is an adequate licensing requirement. "Excellence"
is what we should all strive for AFTER we become hams. Amateur radio
should be a continuing lifelong quest for knowledge and no amount of
wallpaper can substitute for the inner drive to learn.

4547. Advice wanted - 2m HT

Newsgroup: rec.ham-radio
Date: 1990-07-25 09:29:20 UTC
From: JKOSS00@RICEVM1.BITNET
Message-ID: <1724JKOSS00@RICEVM1>
Source record: 9906

I'm thinking about buying an HT when school starts this Fall. I'm looking for advice regarding the following:

1) Brand: I've seen several advertisements for Alinco HTs and they're significantly cheaper than their ICOM, Kenwood, and Yaesu counterparts. Are they good rigs? Is the price difference mainly due to the fact that they're not as well known as the big 3, or is there a quality difference as well? Any preferences among the big 3? Do ICOMs really survive a 300m drop? ;-)

2) Band: According to what I've been hearing on the net, 2m is a zoo and 70cm is empty. So, the question is whether I should get a 2m or 440MHz HT. I can not afford a dual band rig unless I go with the Alinco [see above] and I'm of the impression that 220MHz is barren. I guess it is a matter of personal opinion ... so I want to hear yours. Note that I have ONE friend that is a ham and he won't be buying a rig anytime in the near future, so ...
[I know - I'm working on getting another friend into amateur radio, but it aint easy to motivate 'em.]

3) Why: Should I even bother getting an HT? I saved some money from my summer job and I can spare about $400 for goodies, after books for Fall semester, new glasses, etc. I've been thinking that the 400 bucks should go toward an HT, but I'm open to suggestions from more experienced hams. I don't own any rigs but I have access to RUARC's HF reciever and xmitter when I get the urge. Oh, btw, I've a tech license.

Any suggestions on the three topics above would be appreciated. In the interest of saving net bandwith, I encourage e-mail replies unless you think it is of general interest. Right now I'm leaning toward the Alinco 2m/70cm dual bander if I can find it on sale, or one of the 2m Alinco HTs. If you know any reasons why this would be unwise, I would really like to hear your reasons. tnx es 73

Why not do away with the radios entirely and use the WA4DSY Grapes high
speed RF modem. It is a Minimum Shift Keyed Quad Phase Shift Keyed 56
kilobaud modem ouputing 5 milliwatts of RF on 28Mhz suitable to drive
a transverter to the VHF/UHF band of your choice. Thats a MSK QPSK 56K RF
modem available for the past two years as a kit from your friendly
Georgia Radio Amateur Packet Enthusiastists Society. It occupies a
70Khz spectrum (1.2hz per baud) so look for transverters for 220 and above.
It can be slowed to 19.2kbaud by a jumper change if you must use it on 145Mhz.
Send email to ...gatech!kd4nc!dug for an info sheet.

I have seen several applications of running PCs on 12v and on generators using an UPS as a line conditioner. An outfit in Wisc called BEST as what I feel is the best UPS on the market (personal opinion of which I feel perfcectly entitled, no flames please). They have files of several customers who use a 12v system through an invertor and then through their ferrups unit to give "computer grade" power. Their unit also works extremely well on generators to give a good clean regulated, filtered, output. I have seen the output from these on a scope and I am satisfied. As soon as I can afford my new computer you can bet on of BESTs UPS units will be included.

A simple note that in regard to those Q-signs, virtually all of these procedural signs come in two varieties. With a question mark (?) they represent a querry while when sent on their own or with information are either a POSITIVE response to the querry or are a mark prefixing the information requested.

QTH? = what is your location
QTH NYC = station location is NYC

Note also that some Q-signs when stated as querries also require an information field. This form is less often used in general contact work (I can't even remember an example myself) and is often not used in net work as the information field is frequently implied by context.

Keep listening to nets and on the air, your QSO style will develope to what suits your preference and will not be too far off "standard".

Cross-posted to: rec.ham-radio,rec.radio.shortwave

I have read about "Steerable Wave Antenna" (SWA). It sounds like very
good antenna for our purposes : MW-dxing. It has a very great property :
it has two beams (A and B), depending how wires are connected in the receiving
end. It's also possible to adjust null angle vertically.

SWA has 2 wires, > 1 lambda each (1.5, 2...)

```
<------- A beam B beam ----------->

|-------------------wire 1-------------------------
|-------------------wire 2-------------------------
| |
Rx gnd
```

(Wire 2 is grounded in the end while another one is left in the air.)

I would be interested in to know if anyone have any experience about
SWA.
-How well they work?
-How near wires can be? (We have a lot of old telephone cable with 2
wires, but those are less than 0.5 inch apart)

> in some areas (e.g., Chicago, where summertime tropo openings are extremely
> common) while other areas (e.g., NYC) resist it.

This is why all new repeaters coordinated by T-MARC (Middle Atlantic Repeater Council) will use PL from Day One. For one thing, they will start out on a "Repeater Builder's Channel", 145.17 MC which, since it is shared, requires PL from a practical standpoint. Once a frequency with minimal co-channel interference is found, that freq. is assigned the lucky new operator, and the PL access remains in place.

T-MARC makes it clear that there is no such thing as a "clear channel"; anyone who wants a clear channel is invited to investigate 900 MC and up!

It's about time ham repeater operators crawled out of the 1960s and realized that in order for everyone to have his own repeater fiefdom, technological advances such as PL must be utilized to the fullest.

Interestingly enough, in aviation, a common slogan used for people getting their private pilot licenses is that it is a "license to learn". I've always kept that in mind with regard to amateur radio and believe that it is a good model for how licensing should work. A license should ensure that the licensee is safe, legal, and competent. Once the license is granted, then the licensee can get on with the business of becoming expert. Until you grant the license, the licensee can only acquire limited experience, and therefore, will never be truly expert no matter how much testing you do.

> enlighten me on OscarPacket and the feasibility of putting a BBS in
> space.

They are already up there. Two UoSats and two Microsats include BBS
capabilities. (Although the software is still under development). And
the Japanese satellite (FO-20) is routinely carrying messages in its
BBS right now. The microsats can be accessed using omnidirectional
antennas, so portable Earth stations should be no problem.

Of course, the satellites may not be overhead when you want them,
so unless we can put up a _lot_ of them and link them together,
they probably will never play a large part in emergency communications.
(I'm speaking of LEO satellites, of course. A Phase-4 satellite
would be a different story.) So, effective HF communications are
necessary. That's one reason why ARRL is funding research in the
area of HF packet development.

4560. Should I become a ham now or wait?

Newsgroup: rec.ham-radio
Date: 1990-07-25 14:06:43 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <1990Jul25.140643.25493@chinet.chi.il.us>
Source record: 10007

As an outgrowth of my 2 years in the SWL hobbie, I've become very interested in talking as well as listening. In addition, the technical aspect of transmitting are as interesting to me as are the ones for listening. Finally, both packet holds interest for me as a crossover for my interest in radio and my interest in computers.

As I've been learning about ham radio it seems the hobbie is in a state of flux now, especially over the proposed "communicator" license. There is much debate about how and even why new hams should be licensed.
Code requirements seem to be a subject of both intellegent discussion and of mindless debate.

All of this is interesting but for myself it all boils down to this: Is getting a novice ticket now a desirable thing? Will the license structure change so radically or so differently that I will have wished I had waited? Will digital modes, commercial interests stealing freqs, no code, and the "decline" of ethics among operators so change the hobbie with in a few years that what I see that I like, the chance to share my love of meeting new people and friends who share a common technical and tinkering interst be gone?

Or is the best yet to come? I feel somewhat strange attending my local ham radi clubs meetings as I'm 27 and everyone is so OLD. On the other hand, I have a friend who is a 12 year old extra... but he didn't join the club becuase "It's judt a bunch of old guys who hate me because I'm so young." Is ham radio an "Old man's hobbie" where young people are looked down upon? It doesn't seem that way from what I hear on the air, but it seems to be at ham fests and other gatherings I go to.

Botton line: I'm learning to love radio and ham seems like the next step for me from SWL, but I have some questions and reservations I'd like to see public comment on.

>Or do you want them to become expert professional hams somewhere else
>before we let them on our bands?
...
>Get real.

(Thanks, I needed that. (how do you draw a sarcastic smiley face))

>Everyone has to start at the bottom sometime.

Certainly, you are right ... but the argument was "get rid of license
classes" (at least, make "entry level" and "full privileges" flavors).
I am saying, the overall quality of hams owuld fall, because either:

(1) the exams would become too hard, and people would not
pass
(2) the quality of the exams would drop even more so than
what we have now

People learn in little chunks. Take a look at television, and the fact
that shows (entertainment _and_ news) are given to us in 12-minute chunks.

I think that it's preferable to have five short-term goals, as opposed
to a two-step arrangement, where the quality would fall further.

So, the answer is no, they don't have to be experts right off the
bat. And yes, I _do_ expect them to be more than competent once they
hit "full amateur privileges".

(As an aside, I work the novice bands on CW considerably more often than
I work the extra portions. Anybody who has the "snob" attitude of not
wanting to work novices is an idiot and not worth consideration).

Cross-posted to: rec.ham-radio,rec.radio.shortwave

The Kenwood RZ-1 is a .5MHz to 905MHz AM/FM/WBFM receiver.
I thought I'd share my observations on the RZ-1 birdie problems.
If anyone else has experienced this problem speak up!

The spectral composition of the birdies appears to be coming
from the uP control board. This 'trash' is then coupling via
ground loops. I say this because as I removed the i.f. board
from its mount (ungrounding it from the metal chassis) the
birdies when down in amplitude. Also when the unit first
powers up, it delays for 4 seconds before scanning the LCD
and keyboard. During this time the receiver sounds quiet
and free of birds. I therefore concluded that its a EMC
problem with the on-board uP.

If I find the ultimate solution to this problem I'll post it.

>aluminum under the puddle with the soldering gun or iron.

Yes, this works fairly well when all you need is a good electrical
connection. However, there also exist solder/flux products specifically
designed for soldering aluminum. Both Weller (separate solder and flux)
and Kester (flux in core of solder) make such products, and are typically
100% tin with a very active chloride (i.e., acid) flux. I prefer the
flux-core type, since it does a somewhat nicer job. The job requires a
propane torch for the high temperatures (~450 F) involved, not to
mention the high thermal conductivity of aluminum.

I made a wonderful and very lightweight 2-meter beam with a shower-curtain
rod, 10-ga. aluminum wire, and the Kester stuff. I found that when the
temperature is just right, the joints sweat-solder as nicely as
Pb/Sn on copper. Voila: no heavy SS bolts, no corrosion problems.

Drawbacks: Only alloys with a high aluminum content (60-61, 20-24) work
well with the tin solder. Also, I found it difficult to make
nicely-flowed corners when I attempted construction of an aluminum
enclosure. Looks like brass, steel, & copper are still the best mat'ls
for homemade boxes.

> One word of warning: DON'T use a fancy plated soldering iron tip!

Ditto with the aluminum solder -- the flux will eat a hole in your soldering
iron tip. Use a torch.

Assuming you are talking about the voltage at the 50-ohm output, just use
the formula E = SQR(P*R) and multiply by 1.414 to convert from RMS to peak.

For 100 watts, E = SQR (100*50) = 70.7 * 1.414 = 100V peak. With a 2:1 SWR,
the voltage can be up to 1.414 higher or 141 Volts.

4570. Re: G5RV antenna

Newsgroup: rec.ham-radio
Date: 1990-07-25 17:13:55 UTC
From: krl@jujeh.mlb.semi.harris.com
Message-ID: <1990Jul25.171355.20146@mlb.semi.harris.com>
Source record: 9924

I recently ordered the quarter size version of the G5RV from Antennas West, and what I received was not exactly what I expected. For starters, I ordered the quarter size because I have limited space in which to use it and am content with 20 through 10 meters for now.

When I talked to Antennas West on the phone, I was assured that an antenna tuner was not required when used with a transceiver such as my Heathkit SB102. When the antenna arrived, however, the documentation clearly indicated that the antenna would be reactive at these frequencies, and that the antenna would operate with a high SWR. Since my transceiver is rated for operation at a 2:1 or better SWR, I have not been willing to operate with it without a tuner (unless I see someone else doing so without cooking the final, at least. Never mind someone just telling me so).

The other strange thing is that the person at Antennas West told me was that the antenna kit would be shipped the next day by air, which seemed remarkable enough at the time. When the kit arrived three weeks later, I knew the people at Antennas West were not to be taken at their word.

Despite all this, the antenna appears that it will serve my purpose well enough when I get a tuner, which I intend to do eventually. Also, the kit was nicely packaged and easy to assemble, so that it seems a reasonable value. It is just a shame that the person answering at Antennas West has a poor sense of humor or is a compulsive lier, which strikes me as a poor way to run a business. While I don't rule out ever bying another Antennas West product, I can no longer believe anything they tell me about their prouducts or service, which lowers the probability that they will ever get another order from me (and possibly those who hear of this).

>amusement, horror, and deja-vu.
>My question: *WHY* do we want *MORE* hams? Surely, its a fact that as the
>numbers go up, the quality comes down.
Well, there may be some truth to that, regardless of where you
live. Noting your call and email address as a UK person, you
perhaps do not feel the concern here in the states over loss
of spectrun to commercial interests (on the other hand, you may
have a similar problem).

In the US, government tends to work like:

Group A feels threatened over the possibility of losing
some privelege. Realizing that they are a minority of the
total US population, they bring in more citizens into their
"sphere of influence". This increased number of Group A
now has a larger influence with the elected representatives
and thus swings a bit more weight in the decision making
process.

It is a rule by majority. I cannot claim any knowledge of
how this kind of thing goes on your side of the pond. :-)

>(If you really want *more* hams, why not just sell licenses by mail-order
>and then you could have charging based on number of band segments
>or privileges).
>No seriously, I think we should be encouraging RAISING of standards, not
>lowering them. Make the test harder and introduce a code-free license.
>(I am against the UK 'Novice licence'; IMHO it can do nothing but harm...)
I have nothing against maintaining a reasonable standard.
However, we already have a large number of jerks as hams in the
U.S. prior to the "Proposed Communicator" (and in fact, there
are some outside the US as well - it would be snobby of me to
suggest that the US has cornered the market on jerks :-)).
When dealing with individuals who join a hobby out of a large
group of citizenry, there will inevitably be bad apples. No
test is going to weed them out if they are justt nasty persons.
If he is so inclined, he can mark the right answers on the test
and when he gets his ticket he'll just go back out and do what
he wants. In order to do anything about these kinds of problems
you are going to need enforcement, which in the US means either
directly from the FCC OR something like the ARRL "OO" type
of program (yes folks, you heard me say something positive
about one part of the ARRL.....)

Except for CB, aren't all the other services you list above 30mhz?
I'm no expert on the ITU regulations, but my understanding is that the US
regulated CB (e.g. low power, antenna limitations, etc.) to keep
it a "local" service (i.e. range is typically limitted to 5 miles).

The RC (radio-control) frequencies are also in the 11-meter band which
requires no license.

Also, police officers, ambulance drivers, cell phone users aren't "amateurs".
They are public services or business related concern, while CB is not at
all public service or business related. I beleive it falls under the
category of point-to-point personal radio, like the devices for use
on 49 Mhz.

Seriously, I too am curious why the Citizens Band exists and why it doesn't
violate ITU regulation. I know of other countries where CB radios are very
much ILLEGAL (without the appropriate lisence). (In the Philippines the
local village police used them for communication.)

Well, the regulation isn't closely enforced; for example, the US ham code test doesn't require the applicant to prove he can send code with a key, even though the international regs would seem to require that. (Hey, since the US is already flouting international law, why not just abandon the code test entirely! Yeah!)

But as far as CB goes, one key remaining difference is that hams are permitted to build their own equipment. No other service is. The fact that few hams DO build their own equipment isn't material; we're allowed to.

I understand your concern, my old call was WA1DYU, Dumb Yellow and Uncordinated.

It could be worse, tho, one of my friends has the call: N0CH
You can imagine the phonetics I've been able to generate for his call.

Get your extra and hope for a 2X2.... (one advantage of having
an extra class license for those of you out there bickering about
communicator license vs incentive licensing.... ho ho).

73's es Good Luck!

George Noyes, W1XE

The CB radio service is not part of the Amateur Radio service. If this
were a requirement for ALL services below 30 MHz, folks who work at
AM broadcast stations would have to know the code.

> to Morse code. I know, that it's based on the frequency of the letters
> (i.e. E and T are the most used letters, so they are the shortest).
>
I have been told that the Morse code is based on this, that the most frequently used letters (in the english language) are the shortest, but I don't have any reference material that desribes this.

> Do you happen to have a diagram that shows this relationship?
> Basically, I'd appricate any other hints or clues for learning this code.
> I usually can learn things much easier, once I figure the logic behind it.
>
You could just lay out the code in asending order of length. Remember that a "dash" is three times the length of a dot:

So the shortest letters would be:
E .
I ..
S ...
T -
H ....

Then maybe:
A .-
N _.

etc....

Personally, I don't see how this logic would help you learn the code. It may be interesting, or maybe studying this will help you to remember (the same way that memorizing does, by association)..... But to build your speed, after you have memorized the letters, practice, practice, practice. Idealy, you DON'T want to memorize the code, you want to LEARN it.

You want copying code to become an "automatic" reaction (of course this is the ideal situation). So when you hear a letter, your fingers automatically write down the letter, without your brain "thinking" about it. You don't want to think in dots-and-dashes..... but hear characters directly. Later, when (and if) you practice enough, you will begin to "hear" words directly.

I almost attained this level, I can hear certain frequently uses words like:
NAME, RST, QTH, AND, THE.... but not enough to copy in my head!!

Of course, some say don't write anything down, start by copying in your head!!
Well, I have yet to see anyone PASS THE TELEGRAPHY EXAM by copying in their
head, and just jotting down a few notes.... some may have done this, but with
a few years of being a V.E. (Volunteer Examiner), I have NEVER witnessed
anyone passing an exam this way.

Others will tell you not to bother to learn the code, just memorize it enough
to pass the exam. This is up to you, if you want to become proficient with
Morse code (and have an easier time learning it), then (in my opinion) don't
memorize it, learn it!!

Good luck, I hope this helps. Morse code can be FUN if you give it a chance!

Re: NiCad charging (passing on info I just gained myself)

> How do I tell when I need to charge the batteries?

When they are discharged to the point where the radio won't run. If you need to do a full charge and they're not discharged and you don't want to risk overheating them by overcharging them, first discharge them. Put a 12V, relatively low current light bulb across the contacts till it goes dead. Then do a normal charge.

> How long do I need to charge the batteries for? (The manual says 15
> hours regardless of battery pack size.)

Then believe it. They're probably charging at 1/10 C (capacity), which is relatively inefficient, so it takes roughly 15 hours. Also, 1/10 C is low enough that the exact charging time is not critical. Not much heat is dissipated if you overcharge.

> How do I know how much battery life I have left when in the field?

You can't tell. One of the features of NiCads is a rather flat discharge curve -- the voltage doesn't drop more than about 10% until about 90% of the energy is exhausted. In theory you can measure the voltage AND TEMPERATURE and get some rough idea of the charge remaining IN A GIVEN BATTERY PACK that you calibrated earlier. Unfortunately the voltage is sensitive to both charge and temperature.

> Does the unit just die when the batteries run out or what?

Probably, I don't know, read the manual. My Yaesu turns on a little blinking indicator -- for about 30 seconds -- that I've never noticed unless looking for it. Always goes out during transmit, too. Moral: Spare pack stays charged and with the radio.

> How long can I store a charged up spare battery pack?

NiCads self-discharge on the order of months. So, rotate the packs. For short term storage (less than six months?), start with a charged pack. For longer term, start with a DISCHARGED pack. They can be stored for years without problems, though a couple of cycles might be needed to reinvigorate them.

I'm told the NiCad memory effect is largely due to cell differences in a battery pack. You can counteract this problem two ways. One, fully discharge the pack occasionally. The less-charged cells will go into reverse, but there's a "buffer zone" in how they are constructed before real harm is done. Meanwhile the more-charged cells are brought down in sync. Two, overcharge the pack with low current (1/20 C to 1/10 C) now

and then. This won't hurt the fully charged cells (long as they don't get too hot, you see), and it brings up the less-charged cells.

One more tidbit. For reasons that are unclear to me, trickle charging NiCads (usually at 1/20 C), while it keeps them "ready to go" at all times with all cells fully charged, is the only typical practice that reliably destroys batteries within 3-5 years. Probably because there is energy constantly available to degrade the electrodes.

While not yet having attained Extra, I also think incentive licensing isn't doing what was envisioned. On the other hand, I don't begrudge the Extras their occasional 25KHz playpens. It IS a little annoying when I accidentally key up in Extra-Land /.\ It seems that there are better things to remember than all the frequency boundaries.

Here also is another EE-type that took the Advanced written 3 times :-o

If the ARRL wanted to abolish incentive licensing, I would consider joining.

> Question: what should I do when I need to tune up on the air
> before transmitting the QRL? (e.g. setting up an antenna tuner
> or testing a new antenna)?

All the transmitter Plate/Load stuff can be done into a dummy load.
Another trick to minimize QRM is to initially tune the antenna tuner for
maximum noise on the receiver. I tune the tuner with low (<10 watts)
power, get it into the ballpark, then use full power for the "?" -
listen - "QRL?" schtick. Hearing nothing, I then touch up at full
power.

> But what do you send if you didn't copy everything?
> a) if you don't plan on asking for a repeat?
"R" :-)
> b) if you missed something specific, like a name?
"name?" or "QTH?" or "my RST ?" right up front, followed by "bk"
> c) if you want some unknown information repeated?
"rpt after XXXXX" or "no copy - pse qrs bk" if you're really lost.

> Asking HOW COPY? seems to be a common practice on the novice bands.

If the other guy has a poor fist, it's usually a good idea to send this
at the speed he sends, right up front. It's a real drag pounding out
your name, QTH, and his RST, then getting back "no copy".

I think the key is that if there is a good (but not great) SW under
$200 it doesn't get full page color ads because there isn't enough fat
in the price to cover them. It would get 1 or 2 square inches in a
discount dealer's add in the Sunday New York Times and the assumption
is that you are already familiar with the model numbers.

Review: ICOM IC-R1 Portable Scanner
Paul Flaherty, N9FZX

By now, just about everyone has seen the ads for ICOM's new wideband receivers. And, by now, just about everyone also knows that the R1, and the R100 are not available in the US, and will not be for some time, due to production problems as well as legal difficulties. However, for a few hams who are lucky enough to be able to travel to Japan on a regular, it is possible to buy an R1. The list price is Y54,000; actual prices vary in the Y43,000 to Y48,000 range. This translates to around $300US, certainly not bad for a miniature wideband receiver.

I bought my R1 in Akihabara, where I lucked into finding a store that didn't have a waiting list. Since the manual was in Japanese, it took me a while to investigate all of the features (Watashi no Nihongo wa totemo heta desu). I've had about three weeks to play with my R1, so I thought I'd share some of my experiences.

As per the ads, the R1 synthesizer does lock up from 100 KHz to 1.3 GHz. However, an amount of S1 hash limits the useful starting frequency to 200 KHz. Birdies are quite frequent below 10 MHz, generally four per megahertz, each 20 KHz wide. Above 10 Mhz, the design is a bit cleaner, averaging one birdie per 10 MHz. Above 100 MHz, things improve further still, with one birdie every 50 MHz, with the exeception of the range 275-300 MHz, where birdies are quite frequent. With the exception of one birdie in the 6m region, all of the ham bands were quiet. 400-500 Mhz was also very quiet, as were most of the SWBC bands. Some of the birdies are obviously LO mixings, while a few of the wider signals are microprocessor hash.

The R1 comes with a wideband VHF-UHF scanner antenna, which is adequate for most purposes. For shortwave reception, the antenna does suprisingly well during the evening hours. I've tried attaching an external antenna to the R1; unfortunately, this only exacerbates the adjacent channel interference problem that I'll discuss later. But, even without an external antenna, WWV reception is solid, and I've had lots of fun listening to Radio Australia, Radio Japan, Radio Moscow, Havana, the BBC -- in short, the rig is indeed useful as a shortwave receiver. The best reception seems to be in the 9.5MHz and 13.5 MHz bands, although I've listened to stations in the 15 MHz and 6 MHz bands as well.

VHF and UHF coverage is also very good. I've programmed a number of local public service frequencies and ham repeaters, from 52MHz to 1.3GHz. The sensitivity lags somewhat above 900 MHz, but everything below that is solid. The state park service has a repeater in the 800 MHz region quite a ways from here, and it's fun to listen in, especially during the weekends.

Since the ICOM ads don't mention the sensitivity figures, I'd figured that this was where the compromise would be. That's not the case, as one can see from the figures I've posted earlier.

Instead, the compromise was in selectivity. The R1s will lock up on very strong signals that are as much as 40 KHz away from the desired signal, depending on the frequency involved. In the case of AM broadcasting, KFS shows up in lots of places, and is omnipresent if I connect an external antenna. This isn't so much of a problem for SWLs as for scanner folks, since the scanner will stop on a channel that's open, but has a carrier less than 40 KHz away. I've been able to mitigate this problem substantially by keeping a tight squelch, but it still does pop up from time to time.

The R1 has all of the usual wiz - bang scanner features that one would expect, including selective memory and range scans. Scan rate is variable from 10 - 20 channels per second. There is a configuration mode, where the scan rate, division of memory, power consumption, scan stop / start policy, display contrast et al can be changed as desired.

As is the case with the IC-SAT line, the R1 has a built-in NiCad, and the radio itself will operate off of any source between 6-16VDC. When the source is above 12V, the power circuitry automatically charges the NiCads. The documentation doesn't specify the capacity of the on - board Nicads; I've heard both 300mah and 180mah. The radio draws 15ma in squelch, and as much as 300 ma with the volume pot cranked all the way up. I bought a BP-90 AA battery shell to tide me over while the NiCads charge.

My overall impression is quite positive. The R1 packs a considerable degree of capability into a very small package, that's very inexpensive. It does have its flaws; however, the birdies are generally out of interesting places, and the selectivity problems are annoying but not intolerable. I've really enjoyed being able to listen to shortwave via a radio I can clip to my belt (without feeling too geeky).

>Why does everyone keep talking about ham radio in an emergency .... maybe
>the ARRL is behind it ...

In the hours following the Oct. 17th earthquake here in the Bay Area, all communication systems were down. Telephones (including cellulars) did not work until about 9pm. (The quake happened at 5:04) All sorts of incorrect information was being reported over the commercial TV and radio stations. ("The Valley Fair Mall had collapsed - several collapsed bridges over highway 101 - UC Berkeley library on fire - complete collapse of the Bay Bridge", etc.) The much balleyhooed "Emergency Broadcast System" failed completely. The only way to get accurate information was via ham radio. The only way to get messages in or out was via ham radio.

By the way, this was a relatively minor disaster. There was almost no damage in my area. In a really catastrophic quake, ham radio would be the only communications available for days.

No, this is not an ARRL plot ... hams ARE essential when disaster strikes!

Peridically I get the feeling that radio ... is getting far too hard
to do - you need 99%+ pure Ge/Si ... and huge factories and $00000000.

One the other hand:
You can make resistors out of pencil leads, capacitors and
inductors are easy, headphones are possible (not easy) and you can
use Galena (lead sulphide I think for a diode), but what about things
with GAIN.

I've had this dream of making a triode in a peanut butter jar (a
small strong one :=) ...

Has anyone out there ever tried to make something like this or any
homemade semiconductors ....

And how about batteries with household chemicals (ie not sulphuric)

I can't be the only one who has these thoughts ...

Cheers
Giovanni

"Marginal communication techniques"? I hope you don't mean
deliberate interference with other stations, which I sincerely doubt
is covered by the Constitution.

>
>I've often wondered if the FCC's agreement with WARC is unconstitutional

I don't think that there is any real rule against discussing these
things, just a "gentlemens agreement" in order to prevent blowups
like the 20-meter business (BARF or whoever) that is mentioned so
often in this newsgroup.

Apart from swearing, business, false emergency calls, etc., most
of the rules limiting what can be transmitted deal with third
party communications and international communications; the main point
being the protection of government/commercial common carrier services.

Although it doesn't seem to be the case anymore, all trap dipoles
used to be called W3DZZ antennas. Still get QSLs from overseas
saying they use a W3DZZ.

> 2-fold to answer the need for code-free licenses.
> 1) 902-928 MHz / all modes / 100 watt power level

And what will you do in California, Colorado, Wyoming, Western Texas, and
Eastern New Mexico?

> 2) Non-standard callsign format (i.e. KX2RAF or a double digit numeral)

WHY? So you can label them and be able to refuse to talk to them or worse?

And why do you think it is "giving away"? Nothing is being given away to
Communicators.

> will be some cheating as far as privilages for operating. It should not
> be hard to distinguish codeless hams. I am not "labeling" them, I am
> merely creating another class of callsigns UNIQUE to all others. I used
> the example of "kX" to denote eXperimental. This also serve to all the
> paranoid that if an operator got on 2m, it would stick out somewhat.

But what if a Tech gets on 20 meters? Why not give Tech's unique callsigns?

What if the KX op upgrades? Can he keep the call he is used to now? Won't
that diffuse your ability to "pick them out in a crowd"?

There is no need for distinguishing call signs beyond the incentive nature
we have now, and even that isn't essential to ham radio survival. What
you obviously want to (be able to) do is to discriminate against them just
because they didn't want to learn code.

> This 2-point proposal for the communicator serves the purpose to give
> a band to codeless hams and foster the desire to move up to another class
> for more privilages. Opposed to the same old idea in the ARRL, lower
> the standards for higher numbers.

And what codeless class do you propose they upgrade to? Oh, I get it, you
want them to feel that ham radio is so useless without having to go ahead
and learn code anyway, that they will upgrade. Sorry, but that just won't
work. A few might be fooled by your trick and start out, but they will
become inactive because they still don't want to bother learning code.

> If the ARRL wanted to improve the image of ham radio, they would push
> standards higher than those of other services. These would be more technical
> and operational. Instead, contests are a big deal. They have even turned

Homemade semiconductors, other than diodes, may be a problem;
see below.

>I've had this dream of making a triode in a peanut butter jar (a
>small strong one :=) ...
You could do this successfully if you had some way of getting a
good vacuum. (Commercial valves have chemical compounds known as
"getters" which aid in removing oxygen from the valve)

>Has anyone out there ever tried to make something like this or any
>homemade semiconductors ....
Transistors, etc. would most likely be too difficult to make at home
because of the necessity for "clean rooms" (rooms with no appreciable
level of dust floating around. Dust will short-out a transistor,
integrated circuit, etc.)

>And how about batteries with household chemicals (ie not sulphuric)

There is a reasonable aluminium solder made by the British company Ersin Multicore. I am not sure how well this will work on aluminum over in the U.S. (-:

If you don't have the correct solder, here is a couple of tricks to amaze the hoi-polloi.

Pour some light machine oil (3 in 1) over the aluminium. Using a sharp blade (Swiss army knife, X-axto etc) scrape the surface to be soldered. Tin the scraped surface while the oil still coats it. Smelly job and liable to get you cited by the smog police. It works by keeping oxygen away from the shiny aluminum long enough to get the solder to flow.

The next method requires a grinding wheel (pretty coarse). Grind the aluminium surface and then apply solder to the wheel to coat it in solder. Now apply aluminum part to the wheel so it gets good and hot, the solder on the wheel will abrade the aluminum surface and heat the solder so it flows on the hot clean surface. Doing this is tricky. It can also be used to deposit solder on ceramic surfaces. For ceramic surfaces use a solder with 5% silver.

If you have ever wondered why they use aluminium for heat sinks, trying to solder it will answer all your questions.

>
> 3. If the regulation is so well enforced how does the CB world
> exist in the US under that ITU requirement ?

The CB world gets away with it because it is not an international
service. Remember the old NO DX rules? One of the strange things about
RF enforcement is that if it is for "National" use then the
international rules don't apply. How RF stops at borders I will never
understand, but most European MF (AM) broadcasters think it does.
Also Japan has no-code hams on some HF bands using low power. They of
course are only talking to other Japanese hams so do not need to meet
international regs.

>>Shouldn't we strive for a little more than "competence" ?

brian@ucsd.edu (Brian Kantor) replies:

>No, why? Were you an expert when you first got interested? I sure
>wasn't.

I think by "competence" Mr. Piggott meant being able to do more than turn the "o-f-f switch to the o-n position" and push the talk button. Numerous comments about Extra's that need to go to a hamfest to buy a 75 meter dipole deleted. The question is: How do you define the word "competent"?

>Ham radio operators do not spring full-grown from Zeus's brow; they
>grow in skill and capability as they gain experience.

True.

>Or do you want them to become expert professional hams somewhere else
>before we let them on our bands? Get real. Everyone has to start at
>the bottom sometime.

The bottom of what? There is a minimum entry knowledge level. It is NOT the bottom. When one can pass the test and understand nothing of the material that he was tested on.. there is a problem.

>I think they'll become more than competent with time and experience.

Sometimes yes and sometimes no.

>Either that, or they'll get bored and take up another hobby. Few
>people keep doing hobbies they're not enjoying because they not good at
>them.

Do you have to be GOOD at something to enjoy doing it? I do NOT think so Brian. I am not GOOD at woodworking, but I enjoy stumbling around at it. I am NOT good at fishing, but I enjoy it.

Then there is the matter of sex..... of COURSE I am good at that! :-)

As I see these religious wars about technology and spectrum use I am reminded of an article I read many years ago. It appeared either in "Short Wave Magazine" or "Rad' Com'". It was a story about a British amateur who by that time was an old fart, or to use the current vernacular, an old geezer.

He was discussing his early days as a radio amateur. He mentioned how he came back from WWI in France where he had been living in a hole in the ground covered in mud and lice. He and his peers wanted to get home and do some radio. To his horror, he found that the Radio Society of Great Britain was "Just a group of old men who wanted to sit around and talk about wireless when we wanted to get on the air." He had pushed the Old Farts of his day to get licencing going again so the young turks could do some radio. I wish I had filed that article.

We don't use spark anymore, and CW may be less relevant, but it looks like we still have a geezer problem seventy years later. As I approach geezerdom I wonder when I will be considered an impediment. Some of you may consider that time has come (-:

>hams operating on 2 meters and on UHF bands as well in the big cities, but
>FCC regulations cover the WHOLE country, not just the cities. And I think
>a rule that allowed Communicators on 2 meters ONLY in the rural areas just
>would not work.

Ok Phil.. let's for a moment suppose that the Novice License is saved. Where
THEN is the central meeting ground for ALL of HAM RADIO? Hint... Novices
already have 220 privileges. We need to populate 220.... and it has
propagation that (IMHO) rivals or exceeds that on 2 meters. Yes.. I like
the 220 band and admit I am opinionated about it.

Let's say that the current proposal goes through and Communicators get
"stuck" on 220. Are you going to push to get a repeater going on that
band? We did here for Novices, and we also put links on it to 2 meters
so that we had the OPTION to hook into it and talk to them, just like we
all have the OPTION to operate Novices on the HF allocated areas. I
believe that helping new hams should be an effort or project by local
groups and should NOT be the result of some regulation that says "here
they are folks, love em or leave em".

>> but just consider that for all practical purposes, there is NO difference
>> between 146, 222 and 440. They are ALL relativly local in coverage
>> (on average), they ALL have relativly simple equipment requirements
>> and they ALL have resident hams within easy distance over most of the

>About HALF of the country.

And whose fault is that?

>New hams will generally appear IN PROPORTION to the old ones. That is to
>say that if we see a 40% growth in hams, we will see a 40% growth in the
>urban areas AND a 40% growth in the rural areas.

Urban areas don't count... they already have 220 repeaters.

>BUT if Communicators do NOT get on 2 meters, then you will be getting what
>you say, because the Communicators in the rural areas will be getting NO

>(usable) privileges. So what you are arguing FOR will actually be the CAUSE
>of what you basing your argument on; so I suggest doing the OPPOSITE so that
>we do not see such a thing happen.

Possibly true if we don't get off our rear ends and DO something about it
instead of trying to "make elmers out of everyone on 2 meters or else".

>> So why are we forcing one group out to make room for another? That

>Because these groups need to communicate with each other.

Novices? Novices? Novices? Novices? What about the Novices?
This assumes that what you are saying has basis in fact. As another
poster pointed out, in urban areas 2 meter repeaters are highly segregated
into interest groups. If you ain't in dem der group... you ain't welcome.

>I would accept limiting Communicators to higher bands *IF* no more 2 meter
>only radios were being sold (except for recycled ones). If *ALL* NEW radios
>for the VHF/UHF bands had at least one COMMUNICATOR-CAPABLE band in them,
>such as the dual banders we now see being sold, then there would not be any
>issue left for putting Communicators on 2 meters. The only reason to put
>the Communicators on 2 meters is because so many hams presently HAVE ONLY
>2 METERS (as there VHF/UHF capability). Correct THAT situation and then
>there will be no problem.

We have.

>> one smacks of slum-lord tactics, later on the slum lord gets the
>> good press for "trouncing urban blight" by tearing down the slums
>> and erecting "AFFORDABLE" housing (with HUD money). Did any one
>> ask the slum lord who would be able to "afford" the housing?

>Make a point, please. Affordability is NOT an issue, really. If a new
>Communicator is on 2 meters, "Elmer" can talk to him, or buy a UHF radio
>and move up somewhere else. If the new Communicator is only on some UHF
>band, then the "Elmer" can also buy a new UHF radio to talk to him, or
>leave him alone.

EXACTLY! I like the last option. If elmer wants to help him he can buy
a 220 Mhz radio and do so, or your repeater group can FUND a 220 repeater
and help NOVICES too. Also don't forget that it is not too big a deal to
add a 220 remote base to existing 2 meter repeaters. Is the issue one where
you want to help the elmers by not making them buy rigs for those bands where
we need the most development.. and driving the non-elmers off of 2 meters?

This is getting interesting huh Phil? :-)

Best Regards...

Mark Bitterlich

>two meter voice privledges (and a one year nonrenewable timelimit),
>the Novice was able to go where the real hams were and join right in.
>He got plenty of help and encouragement.

So you are saying that the hams already on 220 Mhz, AVOID the Novices?
This is exactly what I have been talking about Gary when I predicted that
hams on 2 would AVOID the new Communicators. As far as the Novice selling
his 220 rig after he upgrades... Yes, I said EXACTLY the same thing in
another posting when I mentioned that a lot of Techs upgraded and bought
a 2 meter rig, and then stayed there forever. (That is not a dig on
"techs", it is just an observation of what I have seen in a lot of cases.
There **ARE** exceptions!)

Now wait a minute. Stop, cease and desist. Let's talk about "the old
days when Novices had voice on 2 meters". I was one of them Gary, I was
there.. I HAD that "privilege" (along with a simultaneous tech license.
Yes.. I was WA3JPY *AND* WN3JPY at the same time). What I remember about
2 meters was a Benton Harbor Lunch Box (AM) crystal control.. no repeaters
AT ALL, and about a typical 2-5 miles range (depending on how big of a
mountain you lived on). So you say the Novices were able to go where the
REAL hams were and join right in? What REAL hams? 2 meters then was like
almost 10 Ghz is today, hence my desire to have Communicators on 220 and
ABOVE. In addition the only thing you "joined right into" was a bunch of
static. Help? Encouragement? Only after the neighbors ripped my lips off
for tearing their TV reception to hell and gone! :-) Maybe if you lived
in the middle of a major city what you say might have been true... but not
anywhere else my friend.. and I was only 20 miles out of Philadelphia in
a place called Valley Forge. George Washington had better luck on 2 meters!

>Well prior to 1968 Novices DID have voice privledges on TWO METERS.
>The real point here though is that the Novice Class has always been
>considered a brief stepping stone on the way to becoming a REAL ham.
>The Communicator Class is viewed as a permanent alternative to the
>traditional license classes. Thus while the Novice will become
>socialized after he becomes a REAL ham, the Communicator never will
>unless he can freely intermix with the traditional ham.

What you say was true when the Novice License expired after one year.
Now it's good "forever". Novices ARE real hams. I like Novices more
than just about any other class. They are USUALLY the most eager to
learn and do not make any pretensions about knowing everything there is
to know about ham radio.

>>I still see the Novice as the basic entry level class... that is unless
>>they do away with it.

>No real argument here. I think the Novice license should be continued as
>a way for those who want to follow the traditional path into the hobby.
>However there are many people who would willingly study theory very hard
>in order to get a license because they understand that knowledge of
>theory is important to what they want to do with radio. Some of those people
>do strongly resist learning Morse Code, not because it is necessarily
>hard, but because they don't perceive it to be relevant to what they
>hope to do with radio. A revolution began in the 60s that has quietly
>taken firm root in the American psyche. That revolution said, in part,
>"Why should I be forced to take Latin to get a EE degree?" Ham radio
>still requires Latin for it's members and that has seriously hurt our
>recruitment.

If the test for Communicator Class requires one to study theory real hard
and has an exam that looks for knowledge, instead of an ability to memorize
answers then I say CW should be dropped like a hot rock.

Thanks for your reply Gary.

Well, actually, I've never made any vacuum tubes, but I have made some semiconductor material - there used to be these nifty science experiment kits that Bell Labs put out, and in one of them you made a photocell from a wafer of silicon, rat poison, and some other wonderous stuff. I like to think it helped me pass the semiconductor physics course I took much later in college.

My Grandfather, on the other hand, used to make triode vacuum tubes all the time. Of course, he was working for Lee De Forest at the time. (BTW, gramps was a ham too - his call was 2RH, and somewhere around here I have one of his licenses, signed by Herbert Hoover. He didn't keep any of the tubes, though.) He got bored with vacuum tubes and went to work as a test pilot for Igor Sikorsky. At the age of 85, legally blind, he used to race his motorcycle around the trailer camp where he lived down in Florida, terrorizing women and children alike.

And you guys think I terrorize the net? Just wait until I get to be as wild as grandpa was....

I routinely use the G5RV without a tuner when operating portable with my IC735. The SWR ranges between 2:1 and 3:1 on most bands. The Icom doesn't seem to mind this, but then Icom finals are noted for being tough. One time I mistakenly transmitted into an open coax. The radio dropped to about 80 watts but I had several nice QSOs before I noticed I didn't have an antenna connected! This is definitely not a recommended practice, but some of today's radios are more forgiving than others. I do use a tuner at home, a Dentron MT3000A which is four times the size of the IC735. I may be looking into a physically small tuner to take portable, but I'm not too worried.

The question works out to this: would you rather commit yourself to three weeks of study and be licensed NOW, or wait 18 months to 2 years for it to be "easier" to get the license? Communicator license aside, it seems to me that it's better to get the license now and be operating while all the hoopla is going on. I doubt that there'll be a point where you end up kicking yourself for getting the experience.

The theory exams for Novice and Tech are no big deal. If you sit and study the code twice a day every day for 21 dyas you'll be able to get past a 5wpm exam. At that point, you'll have everything the Communicator will have (no matter how 6 and 2 meters falls out) PLUS some HF privs *plus* all the time between three weeks from now and whenever the first Communicator license is received. Wadda they hafta do -- throw in the Ginzu knives? How can you possibly go wrong?

From: elmquist@nachos.SSESCO.com
Message-ID: <212@nachos.SSESCO.com>
Source record: 10019

Last time I posted something it was about the numbness of my R7000. Now it has been tuned up and works pretty well...except, I get many (too many!) images of the FM broadcast band throughout the passband of the receiver. I'm pretty certain this is due to the fact that I am line-of-sight to the tower facilities of all the FM broadcasters in the Minneapolis/St. Paul area.

I'm looking for a design or suggestions for a trap that will attenuate or remove the 88 to 108 MHz portion of the receivers passband. Has anyone else had this problem? Radio Shack sells an FM trap for TV/VCR usage (ie, it's 75 ohm) but I think I'd get alot more loss on other frequencies with that than I want to.

Any ideas? Thanks in advance... I'm tired of listening to Minnesota Public Radio on 146.34 MHz....

>The list price is Y54,000; actual prices vary in
>the Y43,000 to Y48,000 range. This translates to around $300US, certainly
>not bad for a miniature wideband receiver.
I got mine at Rocket Honten (main shop) in May and the price as translated by American Express was $298. I consider this excellent for such wide coverage and small size.

> I bought my R1 in Akihabara, where I lucked into finding a store
>that didn't have a waiting list. Since the manual was in Japanese, it took
>me a while to investigate all of the features.
>heta desu).
When I purchased my radio the R1's were in vast supply. I went to about 12 stores and they all had multiple units. As always Rocket had the best price as well as a sales person who spoke English and could demo the radio.
I have translated much of the manual and added many marginal notes. At some point I will key in the operating instructions. There are lots of features which are not obvious from looking at the radio.

>without an external antenna, WWV reception is solid, and I've had lots of
>fun listening to Radio Australia, Radio Japan, Radio Moscow, Havana, the
>BBC -- in short, the rig is indeed useful as a shortwave receiver.
I would say "useable" as a shortwave receiver. I found it to be fairly deaf. Yes, I can hear things that are 20db over S9 on my TS940, however, anything weaker is hopeless. Given the lack of sensitivity, the lack of USB/LSB is not a problem.

>
> VHF and UHF coverage is also very good.
In fact the coverage and sensitivity is so good that I would rate the radio as an excellent buy even if it did not cover DC-30MHz.

There is a built in speaker which does a good job given that the radio is so tiny. The R1 makes an excellent FM receiver. The Wide-Band FM mode has good audio quality.

>
> The R1 has all of the usual wiz - bang scanner features that one
>would expect, including selective memory and range scans. Scan rate is

>variable from 10 - 20 channels per second. There is a configuration mode,
>where the scan rate, division of memory, power consumption, scan stop / start
>policy, display contrast et al can be changed as desired.
You can scan all 100 channels (no banks) or and range of channels. You can also scan any one of 10 frequency ranges. One nice feature is the ability to dump scanned frequencies into memory.

I have not been able to get the display contrast setting to do anything. The contrast is good, however, the control has no obvious effect. There is a light for the LCD for night operation. You can also
turn off the "RCV" led to save power.

> My overall impression is quite positive. The R1 packs a considerable
>degree of capability into a very small package, that's very inexpensive.

I have enjoyed the R1 a great deal. It fits inside my shirt pocket. I have used it to follow air traffic control when I fly in planes and I take it with me when I travel.

I have used it to monitor cellular telephone and it does a good job of doing that. I was in Los Angeles this week and they seem to be using most of the available cellular bandwidth.

Friends of mine who have used the radio liked it so much they all want to buy one. Looks like I will have to bring back a case of them on my next trip.

You can certainly prepare for the license exam through self study.
Many people have. A structured course helps some people, but it
certainly is not mandatory. Get a copy of the ARRL Handbook for
the theory section, a copy of Part 97 for the regulations, and
a license manual and code tape and you should be all set.

Good luck!

Giovanni asks about homemade devices; well just as a demonstration I ran a
digital watch module off two series-connected lemons......
Use a copper and a galvanised nail into each lemon, series-connect, and
you get somewhere about 1.2 volts at a few hundred microamps. Enough to
run a LCD clock chip for some weeks (until the lemons run out of juice..!)
Spanish lemons seemed to last the longest. Tangerines were no good at
all. I tried a Jaffa Orange and got only 0.3 volts. Grapefruit give 0.2 volts.
Who will be the first to get the 'Fruit-powered' endorsement on their DXCC?
I have seen old diagrams for making thermionic diodes out of automobile
lamp bulbs by melting a wire through the glass envelope; how you do
this without destroying the vacuum is anyones guess. You could use one
hell of a lot of lamp bulbs this way. But back in the 1920's a single
diode tube cost a weeks wages so it was worth trying.
I remember my father telling me about electrolytic rectifiers; basically
a fruit-canning jar containing an electrolyte (Sodium sulphate?) and a pair
of electrodes (one lead flashing foil, the other a carbon rod) and
with four of these connected in a bridge formation, you could charge a
lead-acid accumulator by connecting the whole thing instead of the main
power fuse on your domestic AC supply.... Apparently when the current got
too high, the electrolyte used to boil over.... and smelt indescribably bad!
The lead-acid accumulator was all some people had to heat their tube
filaments in the thirties.... Anyone remember tubes with 2V filaments?
Just think, we dont have this hassle with 1N5401 diodes, do we?

> (2) the quality of the exams would drop even more so than
> what we have now

The question is do we want hams with expertise in radio or do we want hams with expertise in passing tests. One has little to do with the other. Amateur radio is among other things a place where we are supposed to improve our skills in the radio art through self study and experimentation. By requiring extreme test taking skill in order to allow the experimentation necessary to gain skill in the radio arts you create a self defeating circle. This emphasis on test taking skills demonstrates a mindset that says that I can't know anything because I don't have any wallpaper. I find this disturbing.

>People learn in little chunks. Take a look at television, and the fact
>that shows (entertainment _and_ news) are given to us in 12-minute chunks.

Speaking as one who makes his living in commercial broadcasting, I can tell you that the reason we give you programming in 12 minute chunks is so we can bombard you with the 2 minute chunks of commercials that pay our bills. I'm sorry if you have a short attention span, but don't use commercial television as a yardstick.

>I think that it's preferable to have five short-term goals, as opposed
>to a two-step arrangement, where the quality would fall further.

If your goal is to have that Extra Class wallpaper instead of the personal satisfaction of mastering a complex electronic circuit, then I feel sorry for you. You are free to set any goals for yourself that you like, but

that doesn't give you the right to mandate those same goals for everyone else.

]> telephone systems went down (for long distance service). Amateur 20 meter
]> communications did not. Even the US embassy was reduced to communicating
]> on 20 meters.
]
] Ok, high tech telco stuff in mexico city? But yes, there was a
]Strowger CO in a basement that survived. The building fell on top of
]it, but it just kept clacking away. To provide international telco
]connections, British Telecom had a satellite dish and T1 feeds flown
]in and operating within 24 hours of the earthquake. This was not
]mentioned in QST, so it is going to be disputed on this forum.
]
]Yours still waiting for the penny to drop.

Julian, I didn't get my info from QST, I got it by:
(1) going to Mexico City to operate 20 meters shortly after the quake
(2) observing that 2 WEEKS after the earthquake, the US embassy had
exactly TWO telephone lines working (via satellite). I used one
of these lines to call home, and it was not a normal line - you
picked it up and a special operator in the US answered. The calls
were free.
(3) traveling to the Mexican SCT (their equivalent of FCC + telephone
company + etc) and discussing the situation with them. They
had thousands of satellite circuits available immediately after
the quake, but THEY WEREN'T CONNECTED to anything useful, because
the 10 story building housing ALL of the long distance switching
equipment had fallen down. Yes, I saw the BT switch (there was
another flown in from Sweden), but believe me, it didn't come
close to solving the problem. I've got a 35 mm slide of what used to
be the downdown switching center. My host (an engineer for
Motorola) lost a bunch of friends who worked in that building.
(4) handling traffic for the Red Cross, Salvation Army and the
Centers for Disease Control 2 WEEKS after the quake. If the
high tech phone service was so good, why didn't they use the
phone?
(5) Frequently attempting long distance calls from Mexico City for
two weeks.

Nice try, Julian, but you got your facts wrong!

Yes, anything at all to do with semiconductors is expensive, because
you need ultra clean rooms, fine geometries, and dangerous chemicals.
(And I mean _real_ semiconductors, not cats whiskers :-)
But ... there`s a way.

MOSIS (1-213-822-1511) is the best bet for the small experimenter. $500 gets
you 4 packaged parts in cmos 2 micron technology,
132 pin pga max. They have a modem number; you give them yoiur design data
base in electronic form, and at their next scheduled run (they have
runs every 1-2 weeks.), they run your design through with many others,
and mail you the parts. Good for prototyping an idea

NICAD CELL CHARACTERISTICS

by

Hugh W6WTU

The operating characteristics of a Nicad cell are very basic in nature. During charge, only current and cell temperature are critical. Discharge may occur at any current rate until the cell terminal voltage falls below 1.1 volts, but the cell temperature rise must not cause the cell electrolyte to boil (gas). When connected in a pack, the pack must be unloaded when the individual cell voltage falls to 1.1 volts to prevent reverse charging of the lowest voltage cell in the pack.

Few applications discharge cells at an excessive high rate where gassing becomes a problem, with the exception of toy electric cars (These are toys for men). Cells designed for this application usually have larger than average plate area and large connecting tabs to support the higher peak current. Cell temperature is kept below the critical value by selecting the cell capacity such that the cell will dissipate its charge before gassing occurs. In essence, the toy car runs continuously with a nearly zero series load resistance allowing the cell temperature to rise near critical just as cell discharge is reached.

The following brief notes will further amplify an understanding of Nicad cell characteristics.

1. Nicads are very easily damaged due to gas pressure caused by over-charging at high charge rates. Unfortunately, Nicads do not have a positive indicator for indicating the state of charge. It is up to the user to estimate the relative charge state. Typically, the charge rate is calculated at C/10 where C equals cell capacity and the 10 represents hours for charging. At C/10, a nominal or normal charge would occur. A fast charge can be accomplished, cell design permitting, by changing the ratio, i.e., 5C/2.

2. Cell temperature does rise at the completion of the charge cycle, particularily at high charge current values, and can be used as a charge completion indicator. At the moment of temperature rise, the charge current must be reduced immediately to prevent excessive gas pressure build-up. Some chargers monitor the cell temperature and reduce the charge current to a small sustaining value. For 500ma cells, the sustaining value is typically between 10-25ma, or just enough current to compensate for the chemical change (internal current leakage).

3. Pulse charging of Nicads is most preferred as it is more efficient than a steady-state current value. Steady state current creates gas bubble formation on the plates of the cell, while pulse current tends to create fewer gas bubbles allowing the charge to be more uniform across the plate area. The charge uniformity is enabled by gas bubbles being moved around due to current pulsations. Bubble movement allows more plate area to be exposed during charge. Pulse charging also creates less of a temperature rise. The charge rate still has to be calculated as a function of C/10 during each charge pulse to determine total charge time (The accumulated charge is equal to the sum of the charge area under the pulse curve).

4. Older Nicad cells would not accept high charge rates above C/10 and would develop electrolyte seal leakage at attempted higher charge rates. A leaky seal, in any case, means the eventual loss of the cell. Newer cells, as used in most handheld radio applications seem to tolerate high charge rates without developing cell leakage as long as the temperature is controlled (kept low).

5. In the event corrosion around the seal of a cell develops, the corrosion can be removed. Wipe the corroded area with a vinegar soaked cotton swab. Use an ample amount of liquid and dry the cell with a tissue. Keeping the cell clean allows it to be used until it fails completely. Take note that weeping cells can cause corrosion problems if they are not inspected and cleaned regularly.

6. Discharge of a Nicad is critical only if the cell is under a load. When loaded, the cell voltage should not be allowed to drop below 1.1 volts which is just over the edge of the discharge end of the curve. Allowing the cell to drop to 1.0 volt or less while under load may cause permanent plate/electrolyte damage. The result would be a loss of cell capacity. Of course, a loss also takes place naturally with age which limits the number of charge-discharge cycles the cell is capable of supporting before it is exhausted.

7. Unloaded cells may be stored almost indefinately and allowed to discharge to whatever cell terminal voltage the cell can maintain on its own. When putting a previously stored cell into use, charge the cell, at least the first cycle, at C/10 for 12-14 hours. Shelf life of a cell is usually a function of how fast nickel whiskers develop internally that can short the cell. Two methods have been proposed as a way of extending cell life when whisker formation is of concern. a) Cycle the use of the cell/pack periodically. It is believed that the rate of whisker formation is reduced when cells are charged and discharged periodically. b) Allow the cell to sit on the shelf as long as needed and if a whisker short should occur, blast it away with a high current pulse from a capacitor or other source. It has been observed that once whisker growth/shorting begins, it can not be permanently stopped.

8. It has been observed that the terminal voltage across a charged Nicad cell will increase as the cell ages. Using this observation, the life expectancy of a cell can be evaluated and monitored. As an example, a new/fresh cell will exhibit a terminal voltage of 1.25 volts while an old cell will exhibit, say, 1.5 volts. It is believed that the cell dehydrates

with age and the rising voltage is a function of the increase in cell impedance.

9. Over the years, there has been many a discussion about Nicad cell memory. Yes, Nicads do have a memory function which can be aggravating if not understood. Simply stated, if the cell is used only over a small portion of its total capacity for at least 60% of the cycle time, the cell capacity will assume the more limited capacity value. To avoid the tendency of a memory condition inhibiting use, allow the cell/pack to be fully charged and discharged at least 60% of the total charge-discharge cycles. If in doubt about what is a full charge or what the discharge condition happens to be, then allow the cell/pack to fully discharge, unloaded when below 1.1 volts/cell, about one out of ten cycles. The charge rate from full discharge should be C/10 for 12-14 hours to cause as much chemical conversion to occur as possible. Charging at twice that value is not a problem as long as the cell doesn't start out-gassing (Monitor the temperature and taper off the end charge rate).

Many hints and kinks have been published regarding the nature and care of Nicads and all point to the fact that Nicads require user TLC to obtain long cell life. The bottom line is that the user must pay attention to how the cell is being treated.

>a 2 meter rig, and then stayed there forever. (That is not a dig on
>"techs", it is just an observation of what I have seen in a lot of cases.
>There **ARE** exceptions!)

Whoa there! You have misunderstood me. In our area there are darn few
hams on 220 who are not Novices. It has never been a popular band here
due to a Ch 11 tv station in town that is a simple image away from the
band. I know commercial equipment isn't bothered by this, but have you
seen a used Motorola or GE unit for this band at a hamfest? With the
current vogue for "wideband receive" in current amateur equipment this
is a disaster.

>Now wait a minute. Stop, cease and desist. Let's talk about "the old
>days when Novices had voice on 2 meters". I was one of them Gary, I was
>there.. I HAD that "privilege" (along with a simultaneous tech license.

>anywhere else my friend.. and I was only 20 miles out of Philadelphia in
>a place called Valley Forge. George Washington had better luck on 2 meters!

Well in rural Kentucky where I grew up, we had one of the first .34-.94
FM repeaters(1964). We used Motorola 5Vs and 40Ds for mobiles. My very first
ham radio project was converting a Motorola 5V from 6 volts to 12 volts
and downbanding it into two meters. Our repeater was on a 1000' TV tower
and had phenominal coverage. EVERY ham in our radio club bought one of
the Motos in a group buy. The repeater was busier than anything I've
heard around here in years.
>

>What you say was true when the Novice License expired after one year.
>Now it's good "forever". Novices ARE real hams. I like Novices more
>than just about any other class. They are USUALLY the most eager to
>learn and do not make any pretensions about knowing everything there is
>to know about ham radio.

Most are so eager that they upgrade in a few months and are gone forever
from the novice band. The others are the wives of hams who were pressured
into getting their licenses so they can talk to hubby. They are rarely
willing to talk to anyone else.

>If the test for Communicator Class requires one to study theory real hard
>and has an exam that looks for knowledge, instead of an ability to memorize
>answers then I say CW should be dropped like a hot rock.

I have always contended that it is easier to understand something than to
memorize it. At least this is true for me. And I don't understand the
need to test for a mode that is not commonly used on the frequencies
granted by the license.

Now before you all ask 'WHERE CAN I BUY?'... READ that mail header!

The Icom ICR1 is available in the UK for 399 pounds sterling; the
ICR100 is available for 499 pounds sterling. ICR100 is also available
modified to receive SSB (i always puzzled why Icom would wish to sell a
HF-bands receiver WITHOUT this as standard...)
Dont know what the current exchange rate is, i guess its about 1.85 dollars
per pound. Remember to subtract 15% from UK Sterling price to take into
account British Value Added Tax.

One thing that would help is to light up the tube for a bit with the
vacuum pump still running so any initial outgassing can get sucked
out.

I'm not sure what is in the getters.. maybe those could be homebrewed
as well?

Fine...but you couldn't have placed that call from where I was located last week. Thats what I was talking about. In simple terms....Cell Tel can't be used from every single location on earth.

The real point is that as of today Cell Tel has some functionality but it isn't the only answer, nor is it a complete answer to the problems faced during disaster situations. The same can be said of ham radio during these situations. All of the above systems are complementary to each other. You use what works.

What about alloy junction germanium transistors - they should be doable in non-cleanroom circumstances, shouldn't they? I'd imagine the materials wouldn't be too hard to obtain, and the geometries are large enough that real clean room conditions wouldn't be all that necessary. The yield might be somewhat low, and the device parameters scattered all over the place with home-lab conditions, but I'd think you could get some usable devices with a modest amount of effort.

Gee...who kept going for the first 24 hours? For that matter the
Red Cross brought in a satellite dish for INMARSAT(sp?) within
first couple days and had a similar system going... of course it
was brought in by N6IIU ;-) and there is also an interesting little
story about the Federales asking him at gun point what he was
doing. ;-) This same hardware was used during Hugo down in the
Carribean. These systems were COMPLEMENTARY to other systems
already in place. There were lots of independent efforts that
helped. Ham radio was one of them.

Just like in networking....it doesn't matter how the message
gets there as long as it gets there.

4633. Spread Spectrum Repeaters - Technical

Newsgroup: rec.ham-radio
Date: 1990-07-26 18:17:09 UTC
From: john@anasaz.UUCP
Message-ID: <2770@anasaz.UUCP>
Source record: 9789

We just had a thread here on spectrum efficiency where spread spectrum
came up as a solution. I would like to look into the technical aspects
of this a bit. I'm familiar with the theory of direct sequence
and frequency hop spread spectrum, but have never worked with it. I'm
also real hazy about practical synchronization techniques.
Finally, how does one build spread spectrum "repeaters" (ie, something that
provides roughly the functionality of current FM repeaters)? Phil Karn,
are you still listening? [I got your other answer, but wanted to get
more technical and ask more questions].

Problems (or, shall we say, opportunities?):
(1) Nearby in-band spread spectrum transmitters cause serious interference
to spread spectrum receivers by increasing the effective noise floor. Can
this be helped by doing some magic with frequency hop spread spectrum?
How does this work? Can it be done with DS spread spectrum by using
synchronized (ie, anti-correlated codes)?

(2) Spread spectrum systems will have to coexist (in many cases) with
other systems, either in amateur or other land mobile services.
How do you keep products from getting out of band. For example, let's
say I build a DS spread spectrum transmitter that operates on a center
frequency of 445.0 MHz, with a 9 Mbps DS rate. This should give sideband
nulls at 440.5 and 449.5 MHz. How do I keep the energy below 440.0
and above 450.0 from being a problem? Is this a reasonable example?

(3) Phil mentioned fast-switch half duplex "repeaters". How does one
limit the bandwidth on this (those fast on-offs will tend to give
a wide bandwidth). How about synchronization. Do you have any
specific ideas?

I realize that lots of these problems can be solved. One challenge is
solving them in a way that doesn't require the construction of a lot
of high-tech RF gear (digital stuff is okay - anyone can do that ;-)).
In other words, doing it in the standard ham tradition of hackin
surplus commerical gear. Also, solving them without EXPENSIVE
and complex filters. It's one thing to use a cavity or two and 2 meters,
its another to use 10 of them with very precise tuning required.

Let me also re-iterate Phil's plug for SS.

SS allows one to more effectively utilize crowded spectrum, UNDER
THE RIGHT conditions. It also affords relative privacy (ie, legally
you cannot use it for encryption, but you can sure use different
chip rates, etc). It is very good in any sort of selective fading condition
because it is not coherent, so fades only reduce the SNR a bit, rather
than a whole lot. It will reduce problems such as intermod, because

of its non-coherent/noise-like nature. It also allows the creation of
an almost infinite number of virtual channels (if the FCC will allow
a larger set of spreading codes), which can be really handy.

You aren't; you're following the footsteps of a long string of hobbyists.

From: cccph@eel.cs.ucla.edu (Charles Hobbs)
> Transistors, etc. would most likely be too difficult to make at home
> because of the necessity for "clean rooms" (rooms with no appreciable
> level of dust floating around. Dust will short-out a transistor,
> integrated circuit, etc.)
Nah, you're thinking of ICs, where the dust messes up the photomasking.
Remember, the first point-contact transistors were made by hand in the
lab.

A long time ago, I read a story about a person who built his own
vacuum tubes at home. The story was old then, and I don't remember
where I read it (probably Popular Electronics, back when it was
still in the smaller format), but I'll try to summarize.

(Disclaimer: I've never done this myself!)

Back when tubes were first being developed, most of the publicized
effort was going into the Edison/DeForest type of "tube" that was
based on the light *bulb* and required glassblowing skills. However,
there was a grassroots effort (primarily by Canadian experimentors,
I believe) that was based on using a metal *tube*. It is this second
type that is much easier to fabricate at home.

Take a piece of tubing (copper, I think) and find some hard-rubber
stoppers that fit it tightly, one with a hole, the other without.
The one with a hole is fitted with a glass tube that gets connected
to your vacuum pump.

The metal tube itself is your anode; you still need a filament and
a grid. Poke some fairly heavy-guage (#18) solid copper wires through
the stoppers (making their own holes): one in one stopper, and two in
the other. The filament (cannibalized from a light bulb?) gets
stretched down the center of the tube, strung between two of these
wires (crimped, not soldered!), and the grid is the third wire,
spiraling around that.

Remember that the filament is going to get pretty hot, so provide
a fairly-long thermal path before you get to the stopper, otherwise
you won't be able to maintain any sort of vaccuum. (The author of
the article said that he'd forgotten this, and when he powered
up his first tube, "... the vaccuum immediately left with a
piercing shriek.")

OK, put everything together and seal all joints with sealing wax.
("What's sealing wax?" :-). I'll try to do an ASCII picture:

The loops in the filament wires help keep them from getting too
hot where they go through the stoppers. Don't worry about all
that stuff having to do with "getters", etc. Most experimentors
just left the vaccuum pump running while they were operating
the tube.

At this point, pump out the air, apply power to the filament
(carefully!) and to the anode (see if you get a current flow).
Then experiment to see what kind of control you get with the grid.
I'm sure it'll take a lot of cut-and-try to get any significant
amount of gain, so have fun!

-- Dave Tweed

4638. PRO-34 Audio Mods?

Newsgroup: rec.ham-radio
Date: 1990-07-26 18:43:19 UTC
From: charlie@oakhill.UUCP

Cross-posted to: rec.ham-radio,rec.radio.shortwave

The PRO-34 is not a bad radio now that it's on sale, however, the audio is a little wimpy. Does anyone out there have the service manual showing the audio amp circuits? I would like to beef up the output if I can. I'll publish the 'audio mod' if it works well and is reliable. Perhaps someone has already done this. Yes/No?

-thanks,
Charlie Thompson WB4HVD

> How does this compare to tube amplifiers?

Ohm's Law still applies; if you're delivering 100W into a 50 ohm load, then:

P = V^2/R ---> PR = V^2 100 x 50 = 5000, sqrt(5000) = 70.7V

Assuming that you've measured the power correctly, this is RMS volts; the
peak voltage would therefore be 100V exactly.

SWR effects are interesting; if your 2:1 VSWR (Voltage Standing Wave Ratio)
is being produced by a mismatch at the load end of a line, that means that
about 11% of the power sent "down the line" is being reflected back to the
source. (To get this, note that SWR = (1 + R)/(1 - R) where "R" is the
reflection coefficient, and R = sqrt (Reflected Power/Forward Power))
If the source is matched to the line, this reflected power is dissipated in
the source impedance (and therefore simply goes into heating up the amplfier).
If the source is itself not matched to the line (and if both source and load
are mismatched, the SWR situation becomes more complex), as with a very low
output impedance source , the power will again be reflected out to the load.

A greater concern might be that "SWR" refers to the ratio of maximum to minimum
peak voltages on the line; it is possible, in extreme cases of high SWR and
marginal lines, to generate high enough voltages so as to cause cable breakdown
or at least "hot spots."

I don't think I understand your last question - how does WHAT compare to tube
amplifiers?

Subject: DXers! Own a chunk of Palmyra!

News Item from the 23 Jul 90 edition of the Honolulu _Star-Bulletin_ :

SAVIO PLANS DEVELOPMENT OF PALMYRA

"Honolulu real estate broker Peter Savio said today that he has taken out a 75 year lease on the remote and uninhabited Pacific island of Palmyra and formed a corporation, Palmyra Development Co., to get residential and tourist development underway.

"Savio said the agreement with the owners, Honolulu's Fullard Leo family, includes an option to buy the island for $36 million. He plans to do the 'get away from it all' residential development himself and recruit other developers for such facilities as a hotel, golf course, country club, and marina.

"Savio, head of Savio Realty Ltd., said his own plans call for the sale of 250 beachfront lots of 20,000 square feet or more, which he estimates will go for $250,000 each. That is about half what some observers have said such properties could be worth, he said. He also envisages 100 'estate-size' lots of 100 acres or so each." ((sic), I think - that's 10,000 acres. How big is Palmyra?)

Article goes on with details about Palmyra's location, climate, etc.

(So what say there, KH6R? Shall we go in 50/50 to buy a place and rent it to DXpeditioners? :-))

E-mail me direct if you'd like a snail mail copy of the article.

You're right, Phil. Anybody who questions this statement: try bringing up someone on 146.52, even during drive time. My first radio was a 2m HT, mostly because it seemed like the best "common ground" for a good percentage of the ham community.

I agree. The contention that 2m it too crowded to allow in the new
Communicator class is not valid in my opinion.

Here in the densly populated San Francisco Bay area I find that many 2m
repeaters are lightly or almost never used. Even during commute time
many machines are lightly used. I know of only one machine that gets almost
continous use during commute times. You could call this a zoo but this group
is friendly and welcomes newcomers or casual calls.

In my experience at any given time I find no more than 4 out of the
10 machines I listen to active. Many times the number is 1 or less.

More operators on 2m would improve the band! I don't believe we will be ble
to contend that we need all of our frequency allocations if our most crowded
UHF/VHF band usage pattern continues.

What we need are more hams not more bands.

|> Except for CB, aren't all the other services you list above 30mhz?

For the most part, yes. At one time, however, police radio was on HF because small, efficient and inexpensive VHF FM equipment didn't yet exist. Many other services (broadcasting, fixed, etc) still exist on HF yet many do not require their operators to know the Code. Nor are they required by ITU regulations.

|> I'm no expert on the ITU regulations, but my understanding is that the US
|> regulated CB (e.g. low power, antenna limitations, etc.) to keep
|> it a "local" service (i.e. range is typically limitted to 5 miles).

Yes. But this was an FCC decision. It had nothing to do with any ITU requirements.

> They [police, fire] are public services or business related concern, while
> CB is not at all public service or business related. I beleive it falls
> under the category of point-to-point personal radio, like the devices for

No, once again CB is in land mobile. The 49MHz stuff is Part 15.

|> Seriously, I too am curious why the Citizens Band exists and why it doesn't
|> violate ITU regulation. I know of other countries where CB radios are very
|> much ILLEGAL (without the appropriate lisence). (In the Philippines the
|> local village police used them for communication.)

Nothing in the ITU regulations prohibits an "administration" (a national government) from creating a CB-style service within its own borders. CB is illegal in certain other countries only because their governments have not created one.

Remember also that the countries making up the ITU are very jealous of their sovereignty, so there are lots of escape clauses that allow countries to do whatever they want inside their own borders.

>I am 21 years old, and I worked [CENSORED] hard for it !!! And I am
>getting fed up with people trying to make me feel GUILTY about earning
>my extra (for WHATEVER reason).

** I'm posting this not to criticize him, but because his comments
** brought to mind some other valid issues in the license class
** debate.

Believe me, so do I. I worked [CENSORED] hard for my Extra, too, and when I got it, I was so deliriously happy I could not speak properly for several hours! When I calmed down, I set my rig to that coveted "lower 25" of 20-meter CW, called CQ DE KD7MW/ST, and promptly got piled on by several hundred JAs who thought I was a DXpedition to Senegal!

But seriously, I think you are overreacting to people who themselves are overreacting--to the pompousness of some Extras who believe no one under Extra has any right to say anything about the future of ham radio. Several of them have posted messages to that effect in the past 2 weeks.

>**BUT** the solution to **ALL** of this clamoring is **NOT** to lower
>the standards of the licensing structure -- this is the kind of live-
>for-today mentality that has brought many of this country's problems
>upon itself

Whether or not there should be an Extra or Advanced license with exclusive HF privileges is not the issue here. Nor is there a question of lowering technical standards. Communicators will have to pass the same (or harder) test that Technicians do, to get the same VHF+ privileges (or less if they're limited to 220 and up).

Also, I think you may be missing a little historical perspective here. The US has one of the most complex license structures in the Western world. It didn't used to be that way, and it happened by taking privileges away from people who had earned them. Pre-1967, there was no Advanced licence, just a "Class A" that had been grandfathered for

years. Technicians had all VHF but no HF. Novices had no 10 meter voice, but did have voice on 2 meters. Extra was an ego-booster with no extra privileges. Generals had all amateur privileges.

Suddenly, the Extra/Advanced bands were carved out and taken away from Generals, with the instigation and full support of the ARRL. Novices lost all voice privileges.

Many of us back then felt rather betrayed. I was a 15 year old prospective Novice in late '68 and an Advanced by spring '69. I remember how I felt: that a bunch of cynical old men in the ARRL (many of whom had been trained to do 20+ wpm code by the military in WWII) had decided "I'm all right, Jack, screw you all" and deliberately upped the requirements for new people like me, keeping the choicest piece of the pie for themselves. Can you imagine how the Generals felt?

There have been some corrections to the "incentives." Somebody finally realized that an all-code license was not a terribly big draw to young people, and the FCC gave Novices 10 meter voice. They gave Techs Novice HF privileges, so the Tech license wouldn't be an automatic dead end. There was a lot of talk about "lowering standards" over those decisions, too.

The long-term effect of incentive licensing was largely negative. Those who had the time and inclination/ability to upgrade did so, and others did not. The number of new hams declined. So did ARRL membership, which may have seriously weakened ham radio's national society, and hence its voice and lobbying power. Also, I believe the perception of injustice caused by incentive licensing was a factor in the decline of respect for FCC rules in general, and amateur radio's traditional politeness in particular. Certainly society's changes during this period were more important, but I think incentive licensing had more to do with it than people realize.

There is no evidence that people who upgraded are any better operators or any more technically adept than those who didn't. I suspect that most memorized the material and promptly forgot it, and most people who got Extras were DXers and contesters. But those who did not upgrade were to some degree branded and disenfranchised, especially when the call sign groups evolved and left lower-class licenses as identifiable as those with non-white skin color in society at large.

You can't be absolutely sure of license class, since some Extras (like me) prefer to keep an Advanced or General call sign. But if W7XX or NZ6Y get into a tiff with KB7ABC, the difference in call sign is fairly likely to be used as a weapon. Can you blame KB7ABC if he gets tired of this treatment and develops a hostile attitude toward Extras?

Most of the Ham theory tests are within reach of non-professionals in radio/computers, and that's as it should be. As I said in my previous post:

PK The ham exams were never intended to prove *professional* competence in
PK> state-of-the-art radio and computer design. They were designed to
PK> ensure that the applicant had gone to the trouble of attaining some
PK> reasonable level of knowledge in radio and related matters, so he/she
PK> would have the basis to become competent in whatever aspect of hamming
PK> he/she chose.

The exams tend to test a lot of surface knowledge, not in-depth stuff
(with the possible exception of Advanced, which I found hard as a kid).
Code is another matter. It may take more spare time than a lot of
people have. Especially these days, and in technical fields. It seems
like nobody will hire you unless you're willing to work 55-60 hour
weeks under normal circumstances, more during crises.

But nobody's going to work much real CW DX unless they can do code
faster than the Extra requirements in most cases. Nobody can do
advanced packet work or TCP/IP networking unless they know the protocol
and the basis for it in much greater detail than anything in the exams.
Why should a computer-oriented VHFer spend time learning Morse that he
could be spending with error-checking algorithms, programming, and
digital signal processing? Wanting and preparing to actually do
something is a far more effective incentive than yet another test.
And I believe, it leads to better learning.

Case in point: I was a theatre/music major in college. I took 2
semesters of theatre history courses which required us to memorize the
important points, plots and characters of most of the great plays of
Western Civilization. I got a perfect score on both final exams. Do I
remember anything about most of those plays? No. The plays I remember
are the ones I worked on, acted in, or wrote music for.

>...and if you're one of these people with the mouths,
>maybe you should think about what you want out of ham radio within
>the constraints of the current system, and leave the changes to the
>less emotionally driven.

Whoa, I think you're being a little emotionally driven here yourself.
Which is perfectly valid. It's just that your emotions are driving you
to guard what you have rightfully earned, under the present system.
And that system was created by taking away what every General
class ham in the country had "rightfully earned" before 1967. People
who see themselves as hampered by the current system are also
complaining emotionally. And we all look for rational justifications
to support our emotionally driven opinions.

Bottom line is that the Communicator license is not going to take any
of your (or my) quieter Extra class HF bands away. It is simply going
to allow a group that has been kept out of ham radio in, and allow them
an appropriate place--VHF and up. Sure, there will be some dead wood
let in, but I don't think it will be in any greater proportion than we
already have. I suspect that we will gain some new blood that has been
sorely lacking because of the code *ENTRANCE* requirement.

Those that want to get on HF will have to upgrade. And learn the
code. Just like the rest of us.

> (1) Nearby in-band spread spectrum transmitters cause serious interference
> to spread spectrum receivers by increasing the effective noise
floor. Can
> this be helped by doing some magic with frequency hop spread spectrum?
> How does this work? Can it be done with DS spread spectrum by using
> synchronized (ie, anti-correlated codes)?

Yes, frequency hopping has less of a near-far problem than direct sequence. QRM still occurs (when two transmitters happen to land on the same channel momentarily) but the effects can be reduced through the use of forward error correcting codes optimized for correcting burst errors. In direct sequence systems (particularly ones where you don't know the spreading sequences of the interfering stations) the QRM looks just like white noise and you have to treat it in the same way.

Synchronized codes might in theory help reduce QRM, but since the main advantage of the civilian use of spread spectrum is to avoid the need for prior coordination (of frequency channels or anything else), I don't think this is too practical.

> (2) Spread spectrum systems will have to coexist (in many cases) with
> other systems, either in amateur or other land mobile services.
> How do you keep products from getting out of band.

Just use filters. Wideband filters with sharp skirts do exist; TV broadcast exciters are an existence proof. SAW filters in TV receivers are another example.

> (3) Phil mentioned fast-switch half duplex "repeaters". How does one
> limit the bandwidth on this (those fast on-offs will tend to give
> a wide bandwidth). How about synchronization. Do you have any
> specific ideas?

Well, "fast" is relative. The repeater would switch rapidly in terms of a data packet time, but this could still be very slow in terms of a chip interval. So the turn-on transient would be much narrower than the total spreading bandwidth.

WRT synchronization, THIS is by far the hardest part of any practical spread spectrum system. Several standard approaches exist, including the code-tracking loop (the spread spectrum analog to the Costas loop for PSK). Entire books have been written on the subject. Some amateur experiments have used common external references, such as broadcast station carriers.

> the 220 band and admit I am opinionated about it.

Let's put Novices *BACK* on 2 meters.

But really I agree with you that 220 Mhz is a better band. But how do you
get most of the present hams onto 220? Where do I find a TRI-band HT?
I have several radios, including an IC-3AT, but I'd like to find a way
to get on all the bands in one radio, especially with an HT.

Of course we could make 440 the "watering hole", but without novices.
There is 1.2 Ghz.

> Let's say that the current proposal goes through and Communicators get
> "stuck" on 220. Are you going to push to get a repeater going on that
> band? We did here for Novices, and we also put links on it to 2 meters

Probably. We did not do this for Novices in our area because we determined
that the numbers would be too few. But I expect Communicators restricted to
220 Mhz and up would be more populous, but I'd more likely expect to see a
440 Mhz repeater show up just because someone already has one sitting in his
garage.

> so that we had the OPTION to hook into it and talk to them, just like we

Right. But rural areas don't have the density demand. If we lost 220 and
902 Mhz, it would no big loss to us; it would be a psychological loss only.
We have PLENTY of room on 2 meters to increase the ham population TEN FOLD
and I suspect big cities can handle QUADRUPLING.

>ham fests and other gatherings I go to.

I've noticed this too. I recently went to a meeting of the local
ham radio club and noticed that there weren't any teenagers there.
When I was first licensed in the late 60's we had a club that was
almost all teenagers. Plus, there were always bunches of teenagers
hanging out on 40 and 80 making a general nuisance of themselves.
I don't hear this anymore.

I'm sure a 12 or 27 year old could have fun in ham radio but
there will be fewer of you than 15 years ago.

Anything you read here is my opinion and in no way represents Sybase, Inc.

This was the first I had heard about this but your positive comments
about Bill make sense. I went to school with him at UC Santa Barbara
where he had come to get a Master's degree in EE. As I recall, he
already had a MS in Chemical Engineering. He was in the UCSB ham
radio club W6RFU and was always one of the most technical people.
He was also very active in the technical projects of the local
ham club. He moved up to Berkeley for a while and lived at the
top of the Berkeley hills in a house with all kinds of ATV stuff.
He used to do all kinds of wierd ATV stuff and always had a very
independent approach to ham radio. I had lost track of him and
was surprised to hear about his editorship. He's certainlly
technically qualified.

Anything you read here is my opinion and in no way represents Sybase, Inc.

> to spread spectrum receivers by increasing the effective noise floor. Can
> this be helped by doing some magic with frequency hop spread spectrum?
> How does this work? Can it be done with DS spread spectrum by using
> synchronized (ie, anti-correlated codes)?

A spread spectrum repeater will interfere with itself just as much if the
transmit band overlaps the receive band. The adjacent machine would only
increase that by 3db more.

However if the transmit band and receive band are far enough apart in
frequency, and the two repeaters do it the same way, they can simply
filter out the transmit frequency range from the receiver.

> (2) Spread spectrum systems will have to coexist (in many cases) with
> other systems, either in amateur or other land mobile services.
> How do you keep products from getting out of band. For example, let's
> say I build a DS spread spectrum transmitter that operates on a center
> frequency of 445.0 MHz, with a 9 Mbps DS rate. This should give sideband
> nulls at 440.5 and 449.5 MHz. How do I keep the energy below 440.0
> and above 450.0 from being a problem? Is this a reasonable example?

Use bandpass filters in the sinusoidal domain. Perhaps that rate is too
high for that part of the band. I also tend to think that SS should ALSO
be combined with NON-spreading scrambling to even out the spectral density
so there are no major peaks or nulls. Simple DS methods don't achieve the
best form of spreading by themselves.

> (3) Phil mentioned fast-switch half duplex "repeaters". How does one
> limit the bandwidth on this (those fast on-offs will tend to give
> a wide bandwidth). How about synchronization. Do you have any
> specific ideas?

I don't recall what Phil Karn mentioned, but it sounds somewhat like a
packet swicthing system to me. Maybe not.

> Let me also re-iterate Phil's plug for SS.

> SS allows one to more effectively utilize crowded spectrum, UNDER
^^^^^^^
"Share" might be a better word here. SS allows you to NOT tie up a
frequency assignment. Consider the case of a parking lot with 100 spaces.
If you assign a space to everyone, only 100 people can get spaces. But
if you issue 800 "park anywhere in the lot" stickers, then 800 people can
share the lot as long as not more than 100 people try to park at the same
time. But ANY COMBINATION of the first 100 people can concurrently use the
lot. As the lot fills up, one has to hunt for the free space (high SNR).

This is why hotels defer your room assignment until you arrive.

> THE RIGHT conditions. It also affords relative privacy (ie, legally
> you cannot use it for encryption, but you can sure use different
> chip rates, etc). It is very good in any sort of selective fading condition
> because it is not coherent, so fades only reduce the SNR a bit, rather
> than a whole lot. It will reduce problems such as intermod, because
> of its non-coherent/noise-like nature. It also allows the creation of
> an almost infinite number of virtual channels (if the FCC will allow
> a larger set of spreading codes), which can be really handy.

We can experiment with the single codes we are allowed to use now, and
get some number of virtual channels. But ultimately it would be nice to
be able to choose any code.

While problems like intermod will be reduced in there effect, this also
does have the drawback that the problems can get severe, and begin to
impact things with a very high noise floor. Other than those that stay
minor, problem do still need to eventually be tracked down and corrected.
SS could make that much hard to do. DF-ing a signal you cannot receive is
very hard to do. Calculating intermod products is meaningless if everyone
is using the same, or very broad, frequency spreads.

SS has it advantages and its disadvantages. I personally believe the
advantages outweigh the disadvantages in MOST cases (once the technology
is in place). But one needs to learn to deal with SS as well. The problem
with 2 adjacent repeaters might be curable much easier than two adjacent
neighbors trying to work SS DX.

This isn't quite true. I live a few miles (<10) from the epicenter,
and my phone NEVER failed. Dial tone was a little slow to get, but
I wasn't going anywhere for a while.

In fact, after I found the cat and flashlights, I picked up the phone
at 5:37 and telephoned my Dad in Santa Barbara. He was watching the
broadcast on TV about the Oakland Bay bridge. It was from him that
I got the first accurate report of the extensiveness of the bridge
collapse. He could see it on TV!

> Nothing is more destructive to a NiCad battery than continually doing
> partial recharge cycles.

This *appears* to be destructive because it reduces the charge capacity -- temporarily. Also, it means you are more likely to overcharge (generating heat) because you don't know how long to charge (unless you have a smart charger that senses temperature and/or the voltage DROP that occurs after full charge is attained).

Partial charging is not actually destructive so long as you don't overcharge or overdischarge as a result. What happens is the cells in the pack get out of sync. The whole pack appears "discharged" when the first cell (out of 4 or 6 or 8 or more) runs out of stored charge -- and it begins to reverse charge if you continue to drain the other cells. Of course you won't be able to do that easily because the radio will sense the too-low voltage, as soon as one cell is empty, and shut off.

Moral: Partial charge when you must, using your judgement about how long to do it and how much it will extend the useful life of the battery in field conditions. However, as a normal rule, use a pack until exhausted, then fully charge it (by timing if you don't have a smarter charger). Slight overcharging is good, as long as you don't overheat the battery, because it brings all the cells up to full potential. Likewise, occasional discharging "to zero" is good for the same reason.

> The thermistor senses the rapid temperature rise that a fully charged
> pack exhibits when continued charging is attempted.

Watch out for cycling a fully-charged battery in and out of overcharging though, as it cools down and heats up again.

4656. Satellite Interference Location System (Re: "Captain Midnight")

Blurb from Seattle Times, 23 Jul 90, F2:

Tracking Midnight

Captain Midnight, look out. Using radio navigation techniques, engineers at Georgia Institute of Technology have developed a system to pinpoint the location of ground stations that interfere with satellite transmissions.
Called the Satellite Interference Location System, the new technique should help satellite operators quickly locate sources of accidental satellite interference -- including Captain Midnight, who four years ago beamed a protest message into an HBO transmission.
The system uses navigational and mathematical techniques to determine the longitude and latitude of the ground station.

Me again. I'm spouting off a lot about NiCads and figured I should name my source. It's N0JCO, a friend who's done a lot of studying on the subject. I've read Sanyo and GE NiCad application guides I borrowed from him -- it's fascinating stuff.

Another NiCad tidbit. Apparently one common failure mode is for metal needles to grow through the electrolyte, shorting the electrodes. If you have a "dead pack", that won't hold any charge, and you're going to trash it anyway, try a last ditch maneuver. Run about 30A through it very briefly (about a second?), taking care lest the seals open on the cells and spout hydrogen, oxygen, boiling electrolyte, etc. :-)

This is reputed to "burn off" the needles and thereby bring old cells back to life in some cases.

Also you can sometimes open a pack, identify one or two bad cells, and just replace those. I haven't had need to do it myself, and it sounds like work.

> ...*WHY* do we want *MORE* hams?

Another reason: More people to talk with. If I was the only ham in the world it would be no fun. If everyone was a ham it would be very crowded, but other human systems are already crowded and we find ways to cope. There'd be more chance of finding a late night drive-time QSO, of getting emergency help, etc. It would be easier to manage caravans. And the occasional emergency would have fewer communications limiters.

<<...and if you're one of these people with the mouths,
maybe you should think about what you want out of ham radio within
the constraints of the current system>>

The problem with the current system is the market...we havn't "sold" our
hobby to our neighbors as something valuable, so the powers that allocate
radio spectrum will start to take it from us if we don't start to get lots
of new hams soon..and you and I will have no "ham Radio" in our "old fart"
years....code is NOT the issue...what we need is a way to give people a
"taste" of our hobby/service, and the communicator proposal will do that.
I don't think that the communicator class will become a technician class
type ticket...there are many good hams who are content to stay as techs and not
upgrade...the communicators ticket is designed to be "upgraded from", and
if marketed properly, will lead to a rejuvinating of our hobby/service...
Basically, we are being given a challenge by the FCC...grow or be
gone......and unless our great hobby pulls together and we ALL do something
about getting new hams (regardless of interest) by the end of the 90's our
hobby will be vastly different, if it exists at all....Barry

> communication systems were down. Telephones (including cellulars) did not
> work until about 9pm. (The quake happened at 5:04)

I can offer another counterexample. I was driving home from a computer show in NJ when the Loma Prieta earthquake occurred, and by the time I got home (< 30 minutes later) Patty, N6BIS, had already left a message on my answering machine saying that everything was all right.

No communications system, amateur radio or landline, can possibly satisfy everyone when demand exceeds supply. Some users have to lose. That should be obvious. But the telephone companies spend a lot of effort building in mechanisms to keep their systems from collapsing under overload. By this I mean that even under pathological overdemand, the system will continue to operate at or near full capacity; it will not waste lots of resources in failed call attempts.

Within minutes after the earthquake, the long haul carriers began blocking inbound telephone calls at points well outside the earthquake area. This kept the trunks into the Bay area from being wasted on failed call attempts, allowing the people in the affected area (such as Patty) to make outbound calls with almost no difficulty. Because there was no damage to the system itself, these mechanisms worked flawlessly.

Amateur radio is often a different story. Everyone knows from listening to a DX pileup or an overloaded packet radio channel what happens when everybody transmits at once: NOBODY gets through, and the channel is effectively wasted. Contention is inherently more difficult to deal with efficiently on a multiple access radio channel than on a network of point-to-point links, because you can use queueing on the latter to avoid collisions. Furthermore, current amateur operating practices come nowhere near the theoretical maximum throughputs possible, either because the computer software executing the correct "access algorithms" does not exist (for packet) or because (for manual voice) the human operator lacks training, has poor discipline (e.g., emotional stress) or simply because he's human and not a computer. And it only takes one to screw it up for everybody else on the channel.

Channel access and congestion control algorithms are strong interests of mine, as they have applicability both to amateur radio and my research work for Bellcore. I think there are some real opportunities to try out some of these schemes in the amateur service and perhaps make some significant practical contributions to the field. As I've said before, if we can make it work in amateur radio, it will work ANYWHERE...

Sb: Alkaline battery hazards

Reportedly some alkaline batteries are now being manufactured with the case connected to the outer shell of the cell. The printed coatings act as an insulator, at least until it wears through due to friction with the battery holder.

Check your alkaline batteries before using them in metal flashlights or metal battery holders.

In HT's, be sure that the negative spring terminal does not extend to the outer case where it will eventually rub through and short out.

Additionally, remember not to mix battery types such as alkaline, carbon-zinc, or NiCads. NiCads in particular can supply high amounts of current through a series discharged cell, causing damage or explosion.

>A spread spectrum repeater will interfere with itself just as much if the
>transmit band overlaps the receive band. The adjacent machine would only
>increase that by 3db more.

Remember that the difference in transmit and receive signal levels at a typical VHF/UHF repeater (i.e., the repeater's power gain) can be 150 dB or more. Spread spectrum processing gains, however, are seldom greater than 30 dB (for a 1000:1 spreading ratio) and this is all the selectivity you get between the desired signal and a stronger, interfering signal sharing the same spreading band. In other words, a simultaneous spread spectrum repeater using the same band for input and output is simply not very practical.

If you really want a simultaneous repeater for spread spectrum signals, build a wideband crossband translator. Otherwise, build a single frequency packet switch that need not transmit and receive simultaneously.

>Use bandpass filters in the sinusoidal domain.

What does this mean?

>I also tend to think that SS should ALSO
>be combined with NON-spreading scrambling to even out the spectral density
>so there are no major peaks or nulls. Simple DS methods don't achieve the
>best form of spreading by themselves.

On the contrary. ANY decent spreading method will produce a signal that is statistically indistinguishable from broadband (though still band-limited) noise. Even linear feedback shift registers (PN generators) of the type allowed for amateur operation will suffice, and these happen to be the very same type of circuits used for modem scramblers. (Indeed, a modem scrambler is really just a spread spectrum modulator with a 1:1 spreading ratio.) Therefore no additional steps are needed to eliminate spectral lines (other than picking a long enough shift register).

>I don't recall what Phil Karn mentioned, but it sounds somewhat like a
>packet swicthing system to me. Maybe not.

No, that's exactly what it is. A direct sequence spread spectrum system is inherently digital, so why not use it as a modem on a packet switch. If you want voice, digitize it.

Sb: ONE-LAND WOODPECKER

ONE-LAND WOODPECKER

Those of us who chase DX as a passion have all shared this experience. We've got our beam pointed just so, and our finals are peaked and tweaked to output as much RF as is legal. We've listened and we've figured out the DX station's operating pattern. We're just about to key our transmitter, victory and conquest certain, when we see our S-Meter start to jump. We reach for the noise blanker, but the pulsing is just too much for our rig. The Russian woodpecker has just snatched away our victory.

The Russian woodpecker is a over-the-horizon (OTH) radar system that operates in the HF bands. It has been recently joined by an American version, also operating in the HF bands.

With transmitting antennae located in Moscow, Maine (it's too ironic not to be true) and receiving antennae located over 100 miles away in Columbia Falls, Maine, this OTH system will guard our east coast. The area of coverage extends from Greenland to Cuba. The operations center is located in Bangor, ME. From here, display signals indicate aircraft targets, automatically correlating them with all known flight plans. Aircraft not correlatingare reported to NORAD (North American Air Defense Command).

Each of the three transmit antenna arrays is 3630 feet long and 35 to 135 feet high. Each transmit array is divided into six sub-arrays to handle frequencies from 5 to 28 MHz. Frequency switching is controlled by 28 individual VAX computers which input atmospheric conditions and determine the optimum operating frequency. The range of this radar system is between 500 to 1800 miles, as compared to 200-300 miles for conventional systems.

The coverage area is divided into three 60 degree segments. Each segment is served by 12 100 kW transmitters (talk about a pile-up buster). The receiving antenna array is 4980 feet lone and consists of 246 monopole elements.

Lest you take comfort in the thought that this system is far away. The Maine system is only the first of 4 similar systems to be built. A west coast system is about 90 percent complete and has already been operationally tested. Transmitters are located near Christmas Valley

in Southern Oregon and the receiving antennas are located near Tulelake, California. This system will provide coverage from Alaska to Baja, CA. The third system, with transmitters looking north from Alaska, is expected to be begun later this year. Finally, a system, covering the central U.S., looking south to cover the Caribbean area, is expected to be awarded in early 1991. This last system is expected to be paid for by funds allocated to the military for the war on drugs and will be used to spot smugglers, as well as possible enemy aircraft.

Japan and Australia have also shown interest in installing OTH systems in their countries. This brings up the possibility of a new award. HAW, Heard all Woodpeckers. If it's been a while since you've heard the Russian Woodpecker, don't fret. His cousins are just around the corner.

>>small strong one :=) ...
>You could do this successfully if you had some way of getting a
>good vacuum. (Commercial valves have chemical compounds known as
"getters" which aid in removing oxygen from the valve)

Before I run off about getters, I'd like to mention that light bulb
filaments have low emmissivity, and probally aren't suitable, and that
a test tube, or olive jar would probally be a lot easier to evacuate.
Also, using direct filament emmision means you'll need DC filament
supplies to avoid hum.

I quote from Physics of Electron Tubes, L. Koller, McGraw-Hill, 1937 (2e)
No matter how well a vacuum tube has been exhausted, there always remains a
small residual pressure of gas. This may perhaps be of the order of
0.0001mm of Mercury in commercial tubes. Even at this low pressure,
the number of molecules of air per cubic centimeter reaches the
astounding figure of 10^12.
...

The getters most commonly used at present are phosphorus, calcium,
magnesium, barium, strontium, aluminum and various mixtures of alloys of
these. Phosphorus is used in the red form.
...
Barium and strontium are very active getters but have the disadvantage of
oxidizing rapidly... For this reason the are often used in the form of
alloys with aluminum, which are quite stable in air and from which the
active metal can be vaporized by heating, after exhausting the tube.

... [Discussion of reduction of gas pressure during getter vaporization
by collision between getter and gas molecles, and later, after getter has
volatized onto surface of tube wall by formation of monatomic layer of
gas molecules, mentioning 10^2 cm layer could reduce pressure 3x10-3 mm Hg
in 100 cc bulb.] I believe getters were vaporized by strong RF field,
which also contributed to the vacuum by accellerating gas ions into the
tube walls.

Glass and electrode metals substantially outgas and must be heated for a
considerable time to reduce this effect.

Getters were actually invented by John T Marshall (1908) to exhaust tungsten filament lamps, and many others patented improved getters in the next few decades.

All in all, soft tubes like Brian's grandaddy used to make would be a whole lot easier. Reasonable detectors, lousy amplifiers. Still could awfully interesting. Others have done tubes at home, and I've thought about it a lot. Anyone seen documents on Sprengel vacuum pumps as used by Edison?

Send mail, join the languishing Antique Radio mailing list.

SB ALL @ AMSAT $ANS-203.01
DO-17 RETURNS TO SERVICE!

HR AMSAT NEWS SERVICE BULLETIN 203.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 22, 1990
TO ALL RADIO AMATEURS BT

DOVE-OSCAR-17 RETURNS TO SERVICE!

After a four month sojourn in a computer coma, DOVE-OSCAR-17 returned to service on July 22nd at 02:41 UTC when N4HY commanded its 2M transmitter on. As it passed over the horizon at his QTH, he knew immediately that the tedious and time consumming "auditory" software loading process had been successful and that this time the on-board computer (OBC) would not crash. Later, ZS6HKV heard DOVE's 2M beacon on 145.825 MHz at 06:50 and again at 08:26 UTC over South Africa. ZS6AKV and stations in Zimbabwe heard DOVE sending ASCII telemetry for 2.5 minutes and then stop for half a minute, and then repeat this cycle again and again. At the present time DOVE's RF output power is about 250 mW and will stay at that level until the battery bus voltage reaches 11 volts. Once the batteries charge up to 11 volts, the battery charging algorithm in the OBC will take over and increase the RF output to 1.5 watts. N4HY feels this will happen soon now that DOVE battery charging is back under software control. For the first few days it may be difficult for those with a simple station, i.e., non-tracking antennas, to hear DOVE's 250 mW. Stations with tracking antennas and low-noise preamps will not have any trouble receiving the ASCII telemtry. All are urged to monitor the telemetry during this critical period.

After careful analysis, N4HY has concluded that the problem which made the software reload of DOVE so difficult was caused by an anomaly in the AART (Addressabe Aysnchronous Receiver/Transmitter) board. The AART provides a bus which connects all the various modules of a MICROSAT to the On Board Computer (OBC) and allows them to be controlled individually by the OBC. For reasons not yet clear to N4HY, the AART was not responding to the S-band transmitter, telling it that the OBC had correctly received an Acknowledge packet when software was being loaded using the 2 meter uplink command receiver. Therefore, when N4HY was listening for Acks on his S-band down converter while uplinking, software was being loaded properly but the S-band was not sending the Acks as it was suppose too. The OBC was commanding that the Acks be sent, but the S-band transmitter wasn't "hearing" the command coming out of the OBC. N4HY says he now has an understanding of the problem and he and NK6K will be able to tailor their software to work around this problem. Further, "it is not a dangerous problem and the DOVE module is accepting commands" according to N4HY.

AMSAT-NA wishes to acknowledge the heroic efforts of N4HY and NK6K as they worked through the solution of this time consuming problem. Though this would have been a difficult problem to have solved on a test bench in the MICROSAT Lab, it was an even more difficult problem to work with DOVE several hundred miles in space. This shows once again the ingenuity and innovativeness of the AMSAT-NA MICROSAT Team to solve problems.

PAKISTANI SATELLITE LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 203.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 22, 1990
TO ALL RADIO AMATEURS BT

BADR-1, the first Pakistani 'amateur' satellite was launched successfully yesterday on 16 July 90 according to SUPARCO (Space & Upper Atmosphere Research Commission - Pakistan). BADR-1 is believed to be a small UoSAT-11/FO-12 class satellite. A Chinese Long March booster was used to place the payload into a low inclination, elliptical Earth orbit.

Amateurs around the world have been hearing BADR-1 transmissions on 145.825 MHz FM. They are comparable in strength and polarization to UoSAT-11. Data modulation or modulation tones have been heard on the FM carrier but data has yet to be interpreted by ANS sources.

Keplerian elements for BADR-1 are carried in this week's AMSAT - ORBS release. Refer to bulletin $ORBS-202.M titled "Orbital Elements 202.MISC."

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 203.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC Time Phs Mode NCS U.S. Day

27 Jul 90 0030 130 B N5BF Thursday
07 Aug 90 0130 170 J/L N5BF Monday
18 Aug 90 0045 170 J/L N5BF Friday
28 Aug 90 0100 169 J/L N5BF Monday

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your nearby AMSAT Regional Coordinator

SB ALL @ AMSAT $ANS-203.04
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 203.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 22, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190
Mode-LS : MA 190 to MA 195 (Mode S Beacon only)
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 240
Off : MA 240 to MA 003
Omni Antennas : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:

BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

Despite its popularity, bare aluminum is actually not a very good heatsink material, especially when polished. Although it is a reasonably good conductor of heat, it does not radiate very efficiently. Painting it with almost anything (even white paint) improves the thermal emissivity substantially. The best you can do is to black-anodize it.

Several materials are better thermal conductors than aluminum, including (in decreasing order) silver, copper, gold and beryllium oxide. In fact, the best thermal conductor listed in my reference text, better even than silver, is a non metal, an electrical insulator, optically transparent and mechanically quite rugged. Unfortunately cost is a problem. It's diamond.

A guy I shared a house with when I was at college made an X-ray tube in the University glass-blowing shop (Andy Bell, where are you now?). We wouldn't let him run it in the house!!! But it worked fine. A triode shouldn't be much more difficult. Your real problems are (i) glass to metal seals (use "invar" wire) and (ii) evacuating & sealing it.

Have fun,

Hugh Davies, G0CNR

Actually the Radio Shack trap works reasonably well. It may be worth
setting it up so that you can switch it out, though. Remember, that trap is
designed to work with wanted signals from 54 to 800 mhz.

Subject: FM Trap for R7000
Message-ID: <9007270833.aa14403@FSAC1.PICA.ARMY.MIL>

I read your message on info-hams about your FM problem in Mini.

I designed a suckout trap for you on my computer this morning after
finishing the bagel... I didnot build it because at this present job
I don't have a lab handy, but it should work fairly well, maybe i'll
build it at home (I have lot's of equipment there). I will describe the
filter to you because I am crummy at drawing schematics using keyboard symbols
so here goes.. The filter is a symmetrical tee configuration.

The first series leg is a .080 microhenry coil in parallel with a 32
picofarad cap. The other end connects with a series connected .080
microhenry coil which is in series with a 32 picofarad cap to ground.
the right leg of the tee is the same as the left. That is 32 pf cap and
.080 uh coil in parallel. Connect in series with your antenna.. The
computer program said it should have less than 1 db. loss at 146 MHz
and more than 50 db. loss over the whole FM band. If you have questions
give a call or e-mail or carrier piegon or smoke signals.

4671. Stripline inductors

Newsgroup: rec.ham-radio
Date: 1990-07-27 14:10:38 UTC
From: mleech@bcarh342.bnr.ca
Message-ID: <1990Jul27.141038.26662@bnrgate.bnr.ca>
Source record: 9827

In all the treatments of stripline design that I've read (including the "classic" Stripline Circuit Design, by Harlan Howe)--all the design equations assume a three-layer structure like this: (where ===== represents a stripline inductor).

```
-----------Upper-Ground-Plane----------------
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
\\\\\\\\\\\\\\\\\=====\\\\\\\\\\\\\\\\\\\\\\\\\
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
-----------Lower-Ground-Plane----------------
```

in this scenario, the stripline inductor is surrounded by a dielectric material of constant Er.

In "real life", one is much more likely to see a structure like this:

```
.air.....................................
.............air............air...........
.........................................
.....air.........=====.....air............
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
-----------------Lower-Ground-Plane----------
```

without an upper ground plane (or at least one that is far enough away relative to the lower one to be irrelevant).

Can someone point me to some literature that deals with the "real-life" situation of a mixed environment.

4672. More hams or Less - a view from across the Pond.

Newsgroup: rec.ham-radio
Date: 1990-07-27 14:13:02 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <27.Jul.90.15
Source record: 9828

More hams or less; Well personally i am opposed to the 'more at almost any costs' approach. Here in the UK there is a forthcoming 'Novice licence' (3 watts on certain VHF bands without code, same power in certain HF bands with a 5WPM code test. No age limitations or anything).
IMHO this is a retrograde step; what can you do with 3 watts on the HF bands when the guy down the road has 1Kw to a TH6DXX?
I must admit total opposition to this idea. IMHO what we need are more innovators from the 'professional' side of electronics. Has anyone thought of a ham-bands version of cellular? Who is using spread spectrum and/or digital speech-compression (like in CT2 phones)? Has anyone applied high-temperature superconducting elements to ham radio?
I do not believe that a 3-watts licence will introduce the sort of talent required to maintain (let alone develop) the true spirit of ham radio over the next ten years. Equally, I have no reason to suppose that the mandatory-code-test, head-in-the-sand ostriches have any real contribution to make. Why should a person have to pretend he is a modem in order to prove he is a 'real' ham??

Pete Lucas PJML@UK.AC.NERC-WALLINGFORD.IBMA 0793411613

P.S. I speak solely for myself. If captured, the Government will deny all knowledge of my operations.

I believe that the R1 and R100 are available everywhere except places where ICOM America Inc. is the importer. IMHO, ICOM America Inc. decided not to import them because they are great cellular telephone receivers. Look for the IC-R1A with the cellular telephone freqs. deleted.

Greetings!

I can tell you how to enable the extended rec/xmit on a US version FT470,
but I'm not sure it work on your unit, so give it a try.

To extend the receive coverage on 2 meters to 130-180 MHz, turn off the unit
and hold down the up/down arrow keys on the keypad and turn the unit back on.
You may have to do this several times, but it should work. I performed this
operation on my friends' 470 and it worked the first time. By the way, it
also allows transmission from 140-150 Mhz. (This is for informational pur-
poses only, don't xmit out of band unless you have proper permits and such.)
This also extends the UHF range to 430-450 MHz.

Good luck and hope you get to use your unit abroad.

Test-taking is a learning skill, too, though, isn't it? Do you truly
believe that most of the people who pass the upper-level written exams
do so by blatant memorization, and then forget everything as they accept
their certificate of completion? I certainly hope that this is not true.
Particularly with the Advanced class written, I learned quite a bit,
even about the parts I flat-out memorized.

I would have found it difficult to go through _any_ of the written
elements without getting SOMETHING out of it. Believe me, I'm not
a class-A student, so I find it difficult to believe that I am that much
the exception.

And yes, to a certain degree, I believe that knowing how many lines
there are in an SSTV frame is a good thing to know, even though I will
never use that mode.

> provides roughly the functionality of current FM repeaters)? Phil Karn,
> are you still listening? [I got your other answer, but wanted to get
> more technical and ask more questions].

I would like to raise an issue that I haven't seen discussed and I do not
understand.

I did my doctoral thesis on spread spectrum about 20 years ago.
At that time I used a simple pseudo random signal to phase modulate
a signal.

I did experiments in the Lab and also correlated the theory to the
experiments.

One of the conclusions I came to was that the signal-to-noise ratio (SNR)
improvement of the spread spectrum signal is proportional to the bandwidth.
FM and other systems have a SNR improvement
proportional to the bandwith to a power.
(See any book on communications theory for the concept of SNR of
wide bandwidth signals).

Therefore, if I increase the bandwidth of the signal by 1000,
I get a 30 dB improvement in SNR.

This to me seems very inefficient compared to FM and other systems.

So my question is: are there any other more complicated
spread spectrum systems that get SNR proportional to the
bandwidth to a power?
If so what are they?
If not what have I missed about spread spectrum?

I am concerned that the push to an "efficient" spread spectrum system
may cause us to lose more frequencies.
Just like the "efficient" ACSB system needs new frequencies.

There are coming onto the market here in Europe, some new phone systems which, i believe, use speech digitising. Essentially they digitise & compress speech into 50ms bursts, and by interleaving, give a functionally full duplex circuit on a single radio frequency. This is intrinsically going to have implications for spectrum efficiency. Now this sounds just the sort of thing ham radio could use to advantage. And suitably engineered, it would exclude a fair bit of interference too.
Phones based on this technology are starting to appear here in Europe at surprisingly low cost; within six months or so I guess the digital speech-processing chips may find their way onto the general market.
Wonder which ham radio manufacturer will produce the first radio that dispenses with all the 'audio' stages & substitutes digital?

]
]Just use filters. Wideband filters with sharp skirts do exist; TV broadcast
]exciters are an existence proof. SAW filters in TV receivers are another
]example.

Thanks for the reply. One comment - obviously with suitable filters you
can limit the bandwidth any way you want to (within limits of intersymbol
interference). My real question is: how can you do this with readily
affordable filters? On repeaters, we normally use pass cavities on the
transmitter. Obviously if there is any significant bandwidth to the SS
signal, we need filters with more complexity - ie wide pass band with
low ripple, followed by steep skirts. This requires a lot more poles/zeroes,
which would be more expensive. Keep in mind that on a shared site,
transmit power might be 100W (+50dBm) and we may be protecting an
adjacent band receiver to -120 dBm - that's 170 dB of protection.
If we have that 100W spread across 4 mHz (say, on 2 meters), and we
are looking at interference to a 15 kHz wide receiver, we pick up
24 dB, so now we only have to knock down the out of band by 146 dB!
That's still a lot of attenuation. Let's assume antenna separation
gives us another 30 dB. We are now down to 116 dB of attenuation - stil
an awful lot. That's why we use extremely high queue cavities on narrow
band transmitters. This analysis ignores the natural fall-off of
out-of-band sidebands due to the nature of the spreading modulation,
but just outside of the information band, that shouldn't be very much.

Consider base-band filtering. It's sure a lot cheaper to filter
at low power at baseband than at RF at high power. Let's say we
make a PERFECT baseband filter. We STILL need an ULTRA LINEAR
modulator or the interference comes back. This is true of
either fast frequency hop or direct sequence.

Please understand that I'm not trying to challenge the idea of
SS. I'm just thinking out loud about the problems, in the hope of
getting some good feedback from the net.

4679. New Licenses Ideas ... comments welcome

Newsgroup: rec.ham-radio
Date: 1990-07-27 15:50:37 UTC
From: magid@select.enet.dec.com
Message-ID: <13973@shlump.nac.dec.com>
Source record: 9835

The following licensing idea came to mind after reading all of the notes in this file about the "Communicator Class" and "Incentive Licensing"

We could actually use our current system (already in place) and accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people into this hobby.

2. Have those already in the hobby expand their knowledge of the various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated. (not sure anything the government does is not complex)

Class Elements Options

Novice 2 CW 5 WPM

Technician 2,3a Pick (1) from list below

General 2,3a,3b " " " " "

Advanced 2,3a,3b,4a " " " " "

Extra 2,3a,3b,4a,4b " " " " "

Communicator 2,3a * (required)

Option List: (Aside from the code Exams these tests will be 25-30 multiple choice questions designed in the same manner as we have our tests designed today however the pool of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV
j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM Code will be required for upgrade to Technician. (this assumes that the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more to be a certain class then it does now.

DE WA0LHB IN COLORADO

>Are there interesting things for techies to see while vacationing in Colorado?
Yes, the mountains..... How about Caboose Hobbies (a really BIG model train store) in Denver? OK, you might be able to visit NCAR (National Center for Atmospheric Reserch) in Boulder (20 mi N.W. of Denver).

>Are there tours of WWV?
There used to be, I just called the station and they don't give tours any more. There isn't much to see, like any good electronics based lab.... a buncha boxes with weird electronics inside. The multi acre antenna farm with nothing more that a few dipoles strung from the tops of the towers realy isn't impressive.
I've seen funner ham shacks ;-).
WWV is 60 mi north of Denver, between Ft. Collins and Wellington, if you want to drive up just to say that you have been there.

> Cheyenne Mountain?
The kids wanted to take me there for a birthday present, at the time they wanted a security clearance, take about 6 months for that. There is a real good zoo on the mountain.

>Suggestions appreciated!
I'd like to go to Washington and see the Smithsonian!!!!!!!!

OK Here's what I've got so far ...
On some of these, I've put Thomas Guide map page numbers and coordinates
in square brackets.

Sacramento Area:

Elektronics, on Del Paso Blvd, 1 block south of Arden Way. Mostly
old electronic surplus, with instruments, radios, etc ...

HSC Electronics on Hemlock St north of AUburn Blvd. Mostly
computer stuff, with some generic electronics. This place is run by
Halted with other stores in Santa Clara and Cotati.

Marvac on Del Paso Blvd (a couple of blocks north of Arden way)
Some new stuff, lots of old stuff, mostly non-computer, generic
electronics.

San Francisco Peninsula:

Los Altos, Foothills College Flea Market, 2nd Saturday of every
month thru September. Everybody raves about this as THE source for
surplus goodies.

Mountain View, Haltek, 1062 Linda Vista. Good supply of surplus
discrete components, and scrapped subassemblies. (415) 969-0510.
There is one of these in Santa Rosa, on So. Santa Rosa Ave,

Mountain View, pizza place, on El Camino Real southbound just
south of Shoreline. This is the BEST Italian food I've had west of
Rome, NY. (You work up quite a hunger when surplusing)

Milpitas, Weird Stuff Wherehouse, off Montegue Expy

Milpitas, R&D Electronic Parts, 1432 S. Main St (408) 262-7154
[47-F5]

Redwood City, HDB, 2860 Spring St. Mostly new stuff now. [37-B2]

Redwood CIty, Allen Steel, Whipple Rd. (Edgewood Ave Exit off
101) [36-D3]

San Carlos, J&H, 476 Industrial Way, take Holly exit off of 101,
near corner of Industrial and Holly. Good supply of Aluminum tubing
and rod stock for antennas. Lots of aluminum, steel, and brass bar and
plate stock. Some plastics like delrin, and teflon. Some older

electronic components. reasonable supply of wire. (415) 591-7113 [33-D4]

San Jose, A to Z Surplus, next to Quement Electronics (on So. Basecom). Mostly surplus instruments, spare parts, and junk.

Santa Clara, Halted Specialties Ltd. 3500 Ryder Ave; Corner of Lawrence Expy and Central Expy. Lots of computer, some retail ham, lots of surplus discrete parts, and some instruments. This is the same as HSC. (408) 732-1573 [53-D3]

Santa Clara, Advanced Component Electronics, 911 George, 3479 Kifer, Usually not open on Saturdays, (408) 730-4660

Oakland/Berkeley

Belmont, Jameco, 1355 Shoreway Road, (415) 592-8097.

Berkeley, Electronics Etc, 2738 10th St (415) 845-0169.

Oakland, Alongside 580 Freeway, lots of components and test equipment

Oakland, Mike Quinn Electronics, 1080 Langley (415) 569-1539.

North Bay

Cotati, HSC Electronics (see Halted, above).

Santa Rosa, Haltek, So. Santa Rosa Ave. (see Haltek, above).

Santa Rosa, Bataeff Salvage, 244 Mountain View Ave, Scrap Metal, Rope (including Mountain climbing ropes at great prices). Misc surplus junk.

Greater Los Angeles

Hollywood, Op Amp Books, Best source for technical books I've ever seen ... our corporate library deals almost exclusively with them.

Pasadena, C&H Surplus, Colorado Blvd at Allen

Redondo Beach, Gott Electronics ... The Best for lasers

???, Davilyn and CS Sales, Mixed Goodies, like motors and stuff.

Other

Kitchener-Waterloo, K-W Surplus on Victoria at Hwy 86

Toronto, Active Electronics, Queen W near Spadina

Atlanta, Quality Computer Components

Atlanta, Peachtree quality salvage

Utica, NY, Central Electronics, Lots of components, relays,
motors, test equipment. Good prices.

Have I missed any?

I just started skimming through the ARRL extra study manual. It seems odd to me that they have as much as they do on space operation regulations. Since they only apply to transmissions originating in space (not someone on earth using OSCAR), how many hams could these rules apply to?

If I was going to launch a satelite or operate from a space shuttle, I would certainly check the rules again rather than count on remembering them from the extra exam (and hoping they hadn't changed).

I am not saying the exam should be easier, but having questions about these rules in the pool means they must be displacing ones of more practical import.

As I said, I was just skimming through, so maybe I am missing the big picture.

No, at least not of the antenna farm NE of Fort Collins.

I know we do site tours here at this HP site, but only for groups and organizations, I believe.

Anheuser-Busch does have public tours of their beer plant (also NE of town).

NOAA allows public visiting (and tours?) of their Table Mesa site (NCAR, National Center for Atmospheric Research) in Boulder -- worth a drive up just for the scenery. But their hours are limited; call them.

>small strong one :=) ...

I recall one of the hobby electronics magazines (Popular Electronics?
Radio-Electronics?) ran an article on "liquid semiconductors" sometime
between May '68 and June '69 - maybe it was the April 1st issue. :-)
Don't know how they formed the PN junctions. :-)

(I recall looking at the article, and yes, they were building components
in jars - but I didn't have the money then to buy the magazine. Anyone
else remember it? Now I am curious.)

>And how about batteries with household chemicals (ie not sulphuric)

I only tried once, in a few idle moments some time ago, with some
alumin{i}um foil, square of paper, a copper penny, and saltwater. Got
something like .6V open circuit, 1 mA short circuit (for a second or so,
then it started to drop to some lower level). I'm sure it could be greatly
improved. :-)

[I've added sci.chem to this because this is getting into their realm.
Any ideas, anyone? ..Larry? :-)]

> What is the best way to get started?

I stopped putting it off when a convenient, free, local course was put on by some hams. You don't need to do that, though. Self-study would suffice.

> Where can I get good books to get started on it...

I recommend "Welcome to the World of Ham Radio", by the ARRL, available for about $20 with Morse code study tapes from many electronics stores. It was fairly complete, well organized, easy to digest, and included the Novice question pool. The tapes are good too.

> ...is it possible to learn everything that is required for the test
> through self-study...

My opinion: Yes, given the above book and tapes.

> ...is it necessary to take an official course and pass it?

No, only to take an official, correctly-administered test and pass it.

> I should think that receiving and monitoring airwaves is perfectly
> alright on any radio band?

All but cellular phone (I think). Listening there is illegal.

> I would appreciate any help that you can give me and any suggestions
> that you may have...

Find someone who's been a ham a while and who's willing to help you. For example, borrow a radio and listen during the weeks before you take the test.

Good luck, and have fun! You might start by writing down your goals and interests in the hobby, so as to help you remember them as you study and learn. It can be overwhelming. I focused on the union of "what I'm interested in" and "what I must know to pass the tests".

(stuff deleted)

Sorry, but I think I *am* paying... every time I get my cellular phone bill,
I can't help it but to think that my bill could be lower, or the service
better, or both, if frequencies now allocated to your hobby/service were to
be given to the cellular industry.

But unless what you want to cool is really quite a bit hotter than
its surroundings, or you are operating in a vacuum, you are going to
want good convection; the percentage of cooling that takes place
from radiation for a transistor heat sink is, I believe, quite low.

Ah yes! the FM broadcast problem! A new tower was just
erected in my neighborhood with TWO (count em) FM broadcast
stations on the tower. My R7000 gets de-sensed by
the 50KW signals from these stations. There are some
good programs in BASIC for designing your own notch
filter...the program I'm thinking about is on most
ham bbs's and is called ECD(electronic circuit designer).
I may get around to doing this one of these days. Also I have
used Pspice to simulate the response from filters
designed using ECD. Normally you can expect
about ~6dB of insertion loss; a gasfet preamp after
the filter can make up for this. In summary the R7000
can get overloaded from strong signals like FM stations.

Regards,
Charlie Thompson WB4HVD

Since you can't help thinking, you'd better explain yourself. Why would cellphones be cheaper if more spectrum were allocated? Certainly, this would not affect the price of the hardware. Also, with the exception of the LA basin, the existing allocation of 20 MHz has yet to to be saturated. Finally, the newer cellphones will be digital, initially more expensive, and will run from 1.3-1.5 GHz.

Frankly, cellphones WILL become VERY expensive if we don't train people to design, build, and repair them. That's at least one of the justifications for amateur spectrum.

Back in high school it occurred to me that it might be possible to build a liquid state "tube". Immerse the electrodes in an electrolyte solution and see what you can make it do... I didn't know enough electronics, physics, or chemistry (though I thought I did) to give it a fair test at the time.

Anybody know whether it is possible to get gain out of such a device? Granted its lifetime is very short, but it compares well with the properties of homemade vacuum tubes (if it works, of course).

Well, in fact, when I saw the article, my first reaction was "Oh, great, yet another computer weenie using massive overkill to solve a fairly simple problem."

The article states "This project is just one more example of how microcomputers are changing the shape of Amateur Radio," and at $125 for a battery charger, I should certainly say so.

> packet switch that need not transmit and receive simultaneously.

A linear translator has its own disadvantages. I was thinking in terms of
repeaters of the type that deal with one signal, and bring that signal to
a standard level before retransmiting it. FM and digital voice do this,
and I certainly would want to detect and reconstruct the signal at the
repeater before noise and errors build up beyond detectability. But maybe
there is a way I don't know about to do SS repeating w/o the problems of
a linear translator system.

> >Use bandpass filters in the sinusoidal domain.
>
> What does this mean?

A conventional bandpass filter. By "sinusoidal domain" I meant to rule out
filtering in other domains such as time, code, etc.

> Therefore no additional steps are needed to eliminate spectral lines (other
> than picking a long enough shift register).

If the the RATE of the stepping of the shift register is 1 Mhz, for instance,
then we will see peaks and valleys at that interval. There will, of course,
be a noise-like signal and so the peaks won't be much. I think maybe the
problem here is that the rate needs to be high enough to properly spread over
the desired bandpass. 1 Mhz, while getting you out beyond 1 Mhz, isn't right
since the information beyond 1 Mhz is redundant. Or maybe for some reason
you want the redundancy.

I guess I need to get out an FFT and play around with the spectrums some.

Alkaline technology is different than the classical LeClanche cell, and it has a polarity reversal the way they are making them. The POSITIVE side is connected to the cell case, usually in one solid piece. Most flashlights have the NEGATIVE end of the battery on the downside, and thus the case of the flashlight (metal one) is NEGATIVE and can short out with the POSITIVE cell case if the insulation wears through. This is also a nasty problem for those little 9 volt batteries, which have 6 miniature cells inside. I took one of these apart once after it was "dead" and after having done this, at a later time, managed to get a cell shorted. It blew its guts out the bottom. Just makes you wonder the power of a fresh D-cell.

Julian, your comments are not without some merit, but I think you may be missing something here... First Amateur Radio and Cellular telephones each have their place in emergency communications.

If the disaster is localized (say an airplane crash or high-rise fire) there is no reason why cellular telephones can't be used. GTE even offers a free package called a "GO-PACK" with five telephones, portable fax, and a technician (for training) to any emergency agency on a per incident basis for just a telephone call. This capability may be all that is required in a small incident.

In a larger incident (like the Loma Prieta earthquake) the cellular telephones just won't work for the initial response! Several people have commented about "How the cell sites stayed up during the earthquake", but I haven't heard anybody comment about who they talked to when PacBell shutdown exchanges! It doesn't do much good to be able to connect with the cellular carrier and not be able to tie into the local telephone company! I live and work in the heart of "Silicon Valley". For two days after the earthquake I was unable to call

my home because PacBell shutdown exchanges. My only contact with my home was via amateur radio (my wife is a ham and my 2 daughters had their last Novice class the day before the earthquake!)...

An observation I have made recently. Even with 800+ cellular channels that are available, I am getting more and more busy signals when I try and use my cellular phone. This is during commute times, but is probably symptomatic of what would happen in a disaster. Every agency from the State "Office of Emergency Services" to "Bill's Towing" is going to try and use their cellular. I just don't know of a way to say "Break - Emergency Traffic" to someone using a cellular channel I need to pass traffic on - DO YOU?

I also offer the following facts based on my discussions with Santa Clara County OES, GTE Mobilnet, and Pacific Bell::

Fact: Cellular telephones don't work SIMPLEX!

If the cell site goes down, or the local carrier goes down - your sunk! In the Santa Clara Valley we run monthly SIMPLEX radio checks from the Emergency Communication Center for each city (all 11 of them) to the County Communications facility. We ARE an active part of each of these cities emergency action plans!

Fact: You must have the telephone number of the person you are calling!

This requires a LOT of preplanning on the part of all the cooperating local emergency organizations. Don't count on directory assistance being available as they might be located in another city (directory assistance for San Jose is located in Salinas - 60 miles away).

Fact: Not all area's provide cellular coverage!

Steve (KA6S) commented last week about trying to use a cellular telephone during the "Long Gulch" fire. This fire was only 30 miles from the heart of Silicon Valley, but had a 4000' mountain between us and the valley. My cellular stopped working as soon as I started down the back side of the Mt. Hamilton!

Now don't think I am completely against cellular, because I'm not! I bought my cellular to supplement my amateur emergency communications capabilities. If I see an accident on the way to/from work, I try my cellular first. If it doesn't work (BUSY!), I switch to any one of a dozen repeaters I use and autopatch! I have even relayed accident reports from amateur radio to 911 via my cellular telephone when it was appropriate to do so.

The whole idea here is that each system has its advantages and disadvantages. The debate here is not which service is better, but how they can work together in a given situation. We started off the Loma Prieta earthquake with amateur radio, and passed it over to cellular 96 hours later. As for me, when the next earthquake or fire comes (and it will) I'll be ready with spare batteries for both my cellular and my HT. My hobby is communications, and that means using whatever equipment is available to get the job done. Egos don't save lives and property, skills do!

Ok... I have my NOMEX suit on... FIRE AWAY!!!

As quoted from <9007260548.AA16565@tecnet1.jcte.jcs.mil> by mgb@TECNET1.JCTE.JCS.MIL:

```
+---------------
| >> I don't know about the rest of you but I would prefer not messing up
| >> my back yard! I know all the flames that this comment will generate
|
| > I **DO** want them in MY backyard !!
|
| Ok Phil.. let's for a moment suppose that the Novice License is saved. Where
| THEN is the central meeting ground for ALL of HAM RADIO? Hint... Novices
| already have 220 privileges. We need to populate 220.... and it has
| propagation that (IMHO) rivals or exceeds that on 2 meters. Yes.. I like
| the 220 band and admit I am opinionated about it.
+---------------
```

YESYESYESYESYESYESYES!!!!!!!!

I'm on 220 --- one of those Novices you spoke of --- and I've noticed that 220 seems to be open around here more often than 2m is. over the past few days, the 2m types have been talking about getting in to Pennsylvania (I'm in Ohio) or Ontario with mobile 2m rigs... 220 was so wide open that I got in to a repeater on the far side of the state with 1 watt. (If only there were more 220 repeaters, so I could have had a chance to go even farther!)

```
+---------------
| Let's say that the current proposal goes through and Communicators get
| "stuck" on 220. Are you going to push to get a repeater going on that
| band? We did here for Novices, and we also put links on it to 2 meters
+---------------
```

LCARA did here, and I benefitted. And I'm willing to work to keep it going.

I really don't know where to go with this discussion. There are reasons I can see for both sides; on the one hand, putting Communicators on 220 only leaves 'em without much in the way of support, but permitting them on 2m doesn't help get anyone onto the other bands. In case you haven't noticed, the bottom end of 220 is gone --- how long before the FCC eats the rest of it, because all the Communicators are on 2m OR BECAUSE NOBODY WANTED TO BECOME A COMMUNICATOR ON A BAND THAT HAS NOTHING ON IT? Force Communicators on 220 with its current lack of infrastructure and the few folks who *do* become communicaotrs will upgrade to Technician and move to 2m out of loneliness. Boy, will we have achieved a lot, huh?

I think it would be best to do two things ---

(1) Allow Communicators on all VHF/UHF bands; but BEFORE YOU DO:
(2) GET SOMETHING GOING ON THE OTHER VHF/UHF BANDS!!!!!!!!

220 is virtually dead around here. 440 has a little traffic; not much. And 1240 is COMPLETELY dead. I had the chance to pick up a 1240 HT at Dayton, but picked up a repeater guide first --- and switched my plans from 1200 to 220 because there is no 1200 activity listed for this half of the state. And discussions with local hams have confirmed it: there's a little activity at 10GHz, but the 1270-1295 Novice band is completely empty. Had I picked up the 1200 HT, I'd probably have become disgusted enough to drop ham radio entirely. This is what we risk for Communicators if we don't get something going on the bands above 2m.

And, more importantly: the same considerations keep most current hams from moving off 2m. Let's face it --- very few hams are willing to jump on to an empty band in an effort to lure others up there. If some clubs are willing to sponsor 220, 440, 900, and/or 1200MHz repeaters, they should do so; get the ball rolling and hams will follow it.

It's only my penchant for pushing lost causes that has kept me on 220. I am considering what I can do to entice Novices onto 220 locally; I hopefully won't be stuck with *only* 220 for long, but probably won't give it up entirely. (Yesterday's DX gave my interest in 220 a major boost....) And if I can get some activity going on 220, I can hope that it engenders more activity, and so on. And then someone can see what I did and start a local repeater on the 902-928MHz band, or the 1270-1295MHz Novice band....

Go for it.

No, you want to filter off everything beyond the first null. It's redundant.

A direct sequence transmitter is nothing more than a BPSK modulator, except
that the modulating stream is a high speed pseudorandom sequence. All of
the principles of BPSK apply, including the need to filter the signal
in order to get rid of the unnecessary sidelobes. What's left in the main
lobe will look like wideband noise, except that the spectral density will
fall off toward the edges.

Phil

An old boss, Bruce Banks of NASA Lewis, did lots of experimenting with
making "diamond-like" films in hopes of solving that problem. While
I gather (since I don't see his name in People ;-]) he never struck a
gusher, it was an interesting approach.

Source record: 9866

While most of the information in the posting by WA6PEZ is correct, Tom is way off base on one major point. The American OTH Radars ARE NOT woodpeckers. Unlike the Russian OTH Radars, the American OTH Radars use a chirped (frequency-swept) signal that does not sound anything like the woodpecker-like signal of the Russian radar. Furthermore, the US Air Force claims that it chooses the frequency bands in which it operates to minimize interference to other services, and I understand that they completely avoid the amateur and broadcast bands.

As hams, it would certainly be worthwhile to keep our ears open for interference that would indicate a change in operating practice, but the site in Maine has been operating for about five years now and, according to newsletters published by the Air Force, the Air Force has yet to receive any interference complaints.

So, let's not assume that all OTH radars are "woodpeckers"; there are many ways to do OTH radar, and the US Air Force appears to have learned by observing the older Russian radar that the woodpecker method is not desirable.

=========
SpaceNews
=========

MONDAY JULY 30, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* NEW OSCAR! *
==============
Pakistan's first Amateur Radio satellite became reality when SUPARCO,
the Space and Upper Atmosphere Research Commission of Pakistan, announced
that BADR-1 was successfully placed into Earth orbit on 16-Jul-90.
A Chinese booster was used to place the payload into a 28 degree inclination,
elliptical orbit.

BADR-1 is presently transmitting on 145.825 MHz FM and has been copied on
several occasions here at KD2BD. A steady 2400 Hz audio tone was received
under heavy signal fading, probably due to the high roll rate of the young
spacecraft. Capabilities of the satellite are not yet known.

Here is a Keplerian element set for use in tracking BADR-1:

Name : BADR-1
Object # : 20685
Epoch : 90 198.08455059
El Set # : 7
Incli : 28.4931
RAAN : 297.7287
Eccn : 5.62305E-02
ArgPer : 138.0890
MeanAn : 226.3844
MeanMo : 14.90429605
Drag : 1.9729E-03
Rev : 16

The orbit if BADR-1 yields an apogee distance of 982 km (530 nm) and a
perigee distance of only 198 km (107 nm). At perigee, the spacecraft
travels at 28,805 km/hour (17,899 mi/hr). This very low perigee will
greatly affect the decay of the spacecraft, and it is not expected to

last very long in an orbit such as this.

* HITEN NEWS *
==============
According to Professor Uesugi, ISAS, Japan, the Hiten spacecraft made its second lunar swingby on 10-Jul-90 at 18:58:34 JST (=UTC + 9hrs) at a selenocentric distance of 76,083 km. The third swingby is expected on 04-Aug-90.

[Information via Yoshiro Yamada at the Yokohama Science Center, Japan]

* MAGELLAN NEWS *
=================
One of Magellan's erratic gyroscopes experienced an electrical failure when it was turned "on" on 20-Jul-90. Gyros are used on Magellan to maintain attitude control. Two gyros are needed to maintain control in all three axes of the spacecraft. A remaining spare will be used as a backup.

Magellan will reach the planet Venus on 10-Aug-90 after its 15.5 month voyage to the planet after being deployed from Earth orbit by the Space Shuttle Atlantis on STS-30 on 04-May-90. Magellan's primary mission is to map 70 to 90% of Venus' surface with ten times better resolution than any achieved before.

* DOVE NEWS *
=============
DOVE was turned back on recently. Many people reported copying its VHF beacon, but I have not been able to copy anything from the satellite in the past few days. The reason for the lack of VHF telemetry is unknown.

^^^^^^
> amateur spectrum.

Now days, most equipment, if it is cheap enough, is just NOT repaired.
The cost ratio of actually getting INTO the equipment compared to the
cost of making it, is so high it is not worth it. Of course minor
things like a loose antenna connector MIGHT be fixable if you or the
repairman can get inside without destroying the unit.

BTW, I notice some SIGNIFICANT pricing cutting for cellphones these days
that require you to sign up for new service. I am suspecting that the
cell service providers are pushing for more customer base (even in Chicago
where I see these ads from).

One thing to be aware of about these cell phones, be sure you insure them
for full cost. You might not get the same deal to replace one.

-> I can't believe we've not seen at least one messgae noting the
-> lead article in the August QST :-) Are you all out there
-> building one?

.Well, in fact, when I saw the article, my first reaction was "Oh, great,
.yet another computer weenie using massive overkill to solve a fairly simple
.problem."

.The article states "This project is just one more example of how
.microcomputers are changing the shape of Amateur Radio," and at $125 for
.a battery charger, I should certainly say so.

Right. If you want to charge batteries, rather than play with computers, get copy of Motorola Engineering Bulletin EB126 "Ultra-Rapid Nickel-Cadmium Battery Charger". I quote from the intro: "We are going to present an ultra-fast nickel-cadmium battery charger capable of completely charging 8 to 12 batteries at 1.2 to 1.8 Ah in 30 to 45 minutes. This is currently possible due to new sintered electrode technology used by battery manufacturers which provide rapid charging plots."

The highest tech part is a UC3843 Switchmode converter to boost the starting voltage so you can run from a 12 volt source. PCB layout and parts list is provided in the Bulletin. Estimated cost $50.

Paul Flaherty on 27 Jul 90:

>Since you can't help thinking, you'd better explain yourself. Why would

Frankly, I don't have hard facts. That would require survey, data analysis, etc, and all it would provide is confirmation of a basic truth that we already know about: there is no free lunch. Anything that is in limited supply does cost (land, water, spectrum...)
Lately we've been hearing a lot about how saturated landline phones AND cell phones become in case of an emergency. A gut reaction is "if they had more channels, the saturation threshold would be higher, right?"
Also, more channels = more customers = lower cost per customer, right? (At least, that's what has happened for just about anything I can think of)
So, since we are not really arguing about this basic truth, the question could be "Am I willing to pay for your 'service' through a higher cell phone bill?"
I might, but then we'd have to enter a less ambiguous contract: how do I access your 'service'? where do I find you when I need you? can you guarantee the accuracy of your 'service'? (sorry, but "your cousin in SF is ok" just won't do... when I *hear* her voice I will *know* she's ok...)
I would like to extend my sympathies to all volunteers of all kind, whether it be driving an ambulance, or preparing hot food in a shelter. I hope these comments will not be interpreted as an attempt to minimize their (in)valuable contributions. However, I'm wondering if in the case of emergency communications, ham radio is the *best* we can have... comments anyone?

>modulator or the interference comes back. This is true of
>either fast frequency hop or direct sequence.
>

In our 100,000 watt TV transmitter, the sideband filter is a little
SAW filter you can hold in the palm of your hand. In our old 50,000
watt transmitter the filter was a huge water cooled monster on the
output of the transmitter. The SAW filter is installed just after
the modulator at the 100 miliwatt level. Assuming reasonable

linearity (<2%) in the following power amplifiers, this little guy can do the job nicely. Assuming your PA doesn't act as a wideband noise generator on it's own, you don't need huge cavities anymore. Transmitter and filter design have changed dramatically in the last ten years. Nobody does "high level" modulation anymore and achieving linear power is much easier than it used to be. Amateur technology has a long way to come from the old Micor to the modern world.

WOW! How funny you should ask this, I was just sitting here looking at
my service manual for the PRO-34 thinking the same thing....

Anyway the chip is IC-9 and its located on the LOGIC board (the one
you cut the diode on to get full 800Mhz). Its at the top of the board
close to the squelch knob. The manual says:

IC9 Audio Amp. BIPOLAR LM386N-1

Let me know if you find a good replacement and how it works, id like
to at least double mine to 400mW if thats possible without killing the
battery to fast.

If you get the same number of customers/channel, it will be just as crowded
no matter how many channels, so where is your lower cost?

So, since we are not really arguing about this basic truth, the question could
>be "Am I willing to pay for your 'service' through a higher cell phone bill?"

But who are you paying, and should we care? Your local carrier
doesn't pay anything to the government (ie the common good) for that
spectrum. Am I willing to pay for your cellular service through
the loss of spectrum?

How about if the government leases 1 mhz of microwave space
for cellular for a few billion and splits the proceeds among the 300,000
or so hams? Believe me, they have pulled wackier deals than that,
especially in agriculture.

>heard around here in years.

Gary... do you remember what the EXACT Novice frequency allocation was on 2 meters for that period? It wasn't the whole 2 meter band. I am reaching back ... way back ... but I don't think that Novice privileges included 146.34//146.94 I might add that not too many areas had ham repeaters in 1964 ... rural or urban. What I am really saying here is that the Novice voice allocation and the state of the band in 1968 did not lend itself to a general meeting ground and training area for new hams. Your original posting would lead one to believe that. I was only trying to point out that it is not fair to compare "those" days to "these" days to make a point for your discussion. You've got me curious, I am going to go look around for the exact Novice frequency band of 1968.

>>What you say was true when the Novice License expired after one year.
>>Now it's good "forever". Novices ARE real hams. I like Novices more
>>than just about any other class. They are USUALLY the most eager to
>>learn and do not make any pretensions about knowing everything there is

>Most are so eager that they upgrade in a few months and are gone forever
>from the novice band. The others are the wives of hams who were pressured
>into getting their licenses so they can talk to hubby. They are rarely
>willing to talk to anyone else.

You left out the third class. Those that are perfectly satisfied with the Novice and see no need to learn any more code or theory in order to upgrade. After all... some Technicians do that and see nothing wrong with it (and I agree with them), so Novices naturally have the same privilege. Many Novices that upgrade immediately head back to the Novice bands to work their old friends and to help others learn the code. I did, and I encourage those that I test and teach to likewise do the same.

>>If the test for Communicator Class requires one to study theory real hard
>>and has an exam that looks for knowledge, instead of an ability to memorize
>>answers then I say CW should be dropped like a hot rock.

>I have always contended that it is easier to understand something than to
>memorize it. At least this is true for me.

First I am not all that sure that what you are saying is true. It may be easier to learn than to memorize a WHOLE SUBJECT from top to bottom, but if the object is to just pass a test ... well there are a lot of people that apparently are not like you in this regard. They memorize. You also have to consider that a lot of people don't WANT to learn the subject, they just want the license. It takes longer to LEARN basic electricity than it takes to memorize ohms law for a test.

>And I don't understand the need to test for a mode that is not commonly
>used on the frequencies granted by the license.

If the licensed person is granted the privilege to operate this mode, then it holds true that some basic understanding of the mode should be tested for. The fact that it is not commonly used RIGHT NOW should not detract from that. The only way to do it otherwise is to test someone only on

what they are interested in. Then what? Do they get access to "those other modes" by default, or are they withheld?

I will admit that testing someone on the rules and regs for what is required to operate (a ham station) FROM a space platform is a little much (!!) but that should not be proof of point for the whole concept.

Here are some of my 90-55 comment tidbits:

In FCC Docket Number 90-55: [I use CAPITALIZING to highlight here]

> IV. PROPOSAL
>
> 15. We believe that the petitions have merit. Further, like
> the petitioners, we believe that this is a propitious time to
> propose the establishment of a codeless license, given the
> advances in electronic communications in the past few years. We
> propose, therefore, to establish a codeless class of amateur
> operator license, the Communicator Class. With respect to this
> proposed operator class, we have established three objectives.
>>>>> OUR FIRST OBJECTIVE IS TO OFFER AN ENTRY LEVEL LICENSE
>>>>> OPPORTUNITY TO ALL PERSONS WHO FIND THE TELEGRAPHY REQUIREMENT A
>>>>> BARRIER TO PURSUING THE PURPOSES OF THE AMATEUR SERVICE. Our
> view is best expressed by the statement of the ARRL that "THE
>>>>> GOAL OF THE CODELESS AMATEUR LICENSE IS TO BRING SUCH LICENSEES
>>>>> IN TO THE 'MAINSTREEM' OF THE AMATEUR RADIO SERVICE, AND TO
>>>>> ENCOURAGE THEM TO UPGRADE THEIR LICENSE CLASS."(51) Our second
> objective is to propose a type of license that can be implemented
> quickly if a decision is made to proceed. Our third objective is
> to avoid any negative effect upon current licensees, upon the
> work of the volunteer examiners, or upon the Commission's

The above statement suggests that the Communicator class will be an ENTRY level license class, but the PROPOSAL to remove the Technician class for future licensing is a CONTRADICTION. To where is the Communicator expected to upgrade?

> 17. Operator license structure. In proposed Section 97.9,
> we would incorporate the Communicator Class in a simplified
> license structure containing four ascending steps: Communicator,
> General, Advanced, and Amateur Extra Classes. Current Technician
> and Novice Class operator licenses would be grandfathered
> indefinitely. There would be no new licenses issued for those
> license classes, but existing licenses could be modified or
>>>>> renewed. THIS APPROACH WOULD MEET THE OBJECTIVES WE ESTABLISHED
>>>>> IN PARAGRAPH 15. Dennis and Linda Welch, John McCord and SCATG
> suggested preserving the five-step ladder by eliminating the
> telegraphy examination requrement from the Novice class license.

The FCC has **NOT** establish any connection whatsoever between the objectives in paragraph 15, and the concept of removing the Technician or Novice license classes from future licensees. It has been suggested this move is REALLY to reduce the burden on the FCC in processing upgrades.

I say keep the TECHNICIAN class and remove some other class, or better yet just clean up the whole licensing structure.

> 18. For future licensees, the Communicator Class license
> would be the first step in the license structure instead of the
> Novice Class. Our premise is that most newcomers to the service,
> given the choice, would elect to qualify for the Communicator
> Class license rather than the Novice Class license. There would,
> therefore, no longer be a need for the Novice Class license, We
> particularly invite instructors, volunteer examiners (VEs), and
> VECs to submit comments on the validity of this premise,
> including factual information on the time and effort that would
> be required for persons to prepare tor the proposed 60 question
> Communicator Class written examination as compared to the time
> and effort currently required for the Novice Class 30 question
> written examination and telegraphy examination.

The FCC **FAILS** to address the issue of what the NEXT STEP that new licensees will be expected to follow (if any).

> 19. Because the written examination for the Communicator
> Class license would be more comprehensive than that of the
>>>>> Technician Class license, THE COMMUNICATOR CLASS WOULD ALSO SERVE
>>>>> IN THE STEAD OF THE TECHNICIAN CLASS FOR FUTURE LICENSEES. Each
> step in the proposed four step structure provides recognition
> that the holder has significantly advanced his or her skill in
> both the communication and technical phases of the radio art.(56)
> This structure could be rapidly implemented. The present license
> application processing system and license application form would
> continue to be used.(57)

The HIGHLIGHTED portions of paragraph 19 above and paragraph 20 below are in DIRECT **CONTRADICTION** !! The Communicator class CANNOT "serve in the stead of the Technician class" if it does not have ALL privileges above 30 Mhz as the Technician class now has.

> 20. Operator Privileges. The proposed control operator
>>>>> PRIVILEGES OF THE COMMUNICATOR CLASS WOULD GENERALLY BE THOSE
>>>>> SUGGESTED BY THE ARRL. The privileges would include all
>>>>> authorized emission types. THE PROPOSED TRANSMITTER POWER
>>>>> STANDARD WOULD BE 200 WATTS PEAK ENVELOPE POWER. The licensee's
> station would be eligible for a Group D call sign.(58) Stations
> with Communicator Class control operators would not be permitted
> to transmit on the 2 m and 6 m bands. In view of ARRL's desire
> to bring the codeless class into the mainstream of the amateur
> service,(59) however, we particularly invite comment on the
> effect of excluding Communicator Class licensees from these two
> popular bands.

> 21. The ARRL stated that one premise for its petition was
> that an accommodation should be made for codeless class licensees
> to upgrade their license class. It cited countries that have

> codeless licenses where the written examination tests the
> examinee's technical qualifications. The ARRL stated that
> amateur service societies in countries such as Australia, the
> Federal Republic of Germany, and Belgium report ongoing
> telegraphy activities among the codeless class licensees working
> to upgrade the license class.(60) While the proposed
> Communicator Class privileges include telegraphy on the 1.25
> meter and shorter wavelength bands, we recognize that telegraphy
> operation is more closely assiciated with the HF bands. The
> opportunity for newcomers to the amateur service actually to send
> and receive messages in the Morse code on small segments of the
> HF 80, 40, 15, and 10 meter bands is provided to the Novice and
> Technician Classes so that those operators can gain an
> appreciation of telegraphy tand acquire the proficiency needed to
> pass the telegraphy examination for the General Class operator
>>>>> license. WE SPECIFICALLY REQUEST COMMENTS, THEREFORE, CONCERNING
>>>>> THE DESIRABILITY OF INCLUDING THE OPPORTUNITY FOR COMMUNICATOR
>>>>> CLASS LICENSEES ALSO TO EXPERIENCE ON-THE-AIR TELEGRAPHY
>>>>> OPERATION ON THE HF BANDS. In view of our obligation under the
> provisions of the international Radio Regulations,(61) if it is
> desired, only domestic communications on the HF bands would be
> authorized.

If you add HF privileges to Communicator WITHOUT a code test, then what
is the difference between that and just taking away the code test from
the TECHNICIAN class requirements? NONE!

Not that such as a bad idea, but why both even creating Communicator.
Just remove the code test from Technician and improve the written exam
and stop there. We don't even need Communicator is this case.

> 22. Under proposed Section 97.301(g), a Communicator Class
> licensee who passes, or otherwise receives credit for a
> telegraphy examination, would be authorized the additional
> privileges of the Technician Class.(62) To avoid a license
> processing burden, however, the documentation of the passing of,
> or credit for, a telegraphy examination would be evidenced by the
> Certificate of Successful Completion of Examination (CSCE) issued
> by the administering VEs,(63) rather than by the issuance of a
> Technician Operator license. Theindicator used by the
> Communicator Class for identification purposes would be AC.(64)
> Under propsed Section 97.505(a)(1), VEs would be authorized to
> grant examination credit, evidenced by a CSCE, to a Communicator
> Class examinee for the slow speed telegraphy examination when the
> examinee holds a Novice Operator license.(65) That combination,
> Communicator Class license and CSCE, would permit the
> Communicator Class licensee the same rights and privileges of the
> Technician Class operator. The VECs would provide listings, in
> paper or magnetic for, of the Communicator Class licensees who
> have been issued the CSCE.

This would require the Communicator with code to constantly sign that annoying suffix **FOREVER**!!

In addition, there would be almost NO opportunity for other amateurs to verify the validity of a Communicator licensee using such an indicator on bands earned by passing only a code test.

I even suspect that the FCC doesn't even have the authority in the Communications Act to do this.

> 23. Volunteer examiners. The instant proposal contains
> substantive changes in the amateur operator license examination
> procedure and the issuance of amateur operator licenses and
> CSCEs. All operator license examinations would be administered
> under the VEC system.(66) The additional task of administering
> the Communicator Class would be offset by the elimination of
> other tasks, included the discontinuance of the two-examiner
> system for the Novice Class license.(67) The coorination and
> oversight by the VECs provide more credible results than does the
> two examiner system. In the latter, examination administration
> errors are more common and cheating is a greater problem than in
>>>>> the VEC system. THE TASK OF ADMINISTERING NEW TECHNICIAN
>>>>> OPERATOR CLASS LICENSES WOULD ALSO BE DISCONTINUED.(68) The
> Novice and Technician written examinations would no longer be
> prepared and adminsisted as separate examinations. The VEs and
> VECs, moreover, coulb e reimbursed for out-of-pocket costs
> incurred in connection with all examinations.(69)

>>>>> (68) Some 10,000 to 15,000 persons qualify for the Technician
>>>>> Operator Class license annually.

Apparently the FCC wants to eliminate the workload involved here, but in so doing will be creating a class of outcasts who will perpetually be appearing to be waiting for a license to arrive.

I have not seen this mentioned yet, but the FCC proposal 90-55, if adopted as is, would eliminate the 220-222 Mhz band IMMEDIATELY, rather than later on when service rules for land mobile services are adopted.

I think the aforementioned article would be better titled "A Microcomputer-Controlled NiCad-Battery DIScharger." If you look closely at the schematic, especially the interface between figs 1 and 2, you will note that there is no direct path between the constant current source and the battery, and furthermore the MOSFET pass transistor is bridged across the battery terminals.

I would also recommend heatsinking regulator U11, as its output is shorted directly to ground.

In other words, do not try to build this device from the QST schematic...

John,

You're quite right, protecting a nearby user on a frequency next to a spread spectrum transmitter could be difficult. I can't offer much advice since I don't have any actual experience with spread spectrum, but I can say that most of the systems I've read about seem to operate above 1 GHz and are not operated from fixed locations where EMI would be a problem.

Maybe somebody else out there can relate some practical experiences?

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

4727. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-07-29 06:19:01 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9007302136.AA24017@ucsd.edu>
Source record: 9733

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

Donald P Perley (crdgw1!galaxy@uunet.uu.net) on 29 Jul 90:

>If you get the same number of customers/channel, it will be just as crowded
>no matter how many channels, so where is your lower cost?

How that works is a mystery to me too... I think it has to do with fractions, something I've never been good at, but if you take the *fixed* cost of some items (ie, towers) and divide it among a *greater* number of customers, you end up with a *lower* cost... So, there may be the same number of customers per channel as before, but not the same cost per customer... get it?
What's keeping my cell company from serving more customers is the availability of channels (spectrum, that limited resource a chunck of which is allocated to you). So, by not getting the lower cell rates that I could, I am *indirectly* paying for your hobby/service.

> Am I willing to pay for your cellular service through
>the loss of spectrum?

You ARE paying. In case of an emergency, you're doing nothing but "pay back" for the privilege extended to you during "normal" times.
In other words, your exclusive use of a limited resource (spectrum) is payed for when the emergency arises, in the form of 'public service'.
Whether I'm willing to take advantage of your service or not, that's another story. In the case of my cousin, last fall I chose not to collect, for "reliability" reasons... not the "technical" reliability of the signal going through autopatches, around mountains, etc, but the reliability of the *message itself*...

>Whats the matter, would she lie to me?

No, but *you* may... unwillingly, of course... :*>

Like <zaphod.mps.ohio-state.edu!mips!wyse!stevew@tut.cis.ohio-state.edu>
(Steve Wilson x2580 dept303) writes on 25 Jul 90:

>Now that may cast into question the entire effort we exert with
>an admission that it's possible to get inaccurate information.

...and all the discussion that went on a few days back on the "accuracy" issue.

On a last note: how come I'm getting *my* posting AND a reply to it IN THE SAME DIGEST..? Do certain groups get special delivery..? Any comment, Brian?

RTTY DX Notes, 1of3, 7/27/90

RTTY DX Notes for Weekending 27th June 1990.
Part 1 of 3.
BID: $RTDX0727

One wonders at times about the accuracy of the propagation reports.
It seems that WWV gives a letter that says the bands will be fair to
good, W1AW reports that the bands will be good this week, but by the
looks of the bands, everyone has gone out to play golf or tennis or
something, because there have been very few stations on the air in the
past week. Or maybe they have been checking their gear for the next
contest.

Our information this week came from F8XT, I5FLN, I5ICY, I5IGQ, JA1BLV,
OD5NG, SM5EIT, TG9VT, VK2EG, W2JGR and the Tri-State DX Association
VHF packet cluster. Thank you all for your help.

RTTY DX Notes for Weekending 27th June 1990.
Part 3 of 3.
BID: $RTDX0729

QSL Information.

VQ9RB is Dick Barnes, Box 55, NSF, FPO. SF, CA 96685-2000 U.S.A.

UA1OJ/UA9Q is at Box 27, Severodvinsk, 164500 USSR.

ZL0AIC will QSL via HB9AAA.

9L1US will QSL via WA8JOC.

5V7DP says to QSL via KA1DE.

J39BS will QSL to WB2LCH, not WB2CLH as stated last week. Sorry Erik.

RC8P/UB4MZG says to QSL to Box 22, Schastie, 348903 Ukraine USSR.

PZ1BS QSL to Box 813, Paramaribo, Surinam.

UA4FDS to Box 555, Penza 440061 USSR.

Notes Of Interest.

DA1WA will operate from Frankenstein's Castle from August 4th to 5th.

6W6JX will operate from C53 August 9th to 23rd with the call of
C53/6W6JX. QSL via his normal path of F6FNU.

JH4IFF will sign VP2V/JH4IFF from around the 10th of August.

DF2UU is expected to operate from (TF) Iceland in August.

JA3DLE/1 worked FT1MM on July 22nd. Has anyone any information on
this station? I can't find any information here.

The Malpelo operation scheduled for January 1991 has been moved
forward to November 22nd this year. But they still need antennae and
transceivers for RTTY. Can anyone help? If so, Telex 033413
Barabquila Colombia. Financial assistance is also needed and can be
sent to: HK3BED, Box 584, Bogota, Colombia.

ZL0AIC is on Ross Island in the Antarctic, and works with/for the
Greenpeace people.

I2KYM/IG9 is an IOTA station. Reference AF33, Zone 19.

GL DE DX1.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips
to VK2SG @ VK2AGE.AUS.AU, or via AMTOR on the VK2AGE APLINK mailbox.

SB ALL @ RTTYDX $KT7H0726

World Radiosport Aftermath

BID: $KT7H0726

It's been quite a week in Seattle! We just hosted the World Radiosport Team Championship, which is the first time ever that a radio contest was held with all of the participants in the same area.

Next week I will be sending out a summary of the scores and some "war stories" from the crew that hosted the contest and the teams. I attended a couple of the social events, but could not participate fully because of my involvement in War and Peace, an opera production of the Goodwill Games Arts Festival.

I was very impressed by the group that put on the contest, the volunteers who helped host the foreign guests, and the operators from around the world. The parties and the comraderie were great! I was most impressed with the Soviets. . .a real fun bunch of guys, some of them excellent English speakers, and do they know how to drink vodka!

More news next week.

73,
Tad

4731. Re: R7000 Trap for Broadcast FM

Newsgroup: rec.ham-radio
Date: 1990-07-29 15:55:30 UTC
From: john@anasaz.UUCP
Message-ID: <2789@anasaz.UUCP>
Source record: 9737
Cross-posted to: rec.ham-radio,rec.radio.shortwave

In article <3607@radio.oakhill.UUCP> charlie@oakhill.UUCP (Charlie Thompson) writes:
]used Pspice to simulate the response from filters
]designed using ECD. Normally you can expect
]about ~6dB of insertion loss; a gasfet preamp after
]the filter can make up for this. In summary the R7000
]can get overloaded from strong signals like FM stations.

A couple of comments here:
(1) the preamp AFTER the filter will have no beneficial effect at all
on a well designed receiver such as an R7000. Any good receiver has
more than enough gain - the enemy is noise, ie you want a good noise
figure. A 6dB insertion loss filter will add 6dB to your noise
figure, pre-amp or not! Once you have lost the SNR, you can never
improve it again.
(2) It is quite possible to design filters with very low insertion loss
(<.5 dB for example) to do what you want. However, the lower the insertion
loss, the higher Q elements you need. At 100MHz that shouldn't be
much of a problem. See the Reference Data for Radio Engineers for
design data (although it takes a lot of fiddling with the way the
data is presented in order to convert it from analysis to design
data). I'm sure there are other references. The calculations are
easy enough that you definitely don't need a computer to do them.
Any decent library should have the book. Possibly the Amateur Radio
Handbook has it also, but I haven't checked.
(3) The Radio Shack filter is likely to beat anything you can do yourself
unless you work hard at it and have the equipment to really measure
the filter performance (preferably a sweep generator or tracking
generator/spectrum analyzer). At a minimum, you need a signal
generator with flat output over the 75 - 130 MHz frequency range,
and some sort of good RF signal level detector (properly done,
a diode detector and a volt meter, and a calibration curve to get
dB's from it.
(4) If you build the filter, keep in mind that component characteristics
(using the right type of capacitor and inductor), component placement,
and grounding and shielding is going to significantly affect the
results. Use the right parts, LOTS of ground plane, high Q coils,
good capacitors, and appropriate shielding.

>
> Dave N4DJS

There may be several reasons:
1. No desire to work VHF.
2. lack of time to study (or memorize) due to other commitments.
3. travel difficulties to exam sites for upgrading (one could live in a remote
area, or be too young or otherwise unable to drive).
4. A desire to try ham radio for a while before deciding to stay in it.
Remember, entry-level licenses are there to give people a chance to try
ham radio out without having to take so many exams.
5. Only purpose of license is to communicate with spouse on 220 MHz repeater.

There may be others. When I had my Novice (1972-74) I was too young to
drive and had difficulty getting from Fayetteville NC to Norfolk VA.
As a result I was unlicensed for almost a year after my Novice expired.
This was not my choice but a consequence of NON-RENEWABLE licenses, which
I oppose.

Fortunately most VEC exams are held more frequently and are more geographically
distributed than the FCC exams were; but there are some parts of the country
where it is difficult to find a place to take an exam.
There are others where it is very easy. Within a 100 mile radius of
Charlotte there is an exam given about 3 out of 4 weekends. So that reason
would not apply here.

]>either fast frequency hop or direct sequence.
]>
]
]In our 100,000 watt TV transmitter, the sideband filter is a little
]SAW filter you can hold in the palm of your hand. In our old 50,000
]watt transmitter the filter was a huge water cooled monster on the
]output of the transmitter. The SAW filter is installed just after
]the modulator at the 100 miliwatt level. Assuming reasonable
]linearity (<2%) in the following power amplifiers, this little guy
]can do the job nicely. Assuming your PA doesn't act as a wideband
]noise generator on it's own, you don't need huge cavities anymore.
]Transmitter and filter design have changed dramatically in the last
]ten years. Nobody does "high level" modulation anymore and achieving
]linear power is much easier than it used to be. Amateur technology
]has a long way to come from the old Micor to the modern world.

Point well taken. However, your 100,000 watt TV transmitter is not
protecting sensitive receives just outside the passband. How much
are your sidebands reduced? 60 dB? That's just not enough for
the case we are talking about. 2% linearity is nowhere near
good enough - I'll bet your linearity is much better than that.

Remember, when we talk 100dB range attenuation, we are getting
into tough stuff. Your SAW probably leaks more than that - what is
the passband vs. stopband attenuation of it? Add to that nonlinearities,
AND wideband noise, and you may still have a problem if you are operating
in the amateur 440 band (or 2 meter) and trying to protect other services
in the 450 band (or 150). Finally, one reason for pass cavities is
that transistor amplifiers do radiate significant broadband noise, even
if unmodulated. When we put a pass cavity on an FM repeater, we lower
the site noise significantly. Leaving out that protection means that
the broadband noise is a problem. Of course, I guess we could use
tubes...

W1GG Retransmission

DX Bulletin 30 ARLD030
From ARRL Headquarters
Newington CT July 27, 1990
To all Radio Amateurs

Thanks to Paul, KB1BE, and the Connecticut DX Association for the following DX information.

YEMEN, 7O. Pierre, F6HIZ, has announced that F2VX and F6EXV will operate from Aden from July 28 to August 12. They have been issued documentation from the Minister of Communication, Republic of Yemen. The calls used will probably be 7O1AB and 7O1AC.

Check 5 KHz up from the bottom of the bands for CW, with the exception of no CW operating on 80 meters. Check 3787, 7065, 14125, 14145, 14195, 21195, 21295, 28445 and 28495 KHz for SSB. They will announce the split listening frequencies.

THAILAND, HS. Members of the Japan UNICEF Ham Club will activate HS0ILY July 27 and 28. Operations will be on 80 through 6 meters, CW and SSB. QSL via JA2BCQ.

MARKET REEF, OJ0. Callsigns for the Market Reef dxpedition scheduled to start July 28 will be OJ0/KF7PO on SSB and OJ0/N7BG on CW. QSL via KF7PO.

CRETE, J4. A group of Greek operators will sign J49G from Gavdhos Island starting August 1. This two week operation will be on CW, SSB and teletype modes. The island is located just off the southern coast of Crete.

SVALBARD, JW. A Netherland dxpediton to Svalbard by JW/PA3CDO, JW/PA3FMK and JW/PE1MIS will be active from July 27 until August 8. Activity is planned for 80 through 6 meter CW and SSB. QSL to each operator's home address.

NORTH COOK ISLANDS. Look for Kiyoko to sign ZK1XH from North Cook. She has been using ZK1BY from Raratonga.
NNNN

> In any case, I want to get a 2m/440 or 2m/220 radio. The first problem is
> 220 vs 440 ? It seems that you can't have everything. Any advice on that ?

Find a Drake UV-3 at a hamfest or in the Yellow Sheets. It has the capability of 144, 220, 440 all in one not so small radio. It has four diode programmable memory channels for each band, and its VFO is not confined to the standard channel spacing for each band as some of the newer radios are.

This is the kind of radio with which you could be comfortable for multiband packet operation; you certainly wouldn't miss it mobile, it's too big!

Just a thought.

The best way to get started IMHO is to find an amateur or amateurs in your area who teach classes for new hams. One way to find out if there are any is to write to the American Radio Relay League, 225 Main St., Newington, CT 06111 and ask for their Prospective Ham Package. It will list clubs and local hams who are willing to help newcomers and who gives tests locally. Another source is your local Radio Shack. They might know some local hams, but even if they don't their Novice Course for $19.95 will give you all the information you need to pass the test. It even includes 2 morse code practice cassette tapes. I used their courses to pass both my Novice and Technician tests. I also passed the General written test using their course. All I need now is to practice my morse code. Good luck and hope to talk to you on the air soon!

<PLB%PSUARCH.BITNET@CORNELLC.cit.cornell.edu>
"P Bandini, PSU Arch Dept, 814/863-0062" writes:
>Frankly, I don't have hard facts. That would require survey, data analysis,
>etc, and all it would provide is confirmation of a basic truth that we
>already know about: there is no free lunch. Anything that is in limited
>supply does cost (land, water, spectrum...)

A logical statement can be made about supply and demand. Cell sites are
built to "supply" a service. There is a certain amount of overhead cost
that is required to do this. It is NOT a trivial amount. A business
person in cellular or land mobile service does NOT design his system to
meet emergency or overload conditions. If he or she did, it would reduce
profit by the requirement of higher equipment installation and maintenance
costs that would be used only rarely. Even if someone DID consider it, they
realize that in such an emergency, there are going to be other choke-points
such as the Telco switch itself. It is just not logical (profit-wise) to
do so.

>Lately we've been hearing a lot about how saturated landline phones AND cell
>phones become in case of an emergency. A gut reaction is "if they had more
>channels, the saturation threshold would be higher, right?"

Let us say that this is true. You would pay DEARLY for the cost it would
take to implement this. You would be paying for peak demand versus average
demand and the normal customer would not tolerate the additional costs. Most
especially so if even with the additional capacity of the cells, the call
could not be completed due to overload of the Telco switch. I.E. You would
be paying more for the privilege of hearing a busy signal from the Telco.

A much more logical method is to use the existing bandwidth more efficiently
rather than just adding more channels (which means more equipment, which
means more maintenance, which adds up to more $$$) This is why the "digital"
radios are being pushed! In addition, when this happens... the customers
will all have to go out and buy NEW radios... (maybe not all at once but
eventually) this is called "planned obsolescence" and is a favorite revenue
producing trick. Ask some of your Motorola dealers sometime what they do
with old radios that are "traded in" on newer models. In many MANY cases,
the dealers are told to SCRAP the old radios. Not give them to hams, or sell
them on the side.. just SCRAP them. Reason? Motorola no longer has to stock
spare parts support for the older models and thus can reduce their parts
overhead.

>Also, more channels = more customers = lower cost per customer, right?
>(At least, that's what has happened for just about anything I can think of)

Up to a POINT that is true. There is a balance ratio between number of cells versus number of users. That exact balance equates to the maximum profit. Deviate from it either way and you will start losing money. It is logical for the cell system operator to overload his system rather than underload it by design. It is a safer practice and is more likely to generate a consistent income. Always remember.. the purpose of cellular telephone is to MAKE MONEY. Every decision that they make is based on that premise.

>So, since we are not really arguing about this basic truth, the question
>could be "Am I willing to pay for your 'service' through a higher cell phone
>bill?" I might, but then we'd have to enter a less ambiguous contract: how
>do I access your 'service'? where do I find you when I need you? can you
>guarantee the accuracy of your 'service'?

Exactly! Would you enter a contract where the cell operator says "I will provide you with a 95% guarantee that I will get you to a Telco switch and in order to do that it will cost you $xx.xx amount more... but after that there are no promises!"? Maybe YOU would, but the average person would not, at least that is the general thought of the cell operators. Plus, keep in mind... THEIR profit margin. If they think that adding this capability would enhance their PR and bring in more customers, then they might do it. Logic says that it would be a bad risk unless there are a LOT of emergencies to keep this thought uppermost in the customers mind.

(sorry, but "your cousin in SF is ok" just won't do... when I *hear* her
>voice I will *know* she's ok...)

I would suggest then that the best solution for you and your cousin is for you both to become Amateur Operators.

>I would like to extend my sympathies to all volunteers of all kind, whether
>it be driving an ambulance, or preparing hot food in a shelter. I hope these
>comments will not be interpreted as an attempt to minimize their (in)valuable
>contributions.

I have to admit that it appeared to me that your comments just might be trivializing the importance and amount of service provided by Amateur operators during major emergencies and that you feel that such services could be better served by releasing the spectrum to commercial interests.

With this thought in mind, I have to say that you are more than likely always going to get the best EMERGENCY service from Amateur Radio simply because they are not profit motivated and are willing to switch their spectrum from hobby use to total emergency service on a moments notice. Commercial service operators are just that.... commercially motivated. They will ALWAYS plan a system with the maximum profit in mind and not "once in a blue moon" emergency conditions. If they can do the second while not affecting the first, they will. Otherwise, I would not care to count on it.

>However, I'm wondering if in the case of emergency communications, ham
>radio is the *best* we can have... comments anyone?

Absolutely NOT! In the case of emergency communications, there are a LOT of better methods than "Amateur Radio". Military Satcom comes to mind where a small radio and little fold out dish (about 1 foot by 1 foot) can be made operational in a matter of minutes, can talk across the continent or across the street, and can be made secure in a few seconds AND can be used by most any halfway trained operator. This is just one example but there are many MANY more! Ham radio in no way represents the *best* of theoretically possible communications methods. But it *IS* usually available first and can inherently handle a higher volume of trivial traffic than can the "designed for emergency" systems. You have to realize that whether or not your "cousin is ok" is a VERY TRIVIAL matter in the total scope of emergency communications. If there is enough depth available to handle such messages, that's great.. but in major emergencies Amateur Radio has time and time again been initially utilized as THE ONLY communication available at the disaster site. Once better methods are in place to handle the REALLY important traffic, ham radio can be released to handle secondary (trivial) traffic such as health and welfare.

Please understand, I realize that knowing whether people are dead or alive is a very important thing TO YOU. But if you don't know about this person, he or she will survive and so will you. Matters concerning medical supplies for the dying, potable water and drugs to prevent major outbreaks of infectious diseases and the local coordination of emergency recovery services take implicit priority over the status of relatives.

Ham radio provides the very necessary DEPTH, and sometimes is the ONLY communication for these matters. As such it is well worth keeping the spectrum for, would you not agree?

Theoretically, the costs should be lower. However, I highly doubt it. One reason is greed. Why should the cellular companies lower their prices? They've got a great deal. And with more channels they rake in more profit. The 'public' doesn't need to know where the channels came from. Come to think of it, they (the cellular companies) might even advertise... "Use our company, Cell 2000. We have many more channels whyich you can use for only the base cost plus a slight nominal charge." Indeed, the cost *might* go *up*. Perceived value...

Just which frequencies should these new channels come from? Regardless where they come from, new antennas will need to be installed (assuming they come from the ham bands). The current antennas wouldn't be tuned to the new frequencies.

As quoted from <9007290222.AA01282@tecnet1.jcte.jcs.mil> by mgb@TECNET1.JCTE.JCS.MIL:
+---------------
| >And I don't understand the need to test for a mode that is not commonly
| >used on the frequencies granted by the license.
|
| If the licensed person is granted the privilege to operate this mode, then
| it holds true that some basic understanding of the mode should be tested
| for. The fact that it is not commonly used RIGHT NOW should not detract
| from that. The only way to do it otherwise is to test someone only on
| what they are interested in. Then what? Do they get access to "those
| other modes" by default, or are they withheld?
+---------------

Show me the Novice questions on packet that weren't on the test I took.
Novices are allowed to work packet on 220, after all, and even have a specific
waiver of the repeater license class minitation for digipeaters.

Of course, all this proves is that the tests aren't particularly consistent....

The people who have commented here seem to have forgotten the possibility of interfernce from SS to weak-signal ham activities. W1EJ tells me that he calculated the increase in noise floor from a 440 MHz SS rig he saw advertised.... the increase was 3 dB at a free-space distance of 50 miles from the one-watt rig when something like twice the bit rate away. The rig had little RF filtering, but the key point is that the EME activities would have been clobbered even with many 10s of dB better filtering, if the distance was a few miles. We're talking about 100-150 dB supression of the redundant outer sidebands. Low level filtering can make it cheaper, but the linearity requirements are severe and will still call for good filtering after the final amp.

Or so he says.

> terminals.

And I thought that I was the only person to notice that the two
halves of the schematic did not make sense when connected.

Now, who noticed that the microcode (Assembly Code Listing) was NOT
available from the ARRL! Between the incorrect schematic AND the
lack of a program listing for the microprocessor there is little
chance of successfully constructing the project without purchasing
the kit from the author.

I understand the lack of space in the magazine to print the listing,
but it should be available to those who request it. Otherwise I feel the
article is nothing more than a subtle advertisement for a high priced
charger.

Question:
Could the same effect (that of turning off the high current
charge rate once a voltage peak is detected) be accomplished
in an analog circuit?

Answer: YES!

If you used an op-amp, fed both inputs through long time
constant integrators from the NiCads. Make one of the time
constants 3-4 times the length of the other. Then, the output
would change state after the voltage "peak" of the charged NiCad
occurs. Use an SCR (or a flip/flop) to switch the charge rate
to a trickle rate. Yes, I know it isn't as sexy as a
microprocessor controlled charger, but, it would probably
work just fine. I'll probably breadboard one to give it
a try.

From: dale@crg2.uucp
Message-ID: <39594@sequent.UUCP>
Source record: 9752

I picked up a used 2 Meter rig with no manual.
It is a SANTEC ST-20T. Mostly a clone of my ICOM 02AT and I
can set frequency and repeter offset, but don't know how to
program for subtones, or even set the clock. Wouldn't think
that would be to hard, but I haven't figured it out yet.

If anyone has one of these and can copy the manual I sure
would appreciate it. Send me e-mail, uunet!sequent!dale is
a good path. I have been on vacation for three weeks with one
more to go so I'm not reading the net or mail regularly.

Thanks to the responses for my request for the TS-430S manual.
I got one, have some thank you mail to send out for the other
responses on that request, time away from computer has interfered
with that.

While I'll be the last to say that PL is a bad idea, I have to say that
it's not the panacea that many have held it out to be. You can't change
the laws of radio - especially such things as heterodynes and capture
effects - with a PL encoder.

Easy question. They apply to all hams who are Extras. One of the privileges
of being an Extra is permission to operate from space. (Does the Shuttle count
as a DXCC country?) Thus you are prepared for questions on these new privs
in the study guide for Extra.

The confusion lies in that you should be looking in books describing microstrip inductors rather than stripline inductors. I would not say that you are more likely to see a microstrip circuit in "real life" than a stripline. In general it is easier to fabricate a microstrip line than a stripline circuit but microstrip suffers from dispersion since some of the field lines travel in the slow dielectric and some in the

faster air. So depending on your application one may offer advantages over the other.

You could try "Microstrip Lines & Slotlines" by K.C. Gupta et al.

You could also look-up back issues of "RF design" magazine. There was an article that gave all the relevent equations, which appeared about 2 years ago.

>UTC over South Africa. ZS6AKV and stations in Zimbabwe heard DOVE sending
>ASCII telemetry for 2.5 minutes and then stop for half a minute, and then
>repeat this cycle again and again. At the present time DOVE's RF output power

I listened to the AMSAT net this past Sunday (7/29). It seems that after
3 days on the air, DOVE has shut down again. Apparently, though, this time
it is due to 'pilot error'. N4HY got DOVE working just before leaving
for a conference in England, and passed babysitting responsibilities on
to someone else while he was gone. DOVE has a 3-day watchdog timer in it
that will shut down the 2m transmitter if a certain command is not received
from the ground on a regular basis. Since there was some confusion about
what command that was, apparently this timer has timed out. The bulletin
predicts resumption of transmissions after N4HY returns sometime this week.

4755. Engineering help solicited: low-pass audio filter for the HTX-100 10 m SSB XCVR

Newsgroup: rec.ham-radio
Date: 1990-07-30 16:41:34 UTC
From: Eric_Rawson.PARC@XEROX.COM
Message-ID: <900730-094140-10059@Xerox>
Source record: 9761

The Realistic HTX-100 25 watt 10 meter SSB rig is pretty satisfactory in many ways. It offers a cost effective way to get on 10 SSB mobile, and gives a small saving compared to the fuller functioned Uniden unit from which it is derived. In my car with a quarter wave whip I work Japan, Australia, and New Zealand regularly from CA while commuting.

However, I have noted one flaw that bugs me; the receiver bandwidth is too broad. With weak signals there is far more static white noise crashing in the background at high audio frequencies than is necessary. Its so bad, in fact, that I can often improve intelligiblilty (in marginal conditions) by switching to CW mode, where the bandwidth is probably less than 1 kHz. Sure, this cuts down on the audio BW to less than the 3 kHz or so which most would say is near optimal for SSB audio, but it also cuts down on the static noise background even more, for a net gain. This says to me that the SSB mode audio BW is larger than optimal (for weak signals).

I suppose the ideal fix would be to use a narrower IF bandpass, but that too complex a mod. How about instead a simple mod which puts a low-pass audio filter in front of the final audio amplifier? Has anyone done this? I can imagine a small PC or perf board with an IC amp chip and a few R's and C's fitting inside the case somewhere, which rolls the audio off sharply above 3 kHz. Maybe it should have an on-off switch, so in strong signal conditions you could switch it off and have nicer audio.

IMHO, such a mod would make a very useful improvement to the HTX-100. Probably, such a mod would be usable in the Uniden "parent" unit as well.

Anybody interested in engineering such a mod, and passing on the details? Alternatively, if someone can design it but doesn't want to build it, I'll do the layout, build it, and test it.

From: lwrclmr@sacemnet.af.mil
Message-ID: <9008012038.AA14291@ucsd.edu>
Source record: 9763

OK Folks,

Here's an interesting one for you antenna experts. I recently put a couple of HF antennas on my van. I used Radio Shack mirror mounts, springs, and Hustler's new MO-4 masts. I have five bands worth of resonators, all with excellent results EXCEPT 20 meters. If the whip is too short and resonates above 14.45 or so, I can get a good bandwidth and almost 1:1 SWR. Same thing below 14.00. In fact I can get a good 175 or so kHz almost 1:1 bandwidth from around 13.10 to 15.00 by adjusting the whip EXCEPT for 14.00-14.45, where I cannot get it below about 2.5:1! I have used both mounts, changed coax, springs on and off, moved/removed other antennas on the vehicle, done everything except exchange the resonator. All other bands work great. I can put my tuner in line and bring it down, but I would like to get by without the tuner. The radio I am using is an ICOM IC-720A.

If anyone has any suggestions, I would be most appreciative. Please e-mail or post, preferably both. I have tried just operating with the high SWR, but no one seems to hear me. There is no noticable drop in output power per the meter like I get with a really bad SWR, but in checking with other stations, there is a significant difference with the tuner in than out.

Thanks for any help any one may provide.

73,
Michael WA7SKG

Subject: Re: Has anyone made any homemade valves...

When I was in undergrad school, EE, the department acquired a prof. who specialized in transistor construction. So the theory was each student would take a lab from him to build a transistor that would be used for all the remaining labs. Working transistors were generally not available at that time. We made junction transistors I believe. Details are quite difficult to remember. Anyway, they had to bake for several days at some outrageous tempreature. Seems that the janitor found the oven on and unplugged it - there was a rule that nothing could be left on at night. No amount of persuasion from the Dean ever solved that problem. As a result, most of the units were DOA. Mine must have been close to the center of the oven. It produced an amplified sine wave for close to a minute before going up in smoke. Our attempts at determining power dissipation were not very good. At least one of the units still worked at the end of the semester.

I hate to say it, but I think that the 'professionals' will keep their 'professionalism' where the money is. I think its too bad that we've proceeded to the point where ham technology is a few years behind commercial technology as opposed to commercial being behind hams. Realistically, I don't think hams are going to do the custom chip fabrication and so on needed to build these "cellular" systems. I know we could just use their technology directly, but then, just go buy a cell phone.

Hams do, however, have one thing over commercial technology. We are not market driven. This leavs a lot of room to try out unique, or even bizarre ideas which could be very useful in the future. There is no way commercial interests would put a lot of money into some of the projects that I've seen people come up with, but a lot of them are very good ideas.(I like the baloon launches myself). These creative ideas do not necessarily need people trained in professional engineering, and in most cases, this professional training impeeds things(you have to unlearn what they teach you to be creative).

Anyway, that's my liberal thought for the day.

>--
>John Moore HAM:NJ7E/CAP:T-Bird 381 {ames!ncar!noao!asuvax,mcdphx}!anasaz!john

My point was perhaps misunderstood. If the receiver is suffering from intermod/overload it is better to first filter (even at a loss) and then to amplify. If you don't do this then the large signals will MIX IN THE PREAMP and you'll have intermod city. Noise figure is a secondary concern if your receiver is wigged out by a 50KW FM broadcast transmitter. I live 4 blocks from a behemoth FM station. FET amps are only linear for small signal levels so if you drive a 200 mV signal into a FET preamp you are likely to get mix products with other signals as well as harmonics.

Low-loss passive filters would be the best way deal with the filter-before pre-amp problem.

> NICAD CELL CHARACTERISTICS

I read this and none of it disagreed with what I've learned from my friend and the Sanyo and GE books. Of course when you have cells in a battery pack, it is unfortunately difficult to do anything with or to the individual cells.

"Wouldn't it be nice if" all battery packs had a standard connector that had two pins for each cell? To use the pack you'd attach a "series" connector. To charge the cells you'd use a "parallel" connector (with sufficient smarts in the charger to do the job right of charging and checking each cell).

>of being an Extra is permission to operate from space.

Great. So I pass my exam, then write NASA that I want to operate from the
shuttle? These rules don't apply to all extras, only the those with the
means to launch a sattelite or get a ride on the shuttle. That is very
few even compared with modes that most would consider pretty esoteric,
like moonbounce.

I have also heard of astronauts without extra tickets being granted
temporary priveledges for the duration of a flight. If that is
routine procedure, then being an extra seems to have little to do with
it.

Here is a more down-to-earth example. To get a ticket you have to pass
various exam elements with designations like 3e, 4a, etc. In a sense,
this affects every new ham. Once you get your license, those designators
have zero effect on whether you will operate your station legally.

Supposedly the reason for the legal portion of the exam is to ensure
that you know the rules well enough to operate within the law. What
is the point of asking which designators are required for which class
license when there are practical questions that won't get in for lack
of room?

>channels, the saturation threshold would be higher, right?"
>Also, more channels = more customers = lower cost per customer, right?
>(At least, that's what has happened for just about anything I can think of)

...except telephone service. The marginal cost for adding an additional customer to an existing cell system is zero (and it's nearly zero for POTS). True, you ocassionally have to add another cell cite or MTSO, but that depends on the _stochastic_ nature of the users, and not necessarily on the absolute numbers. For example, you need a lot more cells during drive times than at midnight...

What has gotten cheaper are the cellphones themselves, due to economy of scale (and the use of old technolgy - NFM). Digital cellphones initially will be more expensive, but economy of scale will drive them down as well; given the larger market, the potential exists for even greater mass production savings.

> If you used an op-amp, fed both inputs through long time
> work just fine. I'll probably breadboard one to give it
> a try.

In Wireless World (Nov 1983) was a design for a Fast NiCd charger
that alternately charged and discharged batteries and detected the
difference between the peak charge and discharge voltages.
It claimed to charge batteries in an hour or so.

"The charger to be described in this article relies on a
voltage-sensing method, but a rather different one. If a
moderately heavy charging current is applied to a NiCd cell
for a short period, the terminal voltage will quickly rise
to a level somewhat higher than the voltage marked on the
cell. Discharging the cell a little will reduce the terminal
voltage once more. A repeating cycle will produce a succession
of slowly rising 'peak' and 'trough' voltages, as shown in
Fig. 1 [Not shown here, sorry.].

"If the cycle is repeated for long enough (Fig. 2 [not shown]),
there will come a stage at which the peak voltage is increasing
much more steeply than the trough voltage. At this point the
cell is losing the ability to accept further charge and the
charger can be shut off. By measuring the trough voltage as a
fraction of the peak voltage it is possible to make an end-point
detector which works independently of the number of cells
under charge, since the proportions will be constant whether
there is just one cell or a dozen."

I haven't made one of these yet. Most of the parts substitutions are easily
determined (but does anyone know a replacement for a BYX71-600?).

Mostly I need to get "a round TUIT".

I have an Apple II Plus that isn't doing much except gathering dust.
I figure it could have a meaningful existance if it could contribute to
HAM radio.
Is anyone aware of:
Software for RTTY, CW, Packet, ...? Freeware, shareware, retailware?
BBS for Apple II's with emphasis on HAM radio?
Ways of using the cassette input and output port as a tone
modulator or demodulator?
Logging programs, direction finders, radio controllers, etc.?

Send replies via INFO-HAM or directly to my BITNET address: TJB@NISTCS2

Thanks in advance, Tom Buckley.

> it.

There has yet to be an American 'ham in space' with an Extra ticket. ALL of them have obtained waivers. Agreed, the rule is pretty silly.

Being one of the very few people who have actually helped prepare an application for space operation (as part of the early Pacsat work) I can say that I looked up the requirements in the rules. As I recall, there weren't any questions about space operation on my Extra test in 1973, and even if there were I wouldn't have relied on my memory.

Amateur exams have a problem shared with many other exams - they test one's ability to do rote recall rather than test one's ability to reason out solutions to problems. And nowhere is there more undiluted emphasis on rote recall than in the CODE test...

In the August issue of 73 magazine Wayne Green, W2NSD, writes a column "Solving the DXCC mess" about how DXCC is aversely affecting ham radio. I quote " . . . the amateurs [living in rarer countries] have been virtually forced off the air by DXers. DXers, driven by the 'need' for a QSL won't permit amateurs in rare countries to enjoy relaxed contacts." He goes on about international ill will caused by the agressive tactics of some DXers.

But surely these third world hams have the solution in their own hands, . . all they need do is to make it clear that they will QSL contacts made at the time, on the air, but will not send any cards out. The card collectors will soon lose interest in such stations and leave them free to those genuinely interested in DX (rather than awards) and/or ragchewing.

DOVE WATCHDOG TIMER TIMES OUT

HR AMSAT NEWS SERVICE BULLETIN 209.01 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

DOVE's Watchdog Timer Turns Off Two Meter Transmitter After Three Days

Last week the AMSAT News Service (ANS) reported that DOVE had come back to life sending its familiar AFSK ASCII packet telemetry on 145.825 MHz. For 3 days DOVE was heard all over the world until it became silent again on July 25th some time around 15:30 UTC. The speculation by Jim De Arras (WA4ONG) is that a pre-programmed software watchdog timer had expired and the DOVE on-board computer (OBC) had done what it was suppose to do: shut off the two meter transmitter. WA4ONG is DOVE's caretaker while N4HY and NK6K are out of the country attending the AMSAT-UK Colloquium at the University of Surrey July 27-30. The basic function of the watchdog timer is to tell DOVE's OBC "if you don't receive a valid command from the ground each day, then reset and give a safe-mode." Since N4HY got DOVE back on-line only hours before he was to leave for the University of Surrey in England, it appears there was some confusion as to what the proper command was that WA4ONG was suppose to send to update the watchdog timer daily. The default timer expiration was three days and it appears that DOVE did exactly what it was programmed to do, turn off the two meter transmitter after three days.

Because of the problem of the two meter transmitter transmitting while the DOVE's two meter receiver was listening for a ground command had been a major headaches last time, and it was necessary to use W5UN's gigantic EME station to get a reset command into DOVE's OBC, this watchdog was added by MICROSAT software engineers to prevent the two meter transmitter being on while the two meter receiver was looking for ground commands. DOVE listeners know that DOVE transmits for 2.5 minutes and then stops while its two meter receiver listens for 30 seconds. Basically, this timer tells DOVE that if "you don't hear a valid command from a ground station each day, then something is wrong. Go to a known state and wait patiently. But before you get there, turn off your two meter transmitter and be prepared to do an OBC reset command."

Next week both N4HY and NK6K will return from Surrey and the first order of business will be to go over all the diagnostic memory dumps to be sure it was indeed the watchdog that timed out. AMSAT-NA asks hams all over the world to please be patient once more as DOVE will surely return to two meters soon.

When DOVE resumes two meter transmissions, it is an indication that battery management is once again under OBC control and it is important to characterize battery behavior for several days thereafter. Amateurs

worldwide are requested to collect DOVE telemetry and send it on diskette to the AMSAT-NA Telemetry Archive managed by Reid Bristor, WA4UPD, 4535 Deerwood Trail, Melbourne, Florida, 32935, U.S.A.

WO-18 VIEWS TOTAL ECLIPSE

HR AMSAT NEWS SERVICE BULLETIN 209.02 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT passed through a total solar eclipse which occurred on 22 July 90 from 0152 to 0412 UTC at about 0243 UTC. Whole orbit type data and pictures were taken during the event in which it is thought that the satellite passed through both penumbra and umbra of the moon's shadow. These data are being transmitted in the WEBERSAT data stream for several days so that interested users will have ample opportunity to collect it.

WEBERSAT controllers are very pleased with the results; solar array currents measured during the eclipse period do indeed show measurable reductions at the expected times.

Further information on this particularly interesting WEBERSAT event will appear later in ANS and AMSAT publications.

SP SAT ACTIVITY FM ZIMBABWE

HR AMSAT NEWS SERVICE BULLETIN 209.03 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

Four Special Callsign Stations to be Heard on AO-10 and AO-13

OSCAR enthusiasts from Zimbabwe have organized a special satellite activity month celebrating "1990: THE YEAR OF THE AMATEUR SATELLITE". Z21HJ/R and Z21GH along with the active support of the Zimbabwe Amateur Radio Society are sponsoring four separate satellite stations operating from four different locations around Zimbabwe. These stations have been issued the call-signs: Z21SAT, Z22SAT, Z23SAT and Z24SAT (prefix hunters should find some interest in these calls). It is expected that the stations can be found on Mode B around the frequency of 145.905 MHz on AO-10 as well as on AO-13.

The stations will be activated over the weekends of 31 Aug through 30 Sept 1990. Special QSL cards will be available for each of the four stations. ANS has been informed that QSLs will be sent either via the bureau or if a speedier reply is desired, the standard DX-QSL protocol of including an IRC will hasten the card reciprocation.

In addition to the special QSL cards, those stations who have worked at least two of the four call signs will qualify for the "ZIMBABWE SATELLITE ACHIEVEMENT AWARD 1990". This beautiful award is based on African culture and shows the famous Victoria Falls in the background. The award will be

available for a nominal donation. Further information on QSLing and the award should be available from the stations during the operation.

YET ANOTHER AO13 ORBIT STUDY

HR AMSAT NEWS SERVICE BULLETIN 209.04 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

Goddard Space Flight Center Experts Study AO-13's Perigee Decay

Tom Clark (W3IWI) and a fellow orbital dynamics expert, Erricos Pavlis of the the Goddard Space Flight Center in Greenbelt, MD have just concluded an in-depth and highly detailed study of AO-13's orbital decay situation. Both Tom and Erricos will present the results of their study in a paper to the AMSAT-NA Space Symposium later this year. While the purpose of this ANS bulletin is not to present the results of their combined efforts in great detail, some of the more outstanding points need to be mentioned to stop needless rumors.

Firstly, AO-13's perigee has been steadily decreasing at a rate of 785 meters/orbit. This was gleaned from studying orbital element sets from the day after AO-13's apogee kick motor was fired almost two years ago. Using a simple procedure of linear extrapolation of the perigee altitude from orbital elements, one would be inclined to predict a orbital re-entry of AO-13 around early 1992. However, life is not that simple. Orbital mechanics is capable of throwing the unwary analyst a celestial curve-ball. Using an extremely sophisticated orbital ephemeris program which includes the effects of everything and the "kitchen sink," and running this program on a large mainframe computer, the results indicate that a simple linear extrapolation technique can not always produce accurate results when it comes to orbital decay. W3IWI's and Erricos's efforts from this huge program show that AO-13's perigee will continue to collapse from the present 1500 KM altitude now to a minimum of 600 KM by 1992. Throughout that year, AO-13's perigee will wander around from 580 to 650 KM. And then just when you thought it would continue to decay, AO-13's perigee will then start to rise again! It will rise to 800 KM by late 1993, and then start to decay again! After staying around 800 KM for awhile, AO-13's perigee will then start to decrease again and a predicted re-entry MIGHT occur around late 1996 or early 1997.

But in all of this, W3IWI asks that hams keep in mind that "the collective effects of gravity of the earth, sun, moon and planets on a highly elliptical satellite do not constitute a neat, simple predictive system -- it is in fact a classic chaotic system ...dependent on the initial conditions." The complete results of this detailed study will be presented in Houston, TX at the Johnson Space Flight Center (JSFC) on Oct. 20th when the JSFC ARC, W5RRR, will host the annual gathering of AMSAT's finest.

RUDAK-2/RS-14 LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 209.05 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

RUDAK-2/RS-14 Launch To Be Delayed Until Autumn

The AMSAT News Service (ANS) has received information from a reliable source that the launch of RUDAK-2/RS-14 has been delayed until Autumn. This delay is due to a hardware failure in the primary payload. The primary payload is a Soviet oceanographic research satellite known as GEOS and RUDAK-2 is riding "piggy-back." In addition to being a packet radio BBS, RUDAK-2 will also contain a Mode B linear transponder. The RUDAK-2 transponder was designed and built by AMSAT-DL and delivered to representatives of AMSAT-U-ORBITA in Munich on January 21, 1990. Accepting the RUDAK-2 transponder on behalf of the AMSAT-U-ORBITA was Leo Labutin (UA3CR) and Dr. Alexander Tenyakchev (UW3CZ).

Originally planned to be launched in June of 1990 on a PROTON rocket from the Pletetsk spaceport, RUDAK-2 is intended for a circular orbit with an altitude of 1000 KM and an orbital inclination of 98 degrees. AMSAT-NA will release further information concerning the launch date of RUDAK-2/RS-14 as soon as it is available.

SB ALL @ AMSAT $ANS-209.07
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 209.07 FROM AMSAT HQ
SILVER SPRING, MD JULY 28, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on July 3.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 190
Mode-LS : MA 190 to MA 195 (Mode S Beacon only)
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 240
Off : MA 240 to MA 003
Omni Antennas : MA 240 to MA 060

Cross mode B and S QSOs are possible from MA 200 to 205.

The current attitude estimate:

BLON = 207 and BLAT = +1

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

Much activity has been heard on AO-10 centering around a popular calling frequency of 145.910 MHz.

I've never seen it at a VE session either, however, Rich, you do know someone who passed his 20wpm that way (3 times, in fact since the FCC didn't issue CSCE's for code credit).

That someone was me. The FCC gave no credit for solid copy at that time, however. You either passed the fill-in-the-blank test or you didn't get code credit. I would not recommend that procedure now that one can pass the exam on solid copy as well as the 10 question test.

Agreed. It is of dubious value to have these questions on the Extra
exam, even if they are "privileges" of holding such a license.

>I have also heard of astronauts without extra tickets being granted
>temporary priveledges for the duration of a flight. If that is

As far as I know NO ONE with a lower class license has ever been turned
down when requesting a waiver to operate from space. I don't think that
an Extra has done so yet.

>

>
>-don perley
>perley@trub.crd.ge.com

This is on the Extra class exam for a much more important reason. An
Extra class licensee is authorized to be a Volunteer Examiner-Coordinator
or may become accredited to be a Volunteer Examiner capable of giving
ANY Amateur Radio license exam. General and Advanced class licensees
are allowed to give specific elements only. Each VE should know which
elements are used for which license and know whether it is legal for them
to administer it. In practice I don't think this is as much of a problem

since I think VECs are reluctant to accredit anyone who does not have an Extra Class license (makes it easier when you don't have to worry about who may give what exam).

IMHO the VE accreditation procedure should require potential VEs to learn the element numbers, and not the operator license exams. There are not many more VECs than there are space travelers. But remember, the VECs maintain the question pool so I guess they don't want it that way!

4775. #Info Request for Ham HT's and Scanners

Newsgroup: rec.ham-radio
Date: 1990-07-31 04:44:15 UTC
From: wen@pro-sat.cts.com
Message-ID: <9007310442.AA09777@trout.nosc.mil>
Source record: 9681

I want to buy a HT for 2 and/or 1 1/4 mtrs with versatile scanning capablility and pl, etc. Unfortunately my present TEMPO fmh HT finally bit the dust. For all its faults, the battery pack lasted pretty well. Ability to access all types of repeaters and long battery life in the scanning modes are most important characteristics. Any recommendations from anyone pleased with the performance would be appreciated along with best liked and worst liked features and where they could be purchased/or prices would be helpful.

I also just bought the Radio Shack PRO-34 scanner, but am not particularly impressed with the operation and lack of a decent case may make a case for the exchange to a Bearcat 200 or just wait for the PRO-2005 to go on sale. I tried to contact Bob Parness, but have lost his net address to see if he had any recommendations on the scanner or the ht. Any assistance would be appreciated, particularly with regard to reviews, personal likes and dislikes, prices and mail order sources of supply.

4776. QST "Cover Stories" (or lack of)

Newsgroup: rec.ham-radio

Has anyone noticed that QST magazine covers often have very interesting covers but *NO* supporting cover story?

I noticed this especially then they had last year's decades of ham radio covers with some very interesting equipment on the covers but absolutely no story describing what was on the cover.

What's going on here, eh?

Source record: 9683

> "Wouldn't it be nice if" all battery packs had a standard connector that
> had two pins for each cell? To use the pack you'd attach a "series"
> connector. To charge the cells you'd use a "parallel" connector (with
> sufficient smarts in the charger to do the job right of charging and
> checking each cell).

You do not want to charge NiCd cells in parallel. You want constant
current to charge the cells, not constant voltage. Of course you CAN
charge each cell INDEPENDENTLY if you want.

If you are RAPID (or RABID) charging the pack, you need to stop when
some cells are topped off, but others may not be full yet.

If you charge cells slowly, you can leave all the cells on charge while
the latent ones are still filling up.

Also be wary of connecting cells in parallel in any application. If
one cell is FULL and another is EMPTY, such parallel connection could
result in a damaging level of current flow between the cells, and a
possible fire or explosion as a result of heat buildup.

Just adding more channels to cellular is NOT necessarily going to lower the costs of cellular service.

Consider the case of operating a seaside motel. You have a peak seasonal demand during the summer months, and some business during spring and fall. In the winter things are so bad, you shutdown. But during the peak of summer, you get more than TWICE the number of reservation requests you have to turn down. Would you expand your motel? Suppose the land next door is up for sale. Would you build and addition there?

This addition would be able to service the peak, but would do you no good during the slower spring and fall.

When things are up and down like that, it is not necessarily economical to acquire the resources to satisfy only the peak demands.

Cellular services have these same kinds of peak demands, but they occur at various times of the day. During times other than these peaks, adding more channels is NOT cost effective. While there are some fixed costs in the cellular business (tower and site rental/payments) there are also many incremental costs. To add more channels requires more equipment. There have to be more receivers, more transmitters, more computer interfaces, and more landline connections. For any given market there is a particular number of channels that are the most economically optimal. It isn't always easy to figure this out, but it generally won't meet all the peak demands.

The next question is whether or not this optimal number of channels is greater than the number available in the cellular service. It just so happens that the FCC as set aside some portions of the 800 Mhz land mobile band for undetermined purposes. While morst of these are starting to be taken up, cellular could get a few more slivers. I believe I have read that there is at least one petition to open up some more frequencies and establish a third provider in major markets.

I have been seeing ads in Chicago newspapers in the business sections for very low cost cellular phones. Typically the prices are $200 WITH a hookup and $500 without. They also seem to require the hookup be with a particular provider, so I am believing from this that they are trying hard to get more business. They must believe they are going to make more than $300 for each cellphone sale made, or else have an arrangement to not have to support so much of this discount in exchange for advertising the sellers wares through some other means. It's not clear just what is going on except for the fact that they are trying to get more business.

We've been hearing the problem is a patent issue.

However if it does turn out they delete the cellular frequencies then
I will certainly fuss, complain, and raise hell, and encourage everyone
else to do the same.

Remember, these frequencies are ALSO the 6th harmonic of 2 meters and
the 2nd harmonic of 435-445 Mhz.

During the AMSAT-UK satelite colloquium in Surrey, Great Britain, I saw
the ICOM R1 ready available. I forgot to write down the price, sorry.
Anyway, if someone comes over to the UK, you can get one there.
I believe it is also available in other European countries, but have
not checked. If you're going on a business trip..

Geert Jan

One company at least is selling the R1 for 399 pounds.

Did you know that the spec for the R1 in Germany only covers the
amateur bands? The R1 in France misses out the English VHF broadcast
band - about 97MHz to 108Mhz. I forget the exact frequency range; I
have the details at home and also, I believe, the full specs on the R1
and R100. I will look them up.

Reading the recent discussions on repeaters, PL-tone etc, i am puzzled at the whole idea of 'private' repeaters. Here in UK we do not have any such beasties; all our repeaters are 'public access' i.e. anyone who can put up half a second of 1750Hz tone has access to the repeater.
Repeaters are not operated by private individuals here; they are run and maintained by local repeater groups (who hold the license for repeater operation). We dont have that many repeaters either (there are only 7 channel pairs allocated in the 2 meter band for repeater use under our bandplan - remember us poor Europeans only have 144-146MHz)
I am only able to get three repeaters from my home QTH, there just arent any more!
This sometimes leads to congestion, but also leads to increased operating discipline and faster, less timewasting QSOs. It also removes any ghettoising of particular groups. My question is: Why does anyone want a 'private' repeater? IMHO a mixture of elitism and one-upmanship?
And *such* a poor use of spectrum-space!

Paul Flaherty comments that EME antennas are pointed above the horizon, thus he says that will reduce interference from SS stations.

My comment is that the first side lobe, say 15 to 30 degrees off the main beam, is usually down about 16 dB from the max gain. Other minor lobes may be down more or less from this number. Thus you can count on no more that another 16-20 dB of isolation from the SS station due to moon elevation. Many people work the moon when it is only a FEW degrees above the horizon. 15-20 dB doesn't make a big dent in the 100-150 dB that may well be needed.

Bob W3OTC

Source record: 9690

I had a similar problem to one recently discussed; i found a coaxial stub was the answer.
You will need: a 'T' connector for your coaxial feedline, plus a few feet of coax, and some suitable plugs.
Find out the frequency you want to cut off. Convert this to a wavelength (in metres) and divide by four to get the length for a quarter-wave.
Multiply this length by the velocity-factor of the coax you are using (get out your reference sheets, or look in the back of a Handbook).
Most solid-dielectric coax has a v.f. of about 0.66. Foam coax can be nearer 0.8 though, so check it BEFORE cutting!
Make up a length of cable with a plug on the end, to the calculated length. Short circuit the end remote from the plug. Put the coax 'T' piece in the feeder to the radio and attach the stub to the 'limb' like this:

```
from antenna>-------------------T------------------>to radio
!
!
!
!
! Stub;
+ <- inner & outer shorted.
```

Tune up the radio and the interference should have gone. If not, try two stubs, spaced 1/4 wavelength apart; this will give you at least 30dB of suppression. Attenuation 10% either side of the stub is less than 1dB.
Note that its perfectly safe to transmit through such a stub too; they make a great way of reducing your 2nd harmonic on 6 meters and preventing you being unpopular with FM broadcast listeners. Stubs are also useful for keeping local despatch companies, Police etc. out of your radio if it has a sleazy, zero-selectivity broadband front-end like many handie-talkies.
Transmitting people can trim the 'limb' of the stub for maximum attenuation (or lowest SWR). Be careful though; there can be some dangerously high voltages on the inner if you run even modest power.

Hey, having a Tech ticket means you can run a microwave mountain-topping operation. Does that mean the FCC or some other agency is now responsible for getting you up a mountain? Does the privilege of being trustee of a repeater mean that someone has to give you a repeater? With an Extra ticket, you get the privilege of being able to run a space operation without having to get a waiver. If that's one of the privs, then there have to be SOME questions on the subject. It doesn't matter if you never use the privilege -- you get it. (And, yes, all the astronauts have gotten waivers for space operation but that doesn't mean no Extras have used the privs -- the privilege was defined with an eye toward satellite operation, and extras have put their callsigns on satellites.

|> Here is a more down-to-earth example. To get a ticket you have to pass

|> is the point of asking which designators are required for which class
|> license when there are practical questions that won't get in for lack
|> of room?

Another Extra privilege is being able to be a VE. You have to know something about the tests you are going to administer. Again, it doesn't matter if you personally don't intend to be a VE -- you get the privilege, so there have to be questions covering that privilege.

Licenses aren't custom-crafted; you don't get to say, "I'll never use SSTV, but I will run 1,000 watts, but only on HF, and I'll never be trustee of a repeater -- make me a test." You're effectively licensed for life when you get your ticket, and there's no telling what you'll suddenly find attractive. If there's a privilege, there have to be corresponding questions just so the licensing

authority can say the test corresponds to the

>receivers. Look for the IC-R1A with the cellular telephone freqs.
>deleted.

Then why did they market the R-9000 and R-7000? I don't think ICOM
gives one hoot about the ECPA, I think the Uniden story is a lot more
credible. I would look for a Uniden/ICOM arrangement that allows sale
of the unit here. If the gray market gets them in, Uniden may abandon
the suit since it's pointless.

If I could get one gray market, i'd do it. $300 US for that radio is
a steal!

>the broadband noise is a problem. Of course, I guess we could use
>tubes...

Well lets review for a moment. We are discussing protecting a narrow
band commercial receiver just outside an amateur band from the
emissions of an amateur spread spectrum transmitter. Let's examine
a worse case. Assume another amateur system inside the amateur band.
Now with a SS transmitter spreading a 20khz voice signal over
20Mhz, one one thousandth of the total power of the SS transmitter
will appear in the passband of the narrow receiver. That's a 30db
decrease. Now move the receiver outside the band and use a SAW filter
on the SS transmitter that has ONLY 60db of stopband. Total power
into the receiver will be more than 90db down from the total power of
the SS transmitter. If the SS signal is reasonably clean and keeps
it's intentional radiation inside the amateur band and the narrow
band receiver has any front end filtering at all, we should see
better than 100db isolation. This looks pretty good. As for wideband
noise generated in the final amplifier, we do use tubes. :-)

As a practical example let's take the Grapes 56k modem. With it's
tapped shift register randomizer, it can be considered a somewhat
narrow (70khz) spread spectrum source. On one of our sites we have
one mounted in the same rack with a narrow band receiver operating
300khz away from it's channel center. We haven't noticed any
desense or intermod to the narrowband equipment. We did wind up
adding a cavity to the output of the modem, but that was because
the narrow band equipment was desensing our modem enough we couldn't
copy a weak signal from one of our other modem links.

Now if the SS system is running a lot of power and the narrow receiver is trying to maintain a -140dbm noise floor, THEN we've got a problem. I wouldn't recommend a SS site be colocated with a moonbounce array. Most commercial sites typically want a microvolt or two at their receiver and most proposed amateur SS equipment will run modest power. I don't think there will be any problems at a well engineered site. No doubt there will be problems at many of the poorly engineered sites that I have had the misfortune to use however. One particular site that I am thinking of has 200 transmitters on about 2 acres of mountaintop and the best engineered equipment on the site is in the two amateur installations. We're talking unshielded cabling, unshielded racks, unshielded PAs(!), mobile units pressed into repeater service, and even Radio Shack coax on UHF equipment. With those kinds of problems, they're not going to notice a SS transmitter.

In regards to your getting ahold of the hams when you need us, I assume that you are in the Cornell University area, and there are probably many hams there that handle traffic. You can find out who by having someone send a message to you, and then getting the address and/or phone number of the person who telephones you to deliver the message. (If you dont know of anyone to start a message, please send me your address electronically, and I will send you one.)
Alternatively, you may have a ham club at Cornell, and could find someone through them. Hopefully, the hams have made themselves known to emergency agencies also, so the police, fire, Red Cross, and civil defense agencies can also call on the hams if the need arises.

One of the areas where your argument appears to be quite weak is in the initial response time frame for a widespread emergency. In this case, any "publicly available" resources will be completely saturated by all of the normal users wanting to get on. I am not trying to complain about the phone company or cellular industry here, but to depend on them 100% would be unwise.

It does not follow that adding more spectrum for these services will make them immune from saturation because of the economics of the design of the services themselves. It is simply not cost effective for any communication system to be designed to handle everyone getting on at once for any given coverage area (If they did this, the cost of the equipment would push the rates sky-high, and the competition would take over the business). An example in point is the telephone system. Ma Bell (or Pacific Bell, New England Telephone, etc.) only designs a fraction of the users to be able to get dial-tone service at once. The telephone land-lines could be 100% good, and still if everyone were to pick up the phone at once, people cant talk.

Not only that, but the human response to a problem is to try and get on the system to let people know that you are OK or to request aid. So the human response of the people compounds a capacity problem, with the result of not being able to get through.

In addition to the initial response time being the most problematic to landline telephone and cellular coverage, it is also the most crucial to emergency communications. The initial response period is the period where most of the direct help is provided regarding the immediate safety of life and property, such as: Evacuation notification, Rescuing folks who are trapped by floods, fires, and damaged buildings, Putting out fires, Getting people out of the way of a flood, Providing emergency shelter, food, and clothing, Shutting off energy supplies (gas, electricity) that could cause additional

danger if left on in failed buildings, Preventing radioactive, chemical, or biological contamination of remaining food, water, and air, Determination of the extent of the emergency, etc. These are tasks which can not tolerate a "busy" signal, because lives will be lost or property severely damaged.

Once the above tasks are done (or sometimes mostly done), then people working at the disaster site start being concerned about health and welfare traffic, such as "How is my cousin who might have been in the affected area?"

Amateurs fill in the gap nicely. Most people are probably able to get at least a short-distance (VHF) radio going within the initial response time frame (each one fixing their own radio or antenna, rather than everyone waiting for a small team of technicians, who may be responsible for 30 or 40 sites, plus the communications lines or microwave links used to hook them together), and plans have been put in place in many areas to facilitate assisting the emergency agencies through emergency communications.

Now the emergency agencies have their own communications tools, spectrum, and procedures. Use of internal agency bandwidth solves many problems, but hams can help where (a) there is sufficient cross-agency traffic and the radios for the two agencies do not inter-operate (This is VERY COMMON - just a look at all of the differing police frequencies in the country is very convincing that they will probably NOT be able to communicate outside of their own boundaries), or (b) the agency's own radio system becomes overloaded with emergency traffic or inoperative due to the emergency itself.

That is the theory. On the practical side, this argument is also bourne out.

Hams have helped out in many disasters or problems every month, such as Hurricane Hugo in September 89, and the October 17 quake in Northern California, the Earthquake in Mexico City a few years back, etc.

There are also many that are unknown unless someone writes them up. These include the search for a missing girl in Billerica, the putting out of a particularly bad fire at the Naval Air Station in Whidbey Island, the Crash of Avianca Flight 52 in January, a severe ice storm in Feb 90 that knocked out phone, water, and electricity to several counties, etc.

Well, I hope that this has shed enough light on what value ham radio can be in an actual emergency, and why the commercial providers will not be able to fill the total needs in the immediate response timeframe, that you will reconsider the implications of taking ham radio's bandwidth and giving it to cellular communications. If I personally

were in charge of disaster planning for some geographical area, I would want to include hams in the emergency planning process to maximize the safety of lives and property.

Where there is a will, there is a way....

Actually, all you really *need* is either the upper or lower half of the main lobe, ala SSB. Periodically chipped BPSK (and QPSK, for that matter) exhibits phase periodicity at the chip rate (half the main lobe width). But.. the signal processing gets real ugly when you try to generate, transmit, receive, and then reconstruct such a beast. In an application of our type this would only be of interest in a very spectrum-limited situation.

Just in case someone cared...

4800. Qualification-based licensing

Newsgroup: rec.ham-radio
Date: 1990-07-31 21:00:26 UTC
From: goldstein@carafe.enet.dec.com
Message-ID: <14117@shlump.nac.dec.com>
Source record: 9706

QUALIFICATION-BASED LICENSING

The FCC's proposal to create a new no-code class of license may be a useful first step, but it does not go far enough towards addressing the problems with the American amateur licensing structure. The fundamental premise upon which licensing should be based has long been lost; the new proposal is an inadequate step towards reclaiming it.

When someone applies for a driver's license, the state tests them on both written knowledge (of the rules of the road) and practical skills required to drive a car. When someone applies for a private pilot's license, the FAA tests them on both written knowledge and practical skills required to fly an airplane. When someone applies for admission to the bar in order to practice law, the Bar Examiners test them on knowledge of the law. These candidates are not tested on repairing magnetos, celestial navigation and golf. They are tested on the skills required to safely and competently use the privileges granted.

Yet the amateur radio licensing debate has almost never even mentioned this fundamental concept. Instead of testing applicants on required skills and knowledge, applicants are expected to learn various the arcana of theory and (at least today) Morse Code. While some of these are directly relevant to the field of amateur radio, the actual license classes do not grant privileges in line with the tested skills. The current "incentive" licensing structure has become capricious, granting access to a public resource -- the spectrum -- based upon a general level of knowledge largely irrelevant to the privileges granted. Instead, privileges are granted as a reward for learning what the system believes should be learned. The spectrum has become a Merit Badge. Is this the type of structure that can withstand increasing scrutiny and pressure from other applicants for spectrum space?

I would like to propose, then, that once the dust settles on Docket 90-55, we readdress the entire licensing structure with an eye towards making amateur radio more attractive to newcomers, while ensuring that the airwaves are only open to those who, like pilots in the sky, have demonstrated the requisite competence to use them as they do. This means that licensing should be simpler, both in structure and in requirements. But not only the requirements to obtain licenses, but the privileges granted to licensees, should be revamped.

The present proposal (FCC 90-55) seeks to reassure the existing amateur community that all existing privileges will be retained. This is a politically useful goal for the short term, but it stifles any possibility of creative change. Are we willing to allow a few privileges to be taken away from some amateurs, in exchange for others? If we think

not, then what if it is necessary in order to create a positive growth rate, as may be needed to preserve our spectrum?

Amateur Radio should be inclusive, not exclusive

Much of the support for a no-code license seems tempered with a twinge of guilt: No-code is only acceptable, many of us have said, if it is accompanied by a more difficult theory examination. This seems to be a defensive view, designed to defend against claims that we are "giving away" too much, or opening up our bands to the "riff raff". Visions of the eleven meter mess are invoked, as if the only difference between CB and ham radio were the code.

But it is wrong to condemn CB! While only a few hundred thousand Americans hold amateur licenses, several million are squeezed onto forty channels, forced to use AM emission, with sporadic-E skip adding to the chaos. It only takes a few bad apples with illegal power and zero courtesy to create a mess. Does this mean that everyone on that band is bad? Is everyone in a neighborhood guilty of the crimes of one neighbor? Of course not. CB was destined for chaos by its poor design. Millions of CBers are well-mannered and desire the same kind of orderly bands that we like to imagine that we have (although that claim is often hard to justify). They just aren't given an adequate opportunity to join us.

I propose that we replace our current "incentive" licensing structure with a more modern "qualification" based system. The premise is simple: Each license class can be achieved by demonstrating the knowledge required to use the privileges it grants, no more, no less. This is only tempered by the expediency of keeping the structure simple and thus limiting the number of classes.

Just as we had only three classes during the 1950s and early 1960s, when amateur radio had it biggest growth years, we can survive on three basic classes today. They just need to be modernized -- radio isn't what it was in 1950, or in 1966 when Incentive Licensing was decided.

Entry-level requirements

An entry-level license is a marketing tool. It should be easy enough to earn that potential applicants are not repelled, yet should be difficult enough to guarantee that its privileges are understood. The traditional definition of the Novice written examination seems to be proper: Amateur radio regulations and sufficient theory to understand them. Not an engineering degree. Not advanced mathematics. Not digital communications expertise. Just enough theory to understand how to operate an amateur radio station within the rules. This Novice examination should include basic operating practices, simple electronics (Ohm's law, electrical safety, etc.), and relevant regulations. The number of questions is irrelevant if the pool is large enough, but a 30-question multiple choice examination seems about right.

The existing Novice privileges are not selling. Thirty years ago, the ability to "work the world" on the HF bands was a selling point, but

today it's possible to dial up a telephone call to Paris or Sydney. CB and cellular telephones have taught people that chatting on a radio can be fun. This type of activity is mostly on the VHF bands. So the entry-level ticket can be a VHF license, like the proposed Communicator, and of course should be codeless. It should be easy, because it serves a marketing function, and relevant to the privileges earned. Start with the current Novice written exam, modified for more VHF emphasis. And stop before it gets harder!

These licensees should not be "ghettoized" in narrow bands where they are not exposed to mainstream amateurs. The Novice-level license should be allowed on all VHF and UHF bands, especially the popular FM and digital frequencies. They should not be allowed to operate in the small areas used for weak-signal operation, which requires a higher degree of skill. But how much theory does it take to operate an FM transceiver? Not much. Qualification-based licensing reflects that. It also means that a Novice, with little knowledge of the dangers of VHF power, should be limited in power. The current Novice limits seem sensible -- 5 watts on microwaves (902 and up) is plenty, while somewhat higher power levels are adequate for most voice and packet operation. Modes should also be unrestricted; a Novice should be allowed to use any mode that is permissible within the authorized frequencies. This does not include the right to own a repeater.

Does the entry-level ticket need HF privileges? Perhaps, but here we can see some reasoning for requiring the code. A no-code Novice can thus be granted HF privileges (say, the current Novice ones) for passing a 5 WPM code test. The FCC can simplify this by using a CSCE process, so long as the applicant need not use the suffix (i.e., /KN) after the FCC has been given sufficient time to update its records to reflect the endorsement (say, 30 days).

General license

The next license will grant general HF privileges, so it can be called the General. Morse code is less important today than it used to be, so a 5 WPM code test is adequate -- if someone wants to use CW, they'll learn to go faster! The General written exam should be harder than the Novice, as it needs to cover more HF propagation, additional operating procedures, and more theory needed to understand these additional privileges. Today's Technician and General exams have the right idea, though it seems unnecessary to have separate VHF and HF elements. Let's go back to the level of the 1960's Technician exam, which had the General written exam and a 5 WPM code test. Current Technician and General licensees can be merged into this one class, further simplifying the system.

What privileges does this new General earn? With a modest technical background but a general understanding of the Amateur service, all bands and all modes seem appropriate. But almost every country that has multiple license classes, outside of the United States, recognizes that high power operation requires a higher degree of knowledge and skill.

The General can thus be power-limited to, say, 250 watts PEP output, after a transition period. But it gains larger sub-bands, today's Advanced level, in return.

One higher class

A few sub-bands may still be reserved for the highest class. Again two existing classes can be merged here. The misbegotten Advanced, created for the 1966 Incentive Licensing program, can be merged with the Extra. This can be earned via the current Advanced examination (13 WPM with additional theory beyond the General); all existing Advanced licensees thus gain Extra privileges. In addition to the right to run maximum legal power, the top class can still have some small sub-bands reserved for it, along the lines of today's Extra bands. The higher code speed is, after all, relevant to the type of DX operation pursued in the Extra sub-bands; the greater theory is relevant to high-powered operation.

Perhaps an "Extra" license class can be preserved, complete with a 20 WPM code test. But it needn't be the FCC's! In reality, the top rung of the Incentive Licensing ladder is more of a Merit Badge than a credential. Perhaps the ARRL or some other organization can give it out as an earned award, valued for bragging rights and wallpaper value, just as it was before 1967. And if call sign assignment is ever privatized, the Extra holders can stand on the front of the line.

The names of some licenses may need to be addressed too, to avoid inappropriate connotations. "Novice" implies temporary. But it no longer is temporary, and an entry-level license need not be. If you're qualified, you're qualified! "Communicator" carries baggage of its own. And what about the Morse-endorsed version? Novice Plus? It may be close to today's Technician in privileges, but when that name was introduced in the 1950s, it was meant to imply that its holders were well versed in the arcana of then-obscure VHF lore. In some countries, a codeless VHF ticket is called "Class B". This or some other neutral name may be most appropriate for the entry-level ticket. An endorsed one can be nicknamed "B Plus". (Maybe old tube fans will get a charge out of it.) "General" and "Advanced" are sufficiently neutral terms to keep for the higher classes.

In summary, we end up with three and a half license classes:

1) Class B - No code, easy test. Most VHF privs, power-limited.
1.5) Class B + 5 WPM - Class B plus current Novice HF privs.
2) General - 5 WPM plus General written test. 250W, all bands except current Extra sub-bands.
3) Advanced - 13 WPM plus Advanced written test. All privs.

Current Novices become Class B+, current Technicians get the General, and the Extra is grandfathered as a "merit badge" class.

This simplifies the licensing structure, puts privileges in line with the examinations, and provides a marketable entry-level license. Most current licensees gain privileges. The only major loss, to today's

General and Technician classes, is to the power limit, and both gain frequencies in return. Incentive Licensing was a disaster. Perhaps Qualification-based licensing can begin to undo the damage.

Does anyone have experience using the 6 meter ham band
for radio control boats or aircraft? I know there are
some freqs like 50.1 50.2 etc that we can use. Can
manufacturers of this equipment be easily found?

Please reply via Internet email.

Thanks, 73 de Rick

Re: NICAD CELL CHARACTERISTICS

I've heard a theory that "memory" is the product of two modes of misuse - not completely discharging the cell, then overcharging the cell. While not disagreeing with an excellent article, I'm offering another remedy for vanquishing the "memory effect": don't overcharge to the point that it heats up the cell.

I'm not particularly attached to this theory, and wouldn't mind hearing substantiating or contrary evidence. Note that most commercial cell-boilers with Temp Cut Off thingies overcharge a cell.

kline@ux1.cso.uiuc.edu (I) write:
>My IC-24AT allows me to enter frequencies in the cellular band when I
>enable extended receive, but claims that the synthesizer won't lock up
>in that range. Since it locks up solidly just above this, in the 902MHz
>band, I wonder if it's just lying to me and was programmed not to allow
>reception at these frequencies by faking an unlocked synthesizer.

Since this made the rounds I've gotten several pieces of mail from
people whose 24AT's WILL lock up in those frequencies. Mine must be a
funny one, I guess. My hypothesis that the 24AT might be programmed to
not receive the cell band was reinforced by the fact that mine also
loses lock at EXACTLY 451.00MHz and regains it at EXACTLY 500.00MHz,
thus very elegantly excluding the UHF public service (i.e. police)
frequencies.

Obviously I'm wrong and my radio is just being fascist all by itself.
Thanks for the corrections.

In article <690@hayduke.slc.unisys.com>, I blurted:
>
> Actually, all you really *need* is either the upper or lower half of the
> main lobe, ala SSB. Periodically chipped BPSK (and QPSK, for that matter)
> exhibits phase periodicity at the chip rate (half the main lobe width).
> But.. the signal processing gets real ugly when you try to generate,
> transmit, receive, and then reconstruct such a beast. In an application of
> our type this would only be of interest in a very spectrum-limited
> situation.
>
I may have said something misleading there in my $.02 worth.

What I said is true for BPSK because the amplitude of the spectrum
is symmetric about the carrier. Thus, with symmetric amplitude and
periodic phase, half the main lobe gives you everything. QPSK, while
having the same phase period, does not necessarily have symmetric
amplitude. You still need the whole main lobe for that. :-[

Possible application: additional diversity. If your main lobe is too
junked up by all those spectral co-users, then maybe one half of the main
lobe, by itself, is OK.
